THE AMATEUR'S GREENHOUSE.

By T. W. SANDERS, F.L.S., F.R.H.S.,

Editor of "Amateur Gardening" and "Farm and Garden." Author of "Encyclopædia of Gardening," etc., etc.

A COMPLETE GUIDE TO THE CONSTRUCTION, HEATING AND MANAGEMENT OF GREENHOUSES; PROPAGATION AND CULTIVATION OF GREENHOUSE PLANTS; INSECT, ANIMAL, AND FUNGOID PESTS, AND HOW TO ERADICATE THEM.

To be obtained by order from any Bookseller; or will be sent, post free, packed in box, for 5s. 6d., by the Publishers.

W. H. and L. COLLINGRIDGE, 148 and 149, Aldersgate Street, London.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

The Leading American Seed Catalog for 1910.

AN ELEGANT BOOK OF 178 PAGES,—it is "THE SILENT SALESMAN" of the World's Largest Mail Order Seed Trade. It tells the *plain truth* about the Best Seeds that can be grown,—as proved at our famous FORDHOOK FARMS,—the largest, most complete Trial Grounds in America. Handsomely bound with covers lithographed in nine colours it shows, with the six coloured plates, Nine Novelties and Specialties in unequalled Vegetables, and five of the finest Beautiful New Flowers, including two superb "Gold Medal" Spencer Sweet Peas.

With hundreds of illustrations from photographs and carefully written descriptions it is a SAFE GUIDE to success in the garden, and should be consulted by every one who plants Seeds, whether for pleasure or profit. While too costly a book to send unsolicited (except to our regular customers), we are pleased to mail it **FREE to every one** who *has a garden* and can appreciate QUALITY IN SEEDS. Shall we mail YOU a copy? If so, kindly *name this paper* and **write TO-DAY**!

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Past and Present.

Although the year that reached its course during the past week was, on the whole, more satisfactory from the horticulturist's standpoint than was for a considerable period during the summer regarded as probable, it had many disappointments, and compared unfavourably with its immediate predecessor. The promise of an abundant fruit harvest failed in being realised owing to the low temperature, accompanied by severe frosts, that prevailed during the blossoming of the apple, pear, and plum trees. Strawberries also suffered from the late frosts, but the injury to the early flowers by frost was as nothing compared with the serious damage to the fruit that was caused by the frequent rains that fell during the period of ripening. The wet weather not only prevented the fruits attaining their proper colour and flavour, but rendered it impossible for them to be marketed in a satisfactory condition. Gooseberries and raspberries were abundant, but poor in quality, and as a large proportion of the fruit had to be sent to market in a moist state, the prices ruled low. Vegetable crops were, generally speaking, excellent, more particularly green vegetables. Potatoes also were good, although not equal to the record crop harvested in 1908. The estimated yield of tubers was about one ton above the average of the previous ten years, and the quality, except on heavy soils, was of considerable excellence. In most cases the growth was rather too vigorous in the flower garden, but hardy plants attained their full development and retained their attractiveness for a longer period than usual, the difference being very marked on light soils. Some of the more tender of the half-hardy fine foliage plants failed to assume their rich colouring, and the zonal pelargoniums flowered less freely than usual, but with those exceptions the half-hardy plants in flower garden decoration were more or less satisfactory. Seldom have garden lawns retained their fresh green colour throughout the summer in the same degree as last year; but unfortunately, the frequent rains which promoted the growth of the grasses reduced the opportunities for the full enjoyment of the garden and of garden games. Turning from the garden to the societies whose primary object is the advancement of horticulture, the splendid work that has been accomplished by the Royal Horticultural Society at once calls for notice. The Temple Show was horticulturally a splendid success, and the exhibition at Holland Park was the best that has yet been held in the grounds of Lady Ilchester's historic residence. To both shows the weather was unkind, and the financial results must have fallen short of those of some previous years; but these gatherings have become so popular that unfavourable weather does not influence the attendance to the same extent as in the case of the majority of flower shows. The fortnightly meetings which form a very important part of the society's work, have been well maintained both in interest and attractiveness, and the lectures have been of a high order of merit, the Masters' lectures by Professor de Vries calling for special mention. The competitions for the prizes offered at these meetings for fruits and vegetables were rather disappointing, and this year they will be replaced by an exhibition in May of vegetables grown under intensive culture, and a show in October of British-grown fruits. During the year the Floral Committee celebrated its jubilee, and to mark the event the members, with those of the Fruit Committee, which completed its fiftieth year of activity in 1908, were entertained at dinner, at which Sir Trevor Lawrence, Bart., presided. On the other hand, the Royal Botanic Society has a very poor record, for, owing to financial difficulties, it was not able to hold either a spring or summer show. It has, we understand, been giving special attention to its financial position, and as the result, has been able to make a substantial reduction in its liabilities, which at one time gave rise to much anxiety. To make a strenuous endeavour to adjust the expenditure to the income is desirable up to a certain point; but it is impossible to lose sight of the fact that when the expenditure has to be so reduced as to render a society unable to carry out any of its objects, it is impossible to find a justification for its existence. As we have previously stated, the position of the Royal Botanic Society is far from satisfactory, and not until the Council has been reorganised and a due proportion of horticulturists of position and ability placed upon it, can any improvement in its affairs be expected. We had hoped that something beneficial to both the "Royal" societies in London would have come of the negotiations between them, but as will be gathered from the letter from Mr. Wilks that we publish on another page, the hope has failed in its realisation. The difficulties in the way of amalgamation may have been insurmountable, but it ought to have been possible to have entered into an arrangement, on terms beneficial to both societies, for the Royal Horticultural Society to have had the use of the Regent's Park Gardens for its summer exhibitions, provided, of course, it so wished. The special societies that have their headquar-

MR. GEORGE PAUL, V.M.H.

ters in London have for the most part had a successful year. The success of the National Rose Society has been phenomenal. It issued a catalogue of roses in which all the best varieties for exhibition are described, and selections given of the varieties best suited to various purposes, and other publications. The membership increased by leaps and bounds, with the result that the number of members closely approaches 4,000, and the funds have been so carefully administered that the reserve fund already amounts to a substantial sum. Highly successful also has been the National Sweet Pea Society, which has nearly 1,000 members, and is doing splendid work. The success of this society is of special interest from the fact that a decade ago the idea of holding a show of sweet peas was declared by some of the leaders in horticultural matters as so absurd as to be unworthy of a moment's consideration. Others asserted that the sweet pea had attained to the highest state of development of which it is capable, and the value of this assertion can be very readily determined by a comparison between the varieties of ten years ago and those of the present day. The National Chrysanthemum Society has somewhat improved its position, the National Carnation Society and the Perpetual-flowering Carnation Society have held excellent exhibitions, and the National Dahlia Society has been strengthened by its amalgamation with the London Dahlia Society. The society would probably have been in a stronger position had it concentrated its efforts upon one exhibition. It has decided to hold two exhibitions this year, but it has arranged to hold a conference in March next, and at this we hope the importance of dahlias for garden decoration will receive special attention. The great provincial exhibitions at York, Wolverhampton, Hanley, Leicester, Shrewsbury, and Edinburgh were fully equal to the high average of late years, and their sustained popularity was evidenced by the immense numbers of visitors who availed themselves of the opportunity of seeing what is best in present-day horticulture. The Royal Caledonian Horticultural Society celebrated its centenary last year, and all who are acquainted with the work the society has done, and is doing, cannot well repress a feeling of regret that it is not receiving the support it so fully deserves. One new national society was formed during the year, and if it receives such support as will enable it to carry out the work on which it has entered on the lines laid down, it should render valuable service to those engaged in the cultivation of vegetables. In September next it will hold an exhibition which has the promise of being of exceptional importance and interest. The holding of exhibitions is not the only work in which a special society should engage, and recognising this fact, the committee of the National Vegetable Society are carrying out trials of autumn-sown onions and spring cabbages. The year that has passed, if not equal to the anticipations that were indulged in at its commencement, gave, regarded as a whole, a fairly good return to those engaged in the affairs of horticulture; and, taking a broad view of the present position, there appears full justification for looking forward with a spirit of hopefulness to that which the year on which we have just entered will bring as a reward for the cultivator.

Mr. George Paul is so widely known among garden lovers and those actively engaged in horticultural pursuits that in presenting his portrait there is no occasion to do more than briefly refer to the splendid work he has accomplished in the course of his active life. Quite early in life Mr. Paul evinced much interest in horticultural matters; and on leaving school he joined the Cheshunt firm, and assisted his father, the late Mr. George Paul, in the business until 1867, when, on the death of the latter, he assumed the entire management. That Mr. Paul had been careful to take the fullest advantage of his opportunities for becoming well acquainted with the several departments is evident from the success he achieved in increasing the high reputation the Cheshunt firm then enjoyed, and in greatly extending the sphere of its activities. There is no occasion to state that these nurseries were closely associated with roses and rose culture at the time when Mr. Paul was preparing himself for the responsibilities which at so early a period in his career he had to assume; but it may be mentioned as a matter of interest that the first seedling rose he remembers flowering was the Duke of Edinburgh. Whatever may have been the effect this rose had upon Mr. Paul, we know that in three years after he had become the head of his firm he commenced the distribution of a set of new roses raised by the late Mr. Thomas Laxton. In 1873 the two fine Cheshunt raised roses, Reynolds Hole and Cheshunt Hybrid, were distributed, and these at once became popular and long held a foremost position. The list of roses raised at Cheshunt since the introduction of the two varieties last mentioned would be a formidable one; and with regard to them it need only be said that they have all possessed much merit, and included both garden and exhibition varieties. Of late years Mr. Paul has devoted much attention to the raising of roses especially adapted to garden decoration, and, assisted by his son, Mr. G. Laing Paul, one of the keenest of rosarians, he has introduced many valuable garden varieties. While achieving success of a high order as a raiser, cultivator, and exhibitor of roses, Mr. Paul has not allowed them to occupy the whole of his attention. He was one of the first to appreciate the importance of alpine plants and hardy perennials, and twenty-nine years ago he established at Broxbourne a nursery specially for their culture. Mr. Paul was equally quick to appreciate the value of hardy trees remarkable for beauty of flowers or foliage, and the collection he has formed at Cheshunt proves to demonstration his thorough acquaintance with the many kinds now in commerce. For some years Mr. Paul was a member of the Council of the Royal Horticultural Society, and has long been a vice-chairman of that society's Floral Committee. He has for some years been a member of the Herts County Council, and has taken a very active part in the educational work of that body, and, as evidence of the appreciation of his public services, it must be mentioned that he is a justice of the peace for the county.

Congratulations to Mr. Conway Jones.—That a prophet is not always without honour in his own country was made evident at the recent annual meeting of the Gloucestershire Rose and Sweet Pea Society, over which Mr. Conway Jones, Chairman of Committee, presided. At the conclusion of formal business Mr. Holbrook expressed on behalf of the members their "very hearty congratulation to Mr. Conway Jones upon having attained what he believed was the ambition of his life. He was now the amateur champion of Great Britain. He was sure everybody who took a great interest in roses must have felt very proud to know that their neighbour and friend Mr. Conway Jones had, after so many years coming in second, at last come in first. They were particularly pleased, because Mr. Conway Jones was not selfish in his love of the beautiful flower. Having the pleasure of living next door to him, he had seen the numbers of people who came up to see his roses, and the way in which he showed his flowers. The help he gave by his advice had done much, not only to make the rose show a success in Gloucester, but to give an impetus to the growing of the rose, our national emblem."

Waterside Boulevard for Wandsworth.—The Rev. J. H. Anderson, rector of Tooting and chairman of the Special Works Committee of the Central Body dealing with unemployment, recently suggested that the banks of the busy but not very pretty river Wandle should be reclaimed, and that walks should be made and trees planted so as to transform the banks into a pleasant riverside boulevard. The scheme has been approved, and the Local Government Board has agreed to grant £1,000 towards it, as the work will give employment to many men for several months.

Provincial Flower Shows.—The dates of the following provincial exhibitions are as under: York Floral Fête and Gala, June 15, 16, and 17; Wolverhampton Flower Show and Fête, July 12 and 13; Shrewsbury Flower Show and Fête, August 17 and 18; Edinburgh Fruit Show, September 7 and 8.

Peter Barr Memorial.—We understand that an effort will be made to raise sufficient money among lovers of daffodils, pæonies, asters, and other hardy flowers, for the purpose of maintaining an orphan through the medium of the Royal Gardeners' Orphan Fund, as a fitting memorial to the late Mr. Peter Barr. A Peter Barr medal will also be struck and awarded each year in connection with progress among daffodils. The Narcissus and Floral Committees of the Royal Horticultural Society have become associated as a general committee for the promotion of the memorial, and each of these bodies has nominated five members to form an executive committee to put the matter in motion. This executive body consists of Mr. H. B. May, Mr. W. Marshall, V.M.H., Mr. C. E. Shea, Mr. J. T. Bennett Poë, V.M.H., Mr. W. Cuthbertson, Mr. Walter T. Ware, Mr. R. Hooper Pearson, Mr. W. Poupart, Rev. J. Jacob, and Mr. C. H. Curtis, who will meet on January 11 at the Royal Horticultural Hall.

Societe Francaise d'Horticulture de Londres.—The annual dinner of this society will be held on the 21st inst., and as the society celebrates its twenty-first anniversary this year the dinner will be of exceptional interest. M. Philippe de Vilmorin is coming specially from Paris to preside, and a large gathering of horticulturists interested in the excellent work in which the society is engaged is anticipated.

The Late King Leopold of Belgium was a great friend and patron of horticulture, and did much to bring about the great horticultural activities for which Belgium is famous. He had beautiful grounds and gardens around his palace at Laeken, a fine winter garden, and a little way from the palace gardens proper he had a splendidly equipped range of glass houses, covering a considerable area and largely devoted to the propagation of economic plants. For many years the late

Mr. Knight, an Englishman, was the king's gardener, and the relations between the two were of the most cordial character. At the great Ghent Quinquennial exhibitions the king made a point of being present to perform the opening ceremony, and those who were present at the last great show, in 1908, will well remember the keen interest he took in the English exhibits, notably the orchids and amaryllis contributed by Lieut.-Colonel Holford, of Westonbirt, Gloucester.

Chrysanthemum George Hemming.—Mr. Edwin Molyneux writes: I much regret that, when describing Chrysanthemum G. Hemming, through a slip of the pen I represented it as a decorative variety. On reference to my notes taken at the National Chrysanthemum Society show at the Crystal Palace, I see they are "G. H. (Mileham), 8 x 7in., rich amaranth, quite full on the surface, a very promising variety." I am exceedingly obliged to Mr. Mileham for drawing attention to the error, and at the same time beg to assure him that I do see all the new chrysanthemums that I write about, preferring this to secondhand evidence, and I know my descriptions and opinions of the new sorts are valued by many who have not the opportunity of seeing the new varieties themselves, and for these I specially write.

Presentation to Mr. T. Swift.—After over forty years' service with Messrs. Hurst and Son, the wholesale seedsmen of Houndsditch, Mr. Thomas Swift has retired from active business. The goodwill of the past and present employees was shown a fortnight ago when he was entertained at dinner at the London Tavern, and presented with a silver centrepiece, and two silver vases.

Irish Potato Crop, 1909.—The Department of Agriculture and Technical Instruction for Ireland has issued an estimate of the yield of potatoes in Ireland last year. From this we learn that the average yield of the potato crop in Ireland in 1909 is estimated at 5.5 tons per statute acre, as against 5.4 tons in 1908, and 4.4 tons for the ten-year period—1899-1908. The acreage of the crop in 1909 amounted to 579,799 acres, as against 587,144 acres in 1908, a decrease of 7,345 acres, and the total produce of the crop in 1909 is estimated at 3,202,819 tons, as against 3,199,678 tons in 1908. The quality was on the whole very good. The returns show that in most of the southern counties the crop exceeded that of 1908. Thus the average rate for the province of Leinster was 5.4 tons in 1909 per statute acre, as against 4.9 tons in 1908. In Munster the average was 5.4 tons in 1909, as against 4.7 tons in 1908. In Connaught the yield was 5.5 tons in 1909, as against 5.2 tons in 1908. In Ulster, taking the whole province, the average rate was lower than in 1908—viz., 5.7 tons in 1909, as against 6.2 tons in 1908. The returns indicate that in many of the northern counties the yield of sound tubers last year was more than usually uneven.

Gardeners' Magazine Almanack.—With our next issue (Jan. 8) we shall present a handsome almanack, printed in colours, and including the dates of the principal horticultural exhibitions and meetings arranged for the current year. The number will contain special articles dealing with seasonable subjects and many illustrations. As there is invariably a largely increased demand for the issue with which the almanack is published, we strongly advise those of our readers who may require additional copies to give their orders well in advance of the date of publication.

SHOULD FRUIT TREES BE CULTIVATED?

Nothing of late years has created more interest in fruit growing circles than the reports on the Woburn experiments, the results of which are more or less opposed to the general way of thinking, and the pointed remarks in the recent leader, entitled "Problems in Fruit Culture" (page 965), give further food for thought. At the conclusion of the review of the Woburn report it is quite fitting to ask the question, "Should fruit trees be cultivated?" because this is just what the results of the Woburn experiments leads us to, and the sooner the matter is made absolutely clear the better. Let me quote a sentence from the article in question: "In the results obtained at Woburn in the planting, pruning, and manuring of apple trees, we have the suggestion that the care which growers have taken in carrying out these details have been unnecessary." Just so, but let us remember that the details referred to have been carried out by successive generations of gardeners and fruit growers in all parts of the country, and it may be fairly assumed that these have obtained good results from their methods; indeed scores of instances might be quoted to prove it, and the point is whether better results would have been obtained if those details had been neglected.

To put it in another way; we have the evidence of scores of capable men to show that the carrying out of details, which the results of the Woburn experiments would suggest are unnecessary, have resulted in the growth of good trees and the production of fine crops of fruit, while, on the other side, there is the evidence of the report referred to. I do not know of anything else.

I do not question the figures given in the report, nor the conclusions drawn from them, and, on the other hand, would welcome any method of culture that would save expense in time and labour, and give better results, but I do think it should be made very clear as to what is meant by careless planting and non-pruning. It would be a pity for an idea to get spread abroad that attention to fruit trees is unnecessary, and the more badly they are treated the better they will do. I do not think this is what the Woburn reports wish to convey, but it is a conclusion that may be arrived at by some, and if the question raised as to whether fruit trees should be cultivated, is answered in the negative, what are we to understand? Apparently there would be no reason why areas of land should not be planted with fruit trees and turned into fox or game coverts, if the trees do not require pruning or manuring, or anything.

May it be assumed that the term "cultivation" means planting, pruning, and manuring, which are, of course, the chief points? I am writing with a knowledge of the West of England, where thousands of trees are grown in grass orchards, and the method I advise is to mark the site where the tree is to grow, take off the turf in a circle about 4ft. in diameter, remove the top spit of soil, and loosen the ground in the bottom; then cut up the turf, put it in the hole, tread it down, place a little of the best soil taken out over it, fix the stake, and plant the tree, covering the roots with three or four inches of soil, making it firm, but not ramming. No turf is allowed to grow up to the stem of the tree for a few years, and this I consider, is very important. Would this be called careful planting, according to the Woburn standard, and, if so, what is careless planting? Would it cost less, and would the results be decidedly better?

There is a system not unknown in West Country orchards, described jocularly as "post hole" planting, which I should call the essence of carelessness. It consists of digging out a hole in the turf just big enough to accommodate the roots, and with little regard for depth. The roots are crammed in, the soil put back, and the sod or two of turf replaced. Surely nothing could be more primitive or careless, if the latter is a better word, and the stunted state of many trees so treated do not speak very much in its favour. What we want in these parts is to induce people to pay more attention to their orchard trees, and treat them more seriously, which can hardly be consistent with any doctrine of carelessness. On the other hand, I fear that the dilapidated state of so many West Country orchards, which have become objects of derision, is the direct results of carelessness.

Now a word about pruning. In the leading article is the statement, "According to Mr. Pickering, the less pruning done, consistent with keeping the trees sturdy and in shape, the better." Surely, in the name of all that is reasonable, this is the law and the prophets, so far as the pruning of a standard tree is concerned. It is the doctrine we have preached for years. Keeping the tree sturdy and in shape, what more is wanted? I do hope that this point about non-pruning will be clearly understood, and that it will not lead to more planting of trees and never touching them with a knife as long as they stand. We have too much evidence of this now—trees planted and not pruned back, bearing a few useless fruits about the second season, but at the expense of growth, and then standing still until they have recovered themselves. I should not like to say how many lanky, ill-formed trees there are in West Country orchards which are like this, simply because they were not cut back after they were planted, so as to start them to grow, which is the first business of a fruit tree.

Now turn to the old or established trees, hundreds, thousands of them, so thick in the head that they are a mere conglomeration of dead wood and crossing branches, and so congested that it is almost impossible to see through them. What sort of fruit do these specimens bear (except, perhaps, the young branches on the top, which get the light)? Ask the man in the market, he will tell you. This deplorable state of affairs is the result of absolute non-pruning, and we certainly want to differentiate between non-pruning and the judicious periodical thinning from youth upwards which is essential in order to keep trees "sturdy and in shape." When people with limited experience read the word "non-pruning" in the report of an experiment they are apt to jump at the wrong conclusion.

I gather from the review of the report that dressings of manure during fifteen years at Woburn have had no appreciable effect upon the trees or crops, and the obvious conclusion from this is that manure is not necessary for fruit trees. I wonder what market men will say to this, but, confining myself to orchards, where do the farmers get their best apples? In the orchards near home, where the pigs and calves have access, where the poultry run, where animals are fed with cake, and where the contents of overflowing liquid manure tanks are emptied from time to time under the trees. That is where.

More than once I have compared the growth of trees in such orchards, and the character of the fruit, with the conditions prevailing in orchards away from the homestead, where land is not rich, and no manure has been given, and the contrast supports the contention that to grow good fruit in an orchard you must do it well.

In conclusion, I may say that my remarks apply only to standard trees in grass orchards, and in respect of these I trust there will be no misconception as to what is actually meant by careless planting and non-pruning; as it is very undesirable that people (I refer only to the careless ones) should be induced to pay less attention to their trees than they do already.

G. H. H.

ROYAL BOTANIC SOCIETY.

Subjoined is a copy of a letter sent to the chairman of the Royal Botanic Society in reply to the memorandum received by us from him dated December 7, in connection with the efforts which have been made by the Royal Horticultural Society with the object of securing a continuance of the Regent's Park Gardens, and safeguarding the rights and privileges which the Fellows of the Royal Botanic enjoy at present therein.

W. WILKS,
Secretary.

Royal Horticultural Society,
Vincent Square,
Westminster, S.W.,
December 22, 1909.

S. Pembroke Stephens, Esq., K.C.,
Chairman of the Royal Botanic Society.

Dear Sir,—Having considered the Royal Botanic Society's memorandum of December 7, together with that which was drawn up at Mr. Pembroke Stephens' request by the Secretary of the Royal Horticultural Society on Wednesday, November 26, as a précis and record of the various proposals and suggestions which had been made on one side or the other at the meeting of the Joint Committee of the two societies, the President and Council of the R.H.S. wish in the first place to congratulate the President and Council of the R.B.S upon their anticipated emergence from the critical position set forth in their circular of November 6.

In view of such happy prospects, it does not appear to be either necessary or desirable to continue negotiations begun under an entirely mistaken idea, produced by the circumstances which led to the circular of November 6. Also, it does not seem worth while to enter upon any of the points raised in the R.B.S. memorandum of December 7, except to say this, that the memorandum drawn up on November 26 by the secretary of the R.H.S at Mr. Pembroke Stephens' request, was in no sense to be regarded as a scheme emanating from the R.H.S., but simply and solely as a memorandum incorporating the general tenor of the principal suggestions which had been made on one side or the other at the preceding meeting, and that it was not therefore surprising if a congeries of suggestions contributed by a number of persons should not represent a workable whole. It is needless to point out that such a memorandum binds neither society; it is merely a précis and record of the chief points brought under review, and suggested at the meeting.

Should, however, the "difficulties" apprehended on November 6 unfortunately recur, the R.H.S. will be prepared to consider any reasonable proposal for preserving the gardens for their present uses, and continuing to all Fellows and debenture-holders of the Botanic all their existing rights and privileges therein.—Believe me to be, faithfully yours,

W. WILKS,
Secretary, R.H.S.

By order of the
President and Council.

SWEET PEA NAMES AND NAMING.

The following paper was read by Mr. W. J. Unwin, at the Conference held by the National Sweet Pea Society on the 10th inst.:

It has been announced that I would tonight read a paper on the "Names and Naming of Sweet Peas," but, interesting as this subject may be, I am fully convinced that it will be useless to discuss the naming of new varieties until some steps can be taken to safeguard these varieties after they are named.

I do not therefore propose to deal particularly with the naming of sweet peas, but rather to outline a scheme by which I believe growers may be more safeguarded in making their selections of distinct varieties. If I were to detail the various reasons why this or that firm should or should not give different names to what may be practically the same variety, it would be more or less a waste of time, as I am convinced every raiser would follow his or her own inclination in the matter. It is, so it seems to me, the duty of the National Sweet Pea Society to help the growers, so that they can make their selections with more confidence, but under the present conditions even experts are baffled. Our society is already doing good work, but more must be done if we are to know, with more certainty, which new varieties are worth growing.

The society cannot prevent unfixed stocks being sent out, but it could debar unfixed new varieties from being staged in competitive classes at its shows. As a remedy, I suggest that all new varieties in future shall be sent to the trials, and only those that proved to be fixed shall be eligible for entry in any of the society's competitive classes If the society is firm in this matter growers would soon know which varieties to grow and who to look to for more reliable information than we have at present.

I next venture to suggest that a more detailed account be given by the society of all fixed stocks, as to their type and colour, and whether they are quite distinct, or how they compare with varieties already in commerce. Unless any of the unfixed stocks are of special merit they must not be mentioned. It seems useless to waste time over varieties that are badly mixed and of no particular merit. It will be readily seen that if the society allows only fixed varieties to be staged in the competitive classes and publishes a fully detailed report of the trials from the Floral Comittee, the growers will be safeguarded to a great extent, and I believe this work would eventually prove a real benefit to the trade.

I, of course, assume that the society will deal with those unfixed varieties already in commerce. At the present time the list of too-much-alike varieties is of little help to anyone, but with the detailed report on fixed stocks it would enable us to know which varieties are identical, and what differences there may be between others.

There is a marked difference in the colour of sweet peas growing in a row as compared with the same variety when bunched, and to arrive at a more accurate description of its colours, I make a further suggestion, namely, that a bunch of twelve sprays from every fixed stock (new and old) be brought from the trials to the London Show, and staged under numbers, in their different colour sections, and judged by points for colour effect and size. A few ladies would be useful as judges in this class. After the judging each bunch shall be named or numbered as sent to the trials. Should this proposal be adopted, I venture to say it would be the great attraction of the show, and a real benefit to hundreds of members who cannot visit the trials. It may be urged that there is already too much to do on the morning of the show, and someone may argue that space is limited. But is the work of the society at this show to cater for the exhibition only? I contend that it is equally important the society should give its members and the general public the opportunity of seeing the cream of the varieties grown at the trials. I feel sure all difficulties can be overcome, and this attractive feature would give an added stimulus to the whole work of the society.

NEW PLANTS, ETC.

DENDROBIUM PHALÆNOPSIS SCHRODERIANUM ALBUM, SANDER'S VAR.

A lovely flower, with an unwieldy name. It is the largest, best formed, and purest white form of this beautiful dendrobium yet seen. F.C.C., R.H.S., December 21, 1909. Messrs. Sander and Sons, St. Albans.

ZYGO-COLAX CHARLESWORTHI RUBIDA.

A charming little plant obtained by crossing Zygopetalum Perrenondi with Colax jugosus. This variety has creamy sepals and petals, freely marked with deep purple, and a prominent lip of bright red-purple hue. F.C.C., R.H.S., December 21, 1909. Messrs. Charlesworth and Co., Haywards Heath.

CYPRIPEDIUM MRS. F. SANDER.

This fine cypripedium is the result of crossing C. Eve with C. insigne Sanderæ. The broad dorsal sepal is white with a pale green base, and the waved petals and open lip are light greenish yellow. F.C.C., R.H.S., December 21, 1909. Messrs. Sander and Sons, St. Albans.

LÆLIO-CATTLEYA FIRMINI.

A wondrously beautiful hybrid, with broad yellow sepals and petals, richly suffused with rose, and a golden lip, finely coloured with crimson at the apex, and margined with rose. The parents are L.-c. Ceres and C. Dowiana aurea. F.C.C., R.H.S., December 21. Mons. Firmin, Lambeau, Brussels.

CYPRIPEDIUM ALABASTER MAGNIFICUM.

A very bold and attractive variety with a broad dorsal sepal, white, with a green base and purple lines. The petals and lip are greenish yellow, flushed with dull purple. The parents are C. Godseffianum and C. Alcibiades superbum. A.M., R.H.S., December 21, 1909. Lieut.-Colonel Holford (orchid grower Mr. H. Alexander), Westonbirt, Gloucester.

ONCIDIUM HYBRIDUM.

A very interesting but not particularly attractive orchid. It is the first hybrid oncidium raised artificially, and the parents are O. tigrinum and O. lamelligerum. Certificate of Appreciation, R.H.S., December 21, 1909. Messrs. Charlesworth and Co., Haywards Heath.

LAURELIA SERRATA.

This is the Huanhuan tree of Chili. It has broad thick leaves with boldly serrated margins, and produces curious greenish yellow flowers in short axillary cymes. A specimen in the gardens at Kilmacurragh, Wicklow, obtained from the Messrs. Rollison, of Tooting, about 1868, is now 33ft. high. Bot. Mag., t. 8279.

RHODODENDRON COOMBENSIS.

A Chinese plant collected by Mr. E. H. Wilson. It is of dwarf, shrubby habit, with small, leathery, sparsely set leaves, and pale purple flowers, each about 1½ inches across, borne in trusses. It appears to be a very free-flowering rhododendron, but as yet there is some doubt as to its being a distinct species. Bot. Mag., t. 8281.

Kew Gardens on Boxing Day.—On Monday last there were over 7,000 visitors to the Royal Botanic Gardens, Kew, an increase of 3,000 over the number recorded on the Boxing Day of 1908.

ALYSSUM SPINOSUM.

One of the alpines which, in a small state, have little appearance is the Spiny Madwort, Alyssum spinosum, a native of South Europe, but, so far as general experience goes, it is, like many other plants from the south, perfectly hardy. I have cultivated it for a long series of years, and have only lost it from other causes than winter's cold. It may be lost from neglect of top-dressing the plant when the soil becomes washed away from its roots, or when it has grown too much above the surface of the earth. Very old plants thus neglected may succumb, but if carefully attended to at least once a year, and a little fresh soil added to the surface, they will go on for many years, and will give continued pleasure.

Of somewhat trailing nature, Alyssum spinosum is not entirely recumbent, and forms a pretty bush of a shrubby nature, covered with small silvery-grey leaves, and reaching sometimes as much as a foot in height. A plant of some size looks always pleasing, and when covered in summer with its small white flowers, resembling those of A. maritimum, but rather less in size, is not a plant to be despised by any means. A feature of this alyssum not commonly observed is that which gives it the specific name of spinosum, this being the production of small sharp spines on the hard portions of the stems. In a small plant these are not common, but on a larger one they can be found in plenty.

The spiny alyssum requires comparatively little care in its cultivation, but I may remark that I have found it thrive best well up on the rockwork, and in a compost of sandy loam, grit, and stones. In such a soil a little leaf-mould is hardly necessary, but some add it to the compost. I prefer to grow it in a place where it can receive a good deal of sun, and in which it is not too much exposed to rain, although it does not suffer much from this if high up on a well-drained part of the rockwork. A good plant in my garden, with the bush half trailing over the rock, looks pleasing for many months in the year. There is a pale pink variety which is not plentiful.

S. ARNOTT.

WIRE ENCLOSURES FOR FRUIT TREES.

In a district where birds are abundant and troublesome it is often excellent economy to enclose the whole of the small fruit quarters with wire netting, so as to exclude the feathered hordes that would otherwise devour a great part of the crops unless someone was kept on duty scaring them away.

The fruit enclosure at Nuneham Park here illustrated, was built by Messrs. Boulton and Paul, of Norwich, three years ago. It is 187 feet long, and 50 feet wide. From ground level to ridge it is 16 feet 6 inches high, and 6 feet 6 inches from ground level to eaves. It was built in this way so as to throw off snow. The structure runs east and west, and all the supports are of 1¾ inch angle iron. The galvanised wire netting is of five-eighths inch mesh. Espalier trellises are placed 5 feet apart, the wires being fitted with screw bolts at each end to allow for tightening. Half these espalier wires support raspberries and loganberries, the other half being devoted to gooseberries.

Against each of the tall supports in the middle of the enclosure a tall standard sweet cherry is planted, the branches being trained fan-shape along the top wires.

There are three gates on one side of the enclosure, and a four-foot passage runs north and south through the plantation, dividing it in half, and another runs along each side, these passages allowing the necessary room for wheeling, cleaning, etc.

PROPAGATION OF CHRYSANTHEMUMS.

Chrysanthemums have been so much written about during recent years that it is difficult to say anything that is fresh, from a cultural point of view. All one can do is to repeat for the benefit of the vast body of new growers the details essential to success. At the same time, such advice may serve as a reminder to others that the time has arrived for the rooting of cuttings, and sundry other essential details. All the encouragement possible should be given to beginners, because the older growers are gradually being reduced in number, each year seeing the retirement of one or more prominent from exhibitions. It is already a common question at shows, "Is the interest in large chrysanthemums declining?" From the large number of entries received by many societies during the season just past the conclusion is that it is not. However, be that as it may, all encouragement should be given to beginners.

Directly the flowers are cut from the plants a commencement should at once be made for next season's display. Cut the stems down to within a few inches of the soil, and stand the pots where the plants will obtain light and air, to induce the suckers, as they push from the base, to make a short-jointed growth. Some varieties throw up suckers so freely that they become weakened by overcrowding; when this is likely to occur before the cuttings are required, thin out the weakly to give space for the stronger. Some varieties are shy in producing cuttings, and it will be advisable to place the plants where they will have gentle warmth. Occasionally syringe the stems to encourage growth, but do not give too much water at the roots, as that would increase the stagnation already there.

Opinions differ as to the best time for rooting cuttings; some growers prefer one time, and some another. Taking the chrysanthemum broadly, as a hardy plant, it is natural to assume that a long season of slow, uninterrupted growth is an advantage for the production of large, high-class blooms. That is, blooms that are of a depth and solidity proportionate to their diameter, not merely of great width, and so thin that when staged the board can be seen through florets when looking down upon them.

If a bloom of Lady Talbot, for example, is nine inches in diameter it should not be less than seven inches in depth, or one of the Hon. Mrs. Lopes, an inch wider, should measure at least eight inches in depth. The florets should be broad for the variety, stout, and of good colour.

In the case of incurved blooms these requirements are even more essential, because, what is an incurved specimen of any variety when shallow, and without "build," substance of petal, and solidity? Some growers advise the striking of cuttings in bottom heat in February and March, but plants so raised are not so good as those raised earlier, for the reason that time will not allow of their proper development during the various stages of growth. The wood of late-struck plants does not ripen thoroughly, and in this way the blooms usually lack solidity. There are, naturally, exceptions to every rule. For instance, some of the finest blooms seen this season of Mrs. L. Thom were produced by plants raised from cuttings struck quite late in the season. Another objection to late propagation is the space required to keep the old plants for the production of cuttings for two months longer than would otherwise be necessary. In a general way the plants grown for large blooms should be raised from cuttings rooted between the middle of December and the same period of January. For ordinary decorative bush plants and single-flowered varieties, it will be early enough if propagation is commenced in February.

There are many ways of striking the cuttings. Cold frames, cool houses, in handlights, and the shelf of a greenhouse may all be utilised in chrysanthemum propagation. The point to enforce is that once the cuttings are inserted there should be no check afterwards, but a slow, regular, uninterrupted growth maintained until the blooms are developed.

In a cold frame the cuttings will root as well as elsewhere; the only objection to this method is that of frost, which may prevent progress for a month or six weeks, and while frost will not injure the cuttings, they are not growing, therefore they are losing time.

The best of all methods is that of inserting one cutting in a pot $2\frac{1}{2}$ inches in diameter, and placing the cuttings under a handlight in a cool house having a temperature of from 40 degrees to 50 degrees, or in other words, where the frost is excluded. Any sweet, light, sandy soil will be suitable for the cuttings, which should be about three inches long, where possible; insert them firmly in the soil, giving a gentle watering to settle the sand and soil about the cutting. Stand the pots on sifted coal ashes in the frames or handlights, for securing a cool moist foundation and excluding air. The light should be kept closed until roots are formed, with the exception that they may be taken off for an hour in the morning for the dissipation of excessive moisture, and in the evening the glass should be wiped dry. This in the dull days so often experienced at this time of the year prevents damping.

In about a month some of the cuttings will be rooted, the strongest growing varieties being the first to emit roots.

E. Molyneux.

BARR'S HYBRID LUPINS.
These are of L. polyphyllus character, and in various colours.

LUPINS.

An old legend of the lupin tells us that the rattling of its seeds in the pods almost revealed to the soldiers in pursuit of the Virgin and Child in their flight to Egypt the hiding-place of the fugitives in a brief halt they made, and that, in consequence, the plant received the maledictions of the Virgin. Some of the species have, however, been supposed to have medicinal virtues, and the seeds have also been used as food. One could devote considerable space to the legends and supposed virtues of the plant, but its horticultural aspect is that which calls for our notice at present, and the others must be left out of account any further.

As a plant for the garden, the lupin in its several forms commands our admiration, its effect being good, while the ease with which most of the species and their varieties can be cultivated renders it a satisfactory and most valued flower. The annual varieties have been and are most popular, but the operations of seedling raisers among such species as L. polyphyllus and L. arboreus have given the perennials a renewed popularity. At one time the former was but little seen save in some old gardens or in that of the country cottage, but it was not to be expected that a plant of its presence should be long neglected, and it has come once more into favour; its shrubby companion, L. arboreus, being also much sought after.

Lupinus polyphyllus.

For the herbaceous garden the species which is of most value is Lupinus polyphyllus. This, the many-leaved lupin, is a handsome plant, with pleasing foliage and long spikes of flowers, producing a bold effect when the plants are in large groups or standing well apart from other tall flowers in the borders. They grow from four to six feet or so in height, and require a good soil to do them justice. The lupin is a voracious feeder; hence, indeed, its name, coming, it is said, from lupus, a wolf, signifying its voracious character. A deep soil, well manured, will result in finer spikes and more effective flowers.

The original form of L. polyphyllus is said to be purple. There is a desirable white variety, but some of the forms of this are specially liable to drop some of their flowers at intervals along the spike, thus reducing its beauty. Then there is a handsome blue and white variety, called bicolor. Within the last few years a break has occurred in the prevailing shades, and a handsome rose-coloured variety called Moerheimi, is one of the best of this shade. Roseus is another good rose form, looser in its spike than Moerheimi, but equally beautiful in the eyes of some. But the shades of colour now are varied in the extreme, and from a packet of mixed seeds of a good strain, such as that of Messrs. Barr and Son, one of which is here illustrated, many varieties can be secured. Some of the named varieties exhibited by this and other firms at the Temple Shows are exceedingly handsome. For the border or the wild garden such lupins are of inestimable value, and for the latter L. p. grandifolius is a bold subject.

Lupinus arboreus.

The next in point of importance is L. arboreus, the tree lupin, which, when it has attained some size, is one of the most ornamental plants we have. It is of shrubby habit, and forms great bushes several feet high and through, laden with neat leaves and covered in summer with candelabra-like spikes of flowers of various colours. The range of colours has been greatly extended, and we have the tree lupin in shades of lilac, blue, purple, white, yellow, and intermediate tints. Snow Queen, here illustrated, is a very handsome white variety, but there is scarcely a poor plant to be found among all the varieties.

The tree lupin, beautiful as it is, has the drawback of being liable to die off without apparent cause, a large specimen often succumbing in winter, although others may survive in the same position. It is easily propagated, however, either by seeds or by cuttings, the latter being the method for named varieties, now rather numerous. Cuttings may be taken either with or without a "heel," and struck under a bell-glass or a handlight in the open ground. Seeds can be sown in spring in the open or under glass.

Lupinus nootkatensis.

Next, possibly, in importance of the perennials is the pretty little Lupinus nootkatensis, from the Nootka Sound, and growing little more than a foot or two in height, and sometimes less than that. It has pretty spikes of blue and white flowers, and is a useful border plant for the front or second row. It grows readily in any soil, and is increased by seeds or division.

Lupinus argenteus.

One of the few other perennial lupins in the market is L. argenteus, a pretty species with purple flowers and pleasing silvery foliage. It is about 3ft. high, but is not too hardy, especially in districts where there is much rain in winter, followed by severe frosts. It is increased by division or by seeds.

Lupinus Somerset.

Understood to be a hybrid between L. polyphyllus and L. arboreus, L. Somerset is a pretty yellow-flowered herbaceous lupin of some beauty. Occasionally plants bought as Somerset assume the tree form, and one suspects that these have been seedlings and not plants raised by division or cuttings.

Annual Lupins.

The annual lupins constitute a valuable class of plants, and one acquiring almost annually a greater range of colours. Their nomenclature is somewhat puzzling, and it is well for garden purposes to follow that under which the seeds can generally be obtained. L. Hartwegi, blue and white, 2½ft. high, is excellent; and of the same stature we have several hybrids, known as L. hybridus, with the varietal names of L. albo-coccineus, L. roseus, and L. superbus, respectively rose and white, pink, and yellow and white. L. luteus, pale yellow, is 2½ft. high, and the tall L. mutabilis, about 4ft., is pleasing with its pale purple and yellow flowers; the variety L. roseus splendens being more showy with its rose flowers. L. nanus, blue and white, is a good bedder, about a foot high. L. pilosus, 3ft., blue, and L. p. albus, white, are good plants; and in L. sub-carnosus, violet blue, with white centre, and a foot high, we have one of the best of the annual varieties. Sutton's Carmine and White is a very beautiful bedder, with its carmine, white-tipped flowers.

These annual lupins are most beautiful, and as the seeds are cheap they can be largely planted to make a good display. Their cultivation is simple, as practically any soil will grow the lupin, although they are finer and last longer in bloom in a fertile one. The seeds should be sown in April in the open, where they are to bloom, and ought to be well thinned out, so as to give the best results. These effective and beautiful flowers are of the greatest service to the gardener in arranging his summer display. S. Arnott.

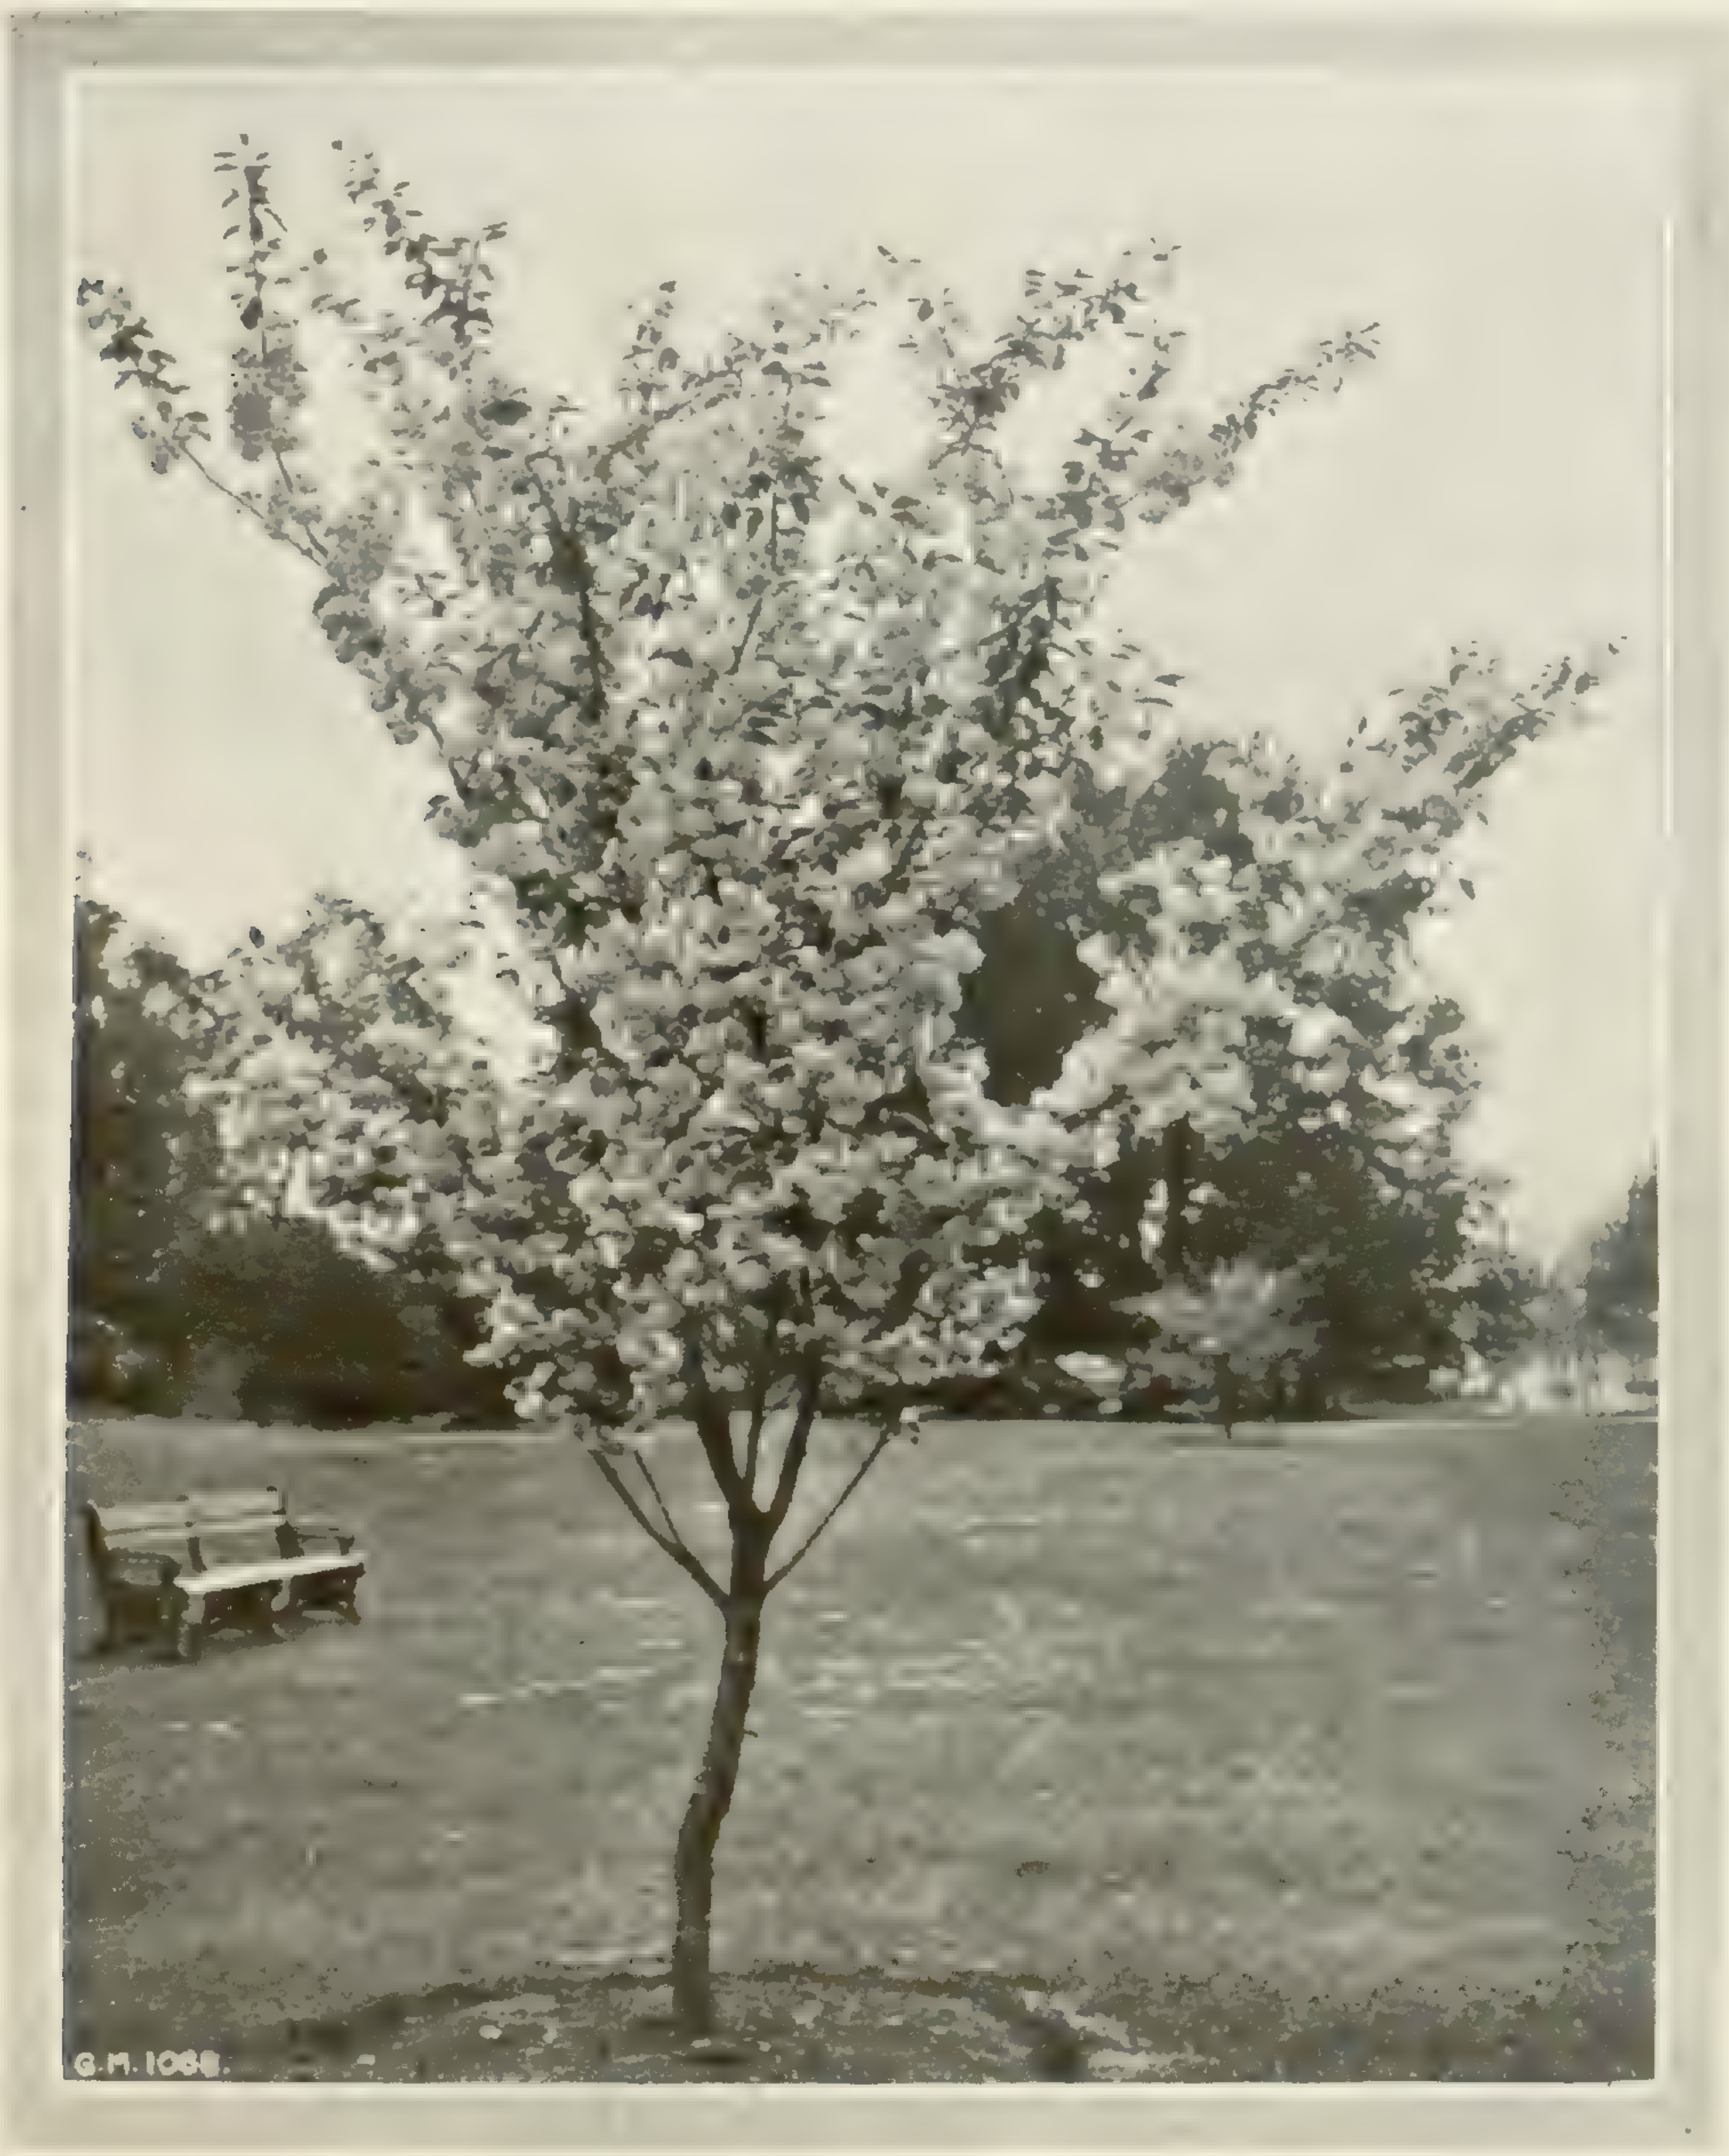
LUPINUS ARBOREUS SNOW QUEEN.
Flowers white.

HOTBEDS.

Well-prepared hotbeds will now be in great request, as gentle forcing is best for carrots, asparagus, lettuce, turnips, etc. The materials should consist of two parts leaves to one part of long stable manure, which must be well mixed, turning them several times to sweeten before finally building the bed. The beds should be four feet high, and two to three feet wider than the frames placed thereon. In a few days prepared light soil must be placed in the frames to a depth according to requirements. When nicely warmed and settled down, a good type of forcing carrot should be sown in lines ten inches apart, and between these radishes and lettuce could be sown. Subsequently more beds should be made, according to the demand, where the earlier sown lettuce should be transplanted. These beds could be made with leaves, grass, etc. It is remarkable what a small amount of stable litter will be required to keep up a steady heat for such things. G. Ellwood.

ORNAMENTAL CHERRIES.

Whether growing in hedgerow or coppice, in garden or orchard, or in pleasure-ground or park, a cherry tree when its branches are enwreathed with flowers, so exceedingly beautiful as to at once command the attention and compel the admiration of those who appreciate the charms of the forms of arborescent vegetation that have their home within the British Isles. There are differences of degree in the beauty of cherries as in the case of most other trees. The beauty of a wild gean that has become established in the hedgerow is very different to that of a tree of one of the varieties grown for fruit production in the orchard or garden, and the charm of the latter falls considerably short of the finest of the double-flowered varieties that now have a place in the garden. It may indeed be said that the best of the ornamental cherries have no superior among hardy trees flowering in spring, and that as a consequence thereof, they should be represented in all gardens of a size that will afford accommodation for one or more specimens. The ornamental cherries are indeed glorious trees, and as they are equally suitable for large and small gardens, it is surprising planters should have paid so little heed to them that, until their merits were brought prominently into notice in these pages, it was a rare occurrence to find anyone of them in private gardens. Happily, they have within recent years been planted more largely, but they are not so freely used in the creation of garden scenery as could be desired. The attention of my readers might well be directed to the illustration of the double form of Prunus Avium, as they will see at a glance that the tree is elegant in aspect and immensely attractive when bearing its precious burden of snow-white flowers. The tree illustrated is quite young, and not more than fifteen feet high, but it will, under fairly favourable conditions, attain to quite double that height. Not less deserving of attention is the illustration of the tree of the fine variety of P. pseudo-cerasus known as J. H. Veitch. It will be seen how great is its powers of flower production, and when it is stated that the blossoms are of a rich rose-pink hue, no great stretch of the imagination will be required to appreciate its wondrous beauty.



PRUNUS PSEUDO-CERASUS J. H. VEITCH.
A young tree of this fine cherry; the flowers are large, and of a soft yet bright pink hue.

The ornamental cherries have, in addition to a graceful habit and attractive flowers, the merit of rich leaf tints in autumn.

In the selection of positions for the ornamental cherries it should be remembered that the European forms, such as P. Avium and P. Cerasus and their varieties are the most suitable for lawn specimens and avenues, and that the varieties of P. pseudo-cerasus appear to the greatest advantage when arranged in small groups on the lawn or singly among shrubs of comparatively low growth. It will also be an advantage if a position for both the Asiatic and European cherries can be selected where they will receive some shelter from east winds, which sometimes do considerable damage to the flowers and thereby shorten the period of the attractiveness of the trees. It follows as a matter of course that in planting these cherries the same care should be taken as is considered necessary in dealing with those grown for their fruit. Careful planting and secure staking are essential, and it is a good practice to shorten the young growths to about one-half their length within a few weeks of the trees having been planted. Subsequently but little, if any, pruning will be required.

The following will form the best possible selection, and before proceeding to enumerate them it may be useful to mention that, owing to the confusion which exists in their nomenclature, they may not all be met with in trade catalogues under the names given. The names are those of the Kew "Handlist of Trees and Shrubs," and it would be an advantage were those engaged in their cultivation for commercial purposes to adopt the Kew nomenclature.

Prunus Avium flore-pleno is the finest of the European cherries, and should certainly be one of the first to be selected. It forms a handsome round-headed tree, attaining a height of about thirty feet, and bearing a profusion of large, pure white pendant double flowers. So freely are the flowers produced that the branches are simply wreaths of blossom, as indicated in the illustration herewith. This cherry blooms at the end of April or the beginning of May, and seldom fails to bloom in the most profuse manner.

P. Cerasus Rhexi flore-pleno.—A handsome variety, bearing a profusion of medium-sized pure white flowers, which are very double. This does not equal in merit the double form of P. Avium, and the latter should have the preference in making a selection for a garden in which the space is limited.

P. pendula is a remarkably beautiful cherry, graceful in growth and profuse in flowering. The flowers are of medium size, and a rich rose colour, and usually attain their full development during the second week of May. It is very generally known as C. pendula rosea, and is a great favourite with the Japanese, who plant it freely in the vicinity of their temples.

C. pseudo-cerasus and its varieties form a small but valuable group for garden decoration. The single variety is very beautiful, but it is not equal to the double forms, which alone should be planted in gardens other than those of the largest size. The typical double form, which is known under the name given at the commencement of this paragraph, is a comparatively low growing and shapely tree, and remarkable for its abundant flower production. The flowers are of large size ranging from one and a-half to two inches in diameter, double, and of a pleasing light pink colour. The variety known as Watereri has pale rose-coloured flowers, and is rather later in blooming than the type. Still later by a week or ten days is J. H. Veitch, which has large rose-pink flowers, and is unquestionably the very finest of the forms. The habit, freedom of blooming, and the relatively large size of the flowers is well shown in the accompanying illustration of a tree growing in the Royal Gardens, Kew. This valuable tree was brought from Japan by the late Mr. J. H. Veitch, and was distributed about ten years since.

P. serrulata is closely related to P. pseudo-cerasus, but is distinguished from it by its horizontal habit of growth, its glabrous leaves, and the shape of the flowers. As in the case of the allied species the blossoms are double and freely produced; but they differ in being white tinged with pink, and produced ten days or a fortnight later. Highly effective when in bloom, the tree is especially deserving of attention for its distinct habit of growth and the aid it is able to give the planter in the production of distinct effects. It should be utilised in the formation of Japanese gardens, but its suitability for that purpose has been overlooked.

GEORGE GORDON.

THE GENEVA HORTICULTURAL SCHOOL.

Among the many excellent educational establishments of Geneva the Ecole Cantonale d'Horticulture holds a not unimportant place, and a few notes on a visit to the school, and on the work which is being done by the masters and pupils, may be of interest.

It is situated at Chatelaine, just outside the town of Geneva, and the land, which lies between two roads, comprises seven hectares, or 70,000 square metres, much of it being laid out as an ordinary nursery, with flowers, trees, shrubs, and also fruit and vegetables.

The school was established twenty years ago, and Mons. Platel is director; he is much interested in special flower culture, particularly orchids, of which we saw a good show in September in two of the houses. M. Platel is fortunate in having the help of Dr. Lendner, of the University, as a teacher of botany, and among the other subjects in which instruction is given by separate teachers are market gardening, tree culture, agricultural chemistry, French, bookkeeping, elementary surveying, and landscape gardening.

The students have recently had to make large-scale plans of the laying out of a proposed house and grounds on a field adjoining the school premises, the design comprising an orchard, tennis court, roads, shrubberies, etc. Landscape gardening seems to be much in evidence in Switzerland at present.

Among the students this year are two Germans, two Spaniards, one Italian, and one English. Foreigners pay the moderate amount of 850 francs (£34) per annum for board and lodging and instruction, the latter consisting of three parts practise and one part lectures. Instruction is given free to lads of Canton de Genève, and other Swiss pay 250 francs a year. The full course is one of three years, during which time no salary is received. The year is divided into two terms. The pupils generally get three weeks' holiday in the year, and their hours are long, viz., in summer from 6 a.m. to 6.45 p.m., with half an hour for breakfast, quarter of an hour at 10 a.m., two hours for dinner, and twenty minutes for tea. On Saturdays they finish at 3.45, and Sunday work is so arranged that each student is only on duty about once a term.

Switzerland has not yet shown Germany and other Continental countries, as England can well do, that the same, or even more, work can be done in a shorter day, and especially if the universally long time for midday dinner is considerably curtailed. On going from England to Switzerland one is often annoyed to find that banks, and even some post offices, are generally closed from twelve till two p.m.

An excellent monthly horticultural paper is edited and published at the school. It is called the "Journal d'Horticulture et de Viticulture Suisse." It is an illustrated quarto, published at four francs per annum. Among the more important articles this year have been one by Dr. Alf. Lendner, entitled "A Dangerous Enemy of Rose Trees" (Peronospora sparsa); "The Use of Chemical Manures in the Culture of Vegetables," by Professor Monnier, and on a new method of cultivating asparagus by a French grower.

There is a very fair museum at the school, comprising polished sections of various timber trees, cases of sand-dried specimens illustrative of inflorescences, the classification of fruits, the dispersal of seeds, etc., also models of edible and poisonous fungi, cases of injurious insects, and the mischief they do. Some of these were shown in the scientific department of the Geneva International Horticultural Exhibition this autumn. At this show we also noticed two large cards with mounted specimens of pressed alpine plants, showing in a very practical manner certain characteristic lime-loving species and their corresponding allies, found chiefly on the older siliceous and granite rocks. One card was headed "Plantes calicicoles," and the other "Plantes silicicoles."

Although the more we study the question the more we are inclined to agree with Professor Warming, in his excellent book on the "Ecology of Plants," recently translated into English, that the physical have more influence over vegetation than the chemical properties of the soil, yet we think children in some of our schools might be encouraged to take Geneva as a model and make similar small, comparative collections of, say, (1) characteristic plants from a chalk or limestone down, and those of an old red sandstone moor, or (2) plants from a sandy heath or common, and those of the sand dunes of the coast; (3) species growing in a salt marsh, and those in an ordinary inland marsh, or (4) those from a bog on the mountain side, and others from a peat moor or turbary. Such a collection should greatly tend to develop a child's faculties of observation and reasoning.

H. Stuart Thompson.

PRUNUS AVIUM FL. PL.
A medium-sized specimen of this handsome cherry. The flowers are large in size and snow-white.

Tomatoes.—Those sown in October will now be ready for shifting into 5-inch pots; place them on shelves near the glass in a temperature from 55 deg. to 60 deg.; maintain a buoyant atmosphere, and be very sparing with water.—G. E.

FORCING ROSES.

Few subjects are more taking than a well grown pot rose, nor are any flowers more popular than roses when cut from under glass early in the year. To grow a pot rose suitable for the conservatory needs different treatment from the first, compared to growing a number of good blooms solely for cutting purposes. The fine specimens seen from time to time at the Temple and other exhibitions have received a long course of careful attention. In many cases, even these would not have the most taking appearance if set out separately; it is the artistic grouping that causes such superb effects.

Many roses that are extra useful to cut from do not make good or shapely plants. One of the main causes of failure is crowding, and an over-mixture of subjects in the forcing house. Too hasty commencement is another frequent fault. We do not bear in mind sufficiently how steadily roses come on at first in a more natural condition. It is after the groundwork is laid that they can be hurried on a little. Note how very rapidly roses come on during a few days' genial weather early in June, when they have been growing steadily for six weeks or so. It is the same in forcing. Start early and proceed steadily. To do this with the greatest chances of success we need well-ripened wood, not a large quantity of it, but firm and not coarse. You must have a healthy plant to succeed in obtaining any but very mediocre results.

Having obtained a good foundation to commence upon, see to the drainage, repot, and mulch where necessary, and prune carefully. One must consider, too, whether really good specimens or merely a quantity of fairly good flowers are wanted when pruning. A temperature of 50 degrees is ample to start with, and I do not care to have the soil very wet about the roots. A few uses of the syringe, with a little warm water, helps the buds to push, and root moisture can be applied more freely as growth proceeds. After the buds burst and the growths are about two inches in length the temperature may rise from 10 to 15 degrees with advantage, but I would not do so earlier. My experience is that hasty forcing often causes many blind or flowerless growths. Not that the embryo bud was not there, but it could not develop, and, even if it did, in many cases, a slight check, owing to the roots not being sufficiently active to supply enough nourishment, they fail, and drop off while almost invisible. Another frequent cause of quite young buds failing no doubt proceeds from injudicious use of insecticides or too strong a fumigation. I have noticed this last more particularly with Niphetos—still our best forcing white rose. In fact, just at this stage any check, even from slight drought, may have a very bad effect.

To keep plants of roses healthy is undoubtedly half the battle against insect enemies, while mildew should not be much trouble where a house is devoted to roses. One can generally trace the cause of this dread disease to extremes of one kind or another. It may be from extremes in temperature, watering, or from too strong an application of liquid foods. Check of some kind is always the forerunner of mildew, and keen draughts when ventilating are probably the most general. Roses do not need so much ventilation as many give; in fact, only just sufficient to aid in regulating the temperature. I would much rather check the fire heat and throw down plenty of water upon the few sunny hours than admit any outside air.

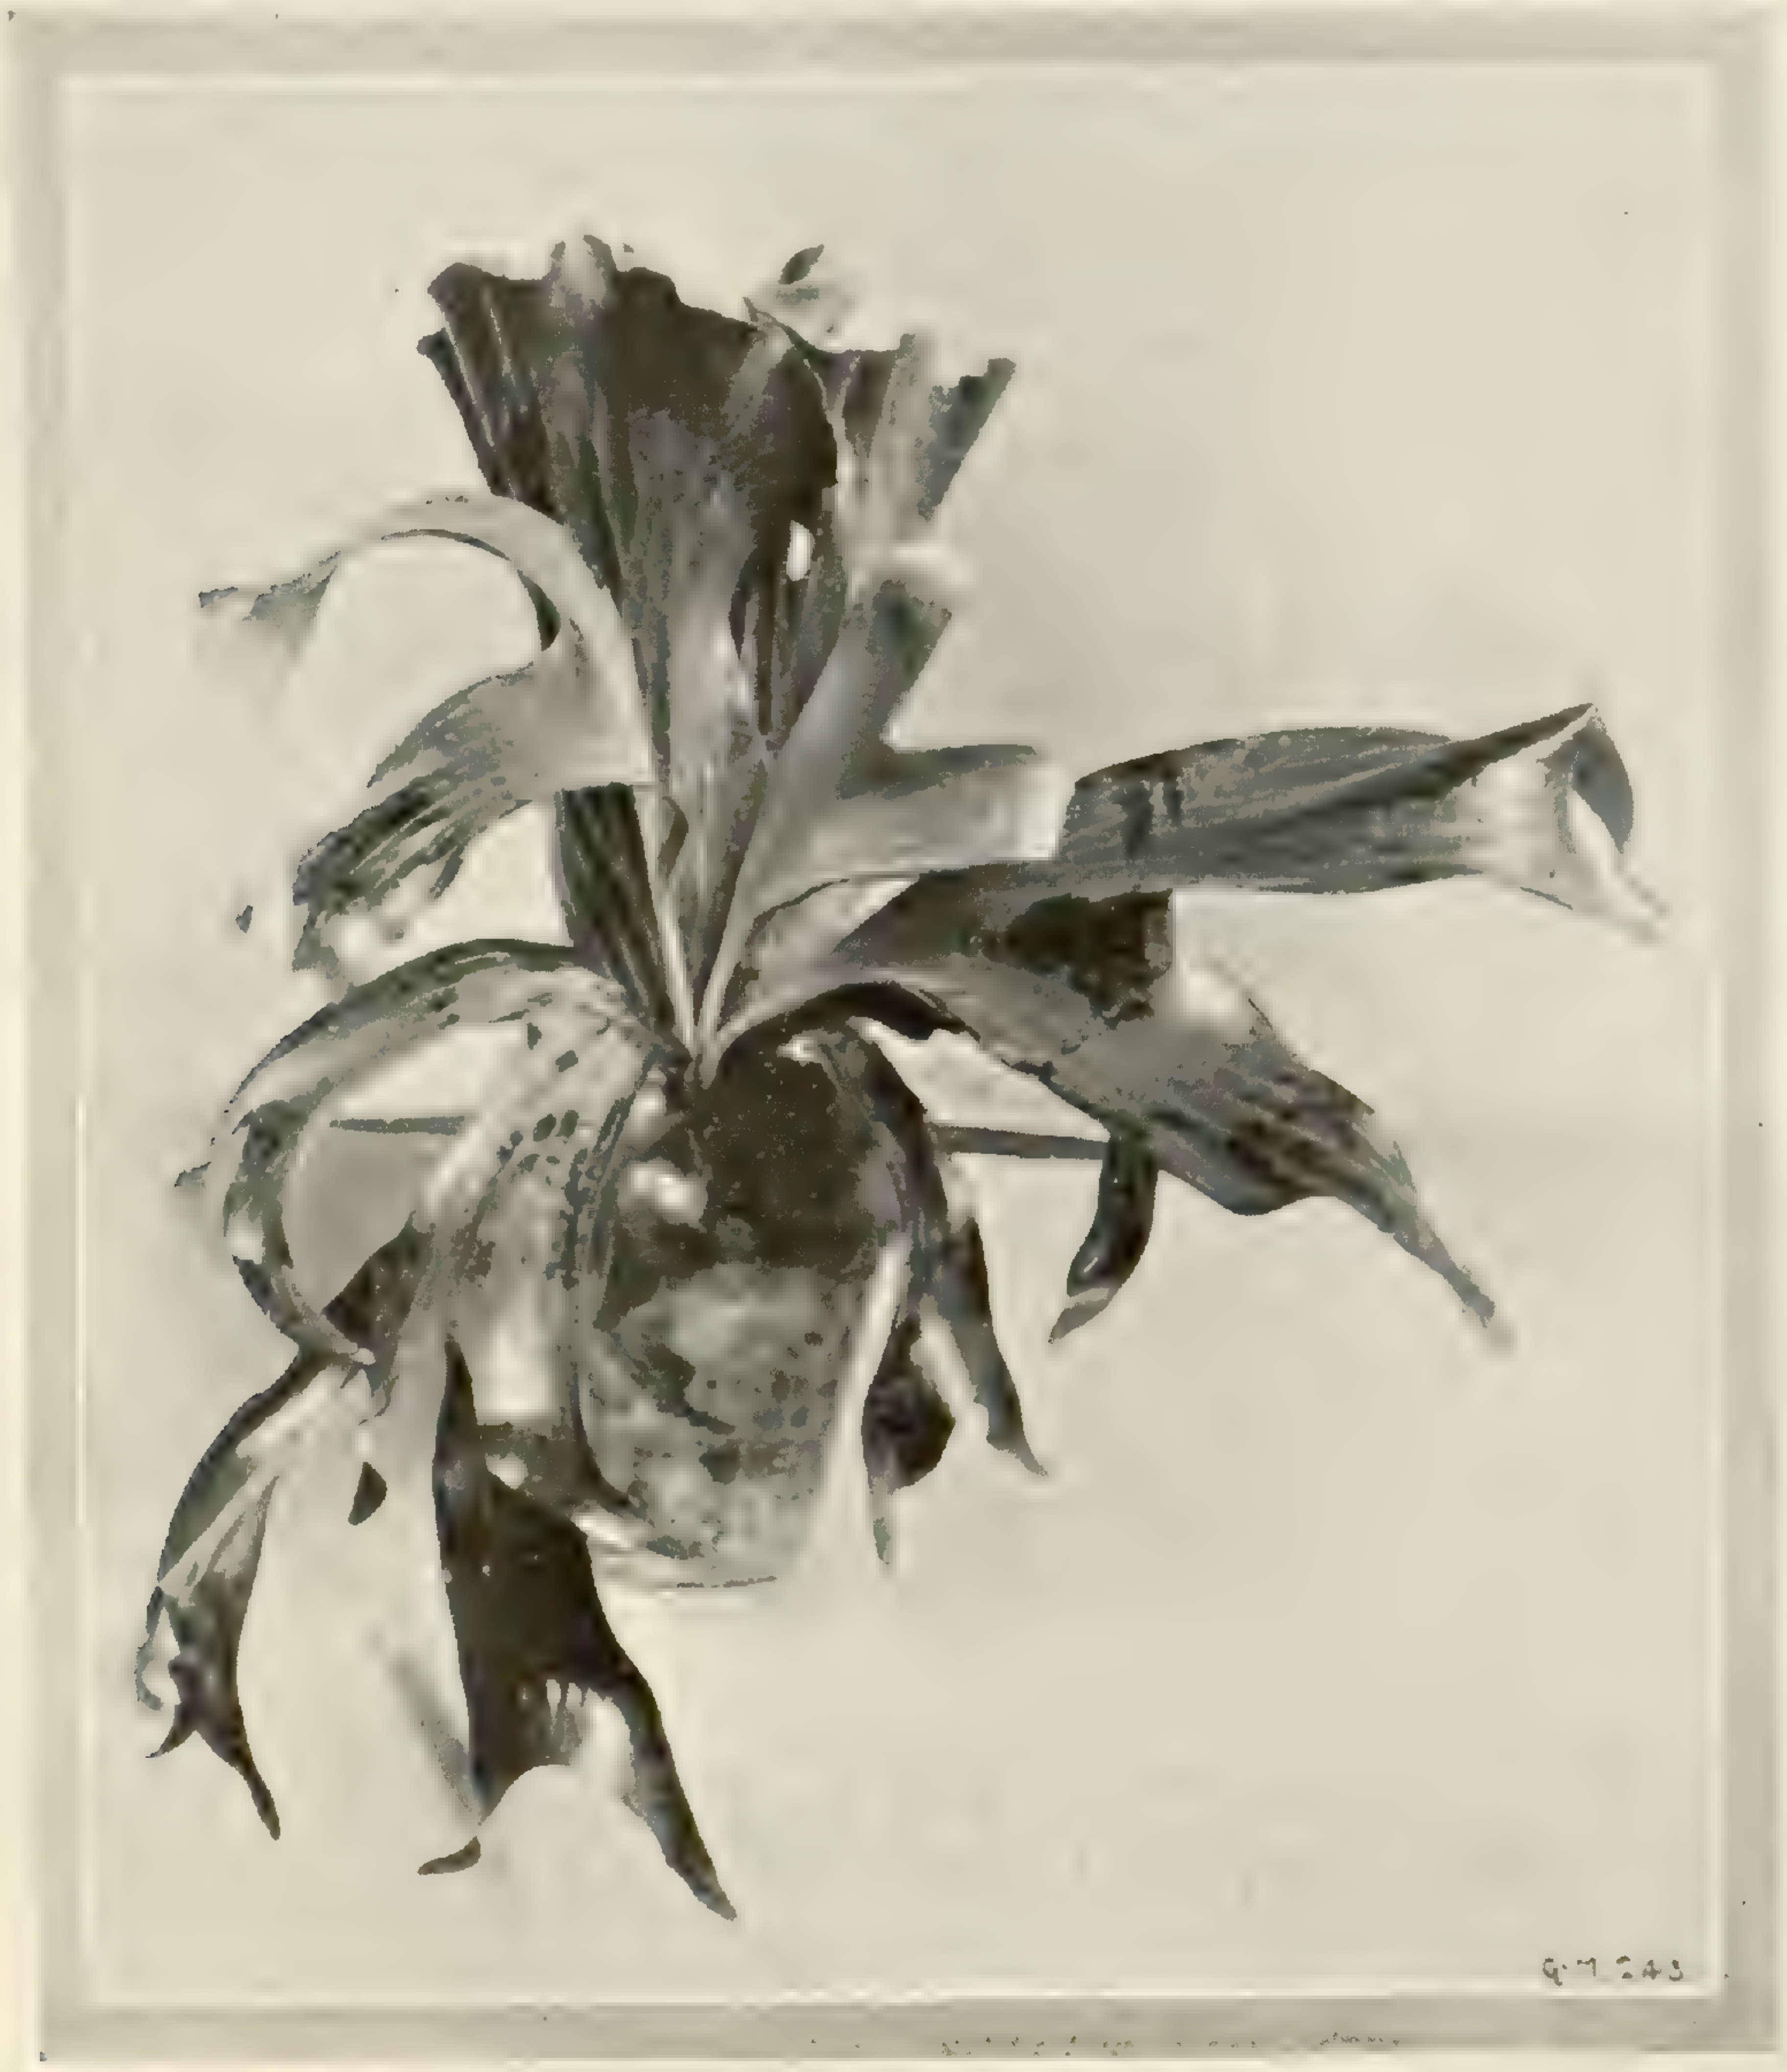
Steadiness has been advised as regards heat, but it is also needed when applying liquid stimulants, and in fumigating or syringing when fighting against insects. Give liquid manure freely when growth is well established, but let it be weak. If used strong, the delicate feeding roots are checked at their points of growth, and one can frequently discover this if a plant is turned out of its pot after an overdose of liquid food.

Attack insects immediately they appear. Do not wait a day or two because you only discover a few, as they increase so rapidly. Syringing and fumigation are both capital things when used with judgment. I prefer to fumigate slightly at night, and then syringe the following morning. The latter knocks off and settles those not quite killed by the fumigation. But whatever you apply against these pests, avoid extremes. Mildew can be best battled against by adding flowers of sulphur to the water used in syringing. Keep it well stirred during use. As the foliage dries there will be a fine and not unsightly dusting of sulphur left, quite sufficient for its purpose.

As the sun gains in power a little shading will be needed, not so much against the sun's rays, as to help in regulating the temperature without much ventilation. During February and March sun and wind are often very trying, and we must avoid draughts. Roses in pots like a cool surface to rest upon, and I prefer them to be anywhere rather than upon wooden stages or benches. Tiles are excellent, for they last well, and can be cleaned easily when necessary, and do not rot when extra moisture is thrown among the pots.

Of late there has been several newer roses from the dwarf Polyantha section that are more than usually suited for pot culture. Mrs. W. H. Cutbush, Phyllis, Jessie, Baby Dorothy, and Madame Norbert Levavasseur are really grand for this purpose. All of these are exceptionally free in blooming, and last a long time, making perfect little specimens that cannot fail to please.

Uckfield. A. PIPER.



PLATYCERIUM ÆTHIOPICUM.

PLATYCERIUM ÆTHIOPICUM

The Elk's Horn or Stag's Horn ferns are few in number, the genus consisting of few species. These species, however, come from widely distant places. The best known and most commonly grown species, Platycerium alcicorne, comes from Temperate Australia, its larger form coming from Polynesia. P. biforme is found in the East Indies, and the splendid P. grande in Northern or Tropical Australia. P. Hilli, found in Queensland, is allied to P. alcicorne, and now regarded as a varietal form of the latter. P. Wallichi is found in the Malay Peninsula, and P. Willincki in Java. P. Veitchi is of garden origin, and P. madagascariense hails from Madagascar. P. angulense, formerly regarded as a variety of P. æthiopicum, now ranks as a species, but both come from Tropical Africa, and were originally found in Angola and on the Guinea coast.

P. æthiopicum is sometimes known as P. stemmaria, but the botanical authorities consider the latter name but a synonym. The fertile fronds of P. æthiopicum are broader and thicker than in P. alcicorne, and they are covered on the under surface with cottony down. The fruiting or spore-bearing portion of the frond is very effective, and the mass of sori is usually more or less V-shaped, and follows the forking of the frond. P. æthiopicum needs stove treatment, and will succeed side by side with P. grande. Our illustration represents a plant grown and exhibited by Messrs. H. B. May and Sons, Edmonton.

PHLOX BORDERS.

A choice selection of the finest late summer and autumn flowering phloxes of the decussata type will add much to the interest of a garden. Phloxes are showy, useful for cutting, and their perfume in the garden morning and evening is a distinctly pleasing feature. I do not think phloxes are grown nearly as much as their merits deserve, or at least they are not generally well cultivated in private gardens. There is a tendency to allow them to become overrun by stronger-growing subjects until they are weakened, and do not give a tithe of their natural beauty.

The accompanying picture, from a photograph by Miss Dendy Sadler, shows a remarkably fine border of these flowers, and well illustrates their usefulness under good treatment. An edging of violas at the front is also a good idea for hiding the stems of the phloxes, and the soil, and giving variety over a longer period than the phloxes will bloom.

[Photo: Miss Dendy Sadler.

A FINE BORDER OF PHLOXES.

A suitable site will favour success. A western aspect is good, as there the plants receive protection from the fierce morning sun, and during a spell of hot and dry weather in June this is helpful to a luxuriant growth, as phloxes cannot withstand drought without special attention in the matter of mulchings, and a free supply of water at the roots.

Some persons advise the replanting of phloxes every two years. I have not found this necessary for ordinary garden decoration. These same folks recommend not more than three stems; well, if the largest of panicles and individual blossoms are required, for exhibition or any other purpose, I have nothing to say against that method of culture. For ordinary garden use, however, in the herbaceous border, or specially in a mass by themselves, clumps carrying at least a dozen spikes can be had, and even more, for at least six years. In such cases the weak shoots should be removed every spring to provide space for the stronger ones, and an annual top-dressing of short manure must be worked in about the roots to assist growth.

Propagation is a simple matter, and the easiest way is to take pieces with roots attached from the clumps, choosing the strongest outside sucker-like growths. Stout cuttings taken off in April, inserted in sandy soil, in a cold frame, and kept shaded for a few days, will quickly make roots, and be most useful for filling spaces at the front of borders, and will give a good-sized spike in the autumn. In this way, too, a stock of plants is easily raised for planting a full border of phloxes.

As to arrangement, that is purely a matter of taste. I prefer the massing system of having at least three plants of one variety together. In this way each sort has an opportunity of displaying itself fully. The preparation of the site, no matter where, is a simple matter. Deeply trenched, heavily manured soil is necessary. If this be heavy in character, retentive of moisture, and naturally cold during the winter, then early in March is a good time to plant, preparing the soil in the autumn. Such soil favours slugs, and the plants have at times a difficulty to grow under such conditions. The addition of a small quantity of sandy soil, decayed leaves, or roadside grit, incorporated properly at planting time, will promote speedy growth. In the case of sandy soil, October is a good time to plant, as in such soil, which retains its warmth longer in the autumn, the plants start rooting at once, and consequently are in a better condition to grow away in the spring than are plants that are not bedded out until March.

Mulching the surface with half-decayed manure is helpful to phloxes. Decayed leaves, old potting soil, vegetable refuse, with some artificial manure added, is a good substitute for manure if this is objectionable. It is important the mulch should be applied early, say, at the end of April, to give the plants the full benefit of its use in enriching the surface soil and conserving moisture. Heavy waterings with liquid manure when the flower buds are forming is labour well spent, as it increases the size of the blooms and improves the colour of the leaves, all of which emphasise the colour of the blossoms.

As to varieties, there is an immense number to choose from. The following will be found useful: Amongst whites, there is abundant choice; Tapis Blanc has probably the largest flowers, is pure white, but being so dwarf, 1 foot, the flowers are liable to be splashed during heavy rains, still it is a handsome variety. Frau Von Lassberg is most desirable, and so is Amazone and Mrs. Jenkins, with Virgo Marie as an exceptionally late flowering variety, most useful in the herbaceous border, although small in its blossoms. In height it grows 4 feet. Miss Pemberton grows 18 inches high, very free in flower, lasts a long time, and is bright carmine-rose, with a dark centre. Amongst orange-scarlets Roger Marx, Coquelicot, and George A. Stroehlein are desirable. Violet and blue are well represented by Le Mahdi, Antonin Mercie, Queen Alexandra, Henri Farman, and Eugene Danzanvilliers. Rose or pink are obtained in Beauty, Comtesse Steinberg, Killarney, and Sheriff Ivory. Mrs. Oliver, salmon-pink; Matilda Serao, white, tinted lavender; Marguerite, porcelain-blue; and Eclaireur, dark carmine, quite one of the best, making huge panicles, are other fine varieties.
M. E.

Hampshire.

THE WHITE BEAM TREE.

Pyrus aria, or the White Beam Tree, as it is popularly called, is a well known British tree, which occurs in many parts of the country, particularly on chalky soil. Under favourable conditions it attains a height of 30 or 35 feet, but is frequently found on barren rocky ground, in more or less bush form, and not more than 8 or 10 feet high. A well-developed tree forms an ornamental object, for the large, ovate leaves are silvery on the undersurface, and are very effective when moved by the wind. The flowers are white, and borne in good-sized flat corymbs in May, and they are followed by large bunches of fruits, which, when ripe in September, are orange-scarlet. Added to these recommendations, it grows naturally into a shapely tree, and thrives in almost any position, being well adapted for exposed places, and being worthy of consideration for a wind break. As it starts into growth later than most trees it escapes late frosts, and it is rarely that even the tenderest leaves sustain injury. Birds are very fond of the fruits, so, unfortunately, they cannot be kept on the trees for a very long period.

The species is very widely distributed through the North Temperate Zone, and a great many variations from the type have been recorded, some of which have been given varietal names, and are cultivated for their ornamental qualities. Like other widely distributed trees, it has been blessed, or otherwise, at various times with a multitude of names, and has been placed in at least seven different genera, as follows: Pyrus aria, Aria nivea, Azarolus aria, Mespilus aria, Pirenia aria, Cratægus aria, and Sorbus aria. In addition to white beam tree, other common names have been used, and several are mentioned by Loudon, such as white wild pear, white-leaf tree, red chess-apple, sea ouler, Cumberland hawthorn, and Alisier allouchier, cog of a wheel, a name given on account of the wood at one time being largely used for cog wheels.

Many of the varieties likewise have been plentifully named, but those given below are the ones generally accepted. Many of these varieties are very ornamental, and worthy of cultivation amongst select collections of trees. P. aria angustifolia is a variety recognised by means of its small narrow leaves.

P. a. chrysophylla.—This is remarkable by reason of its yellowish foliage. The leaves are brightest when they first appear, but a fair amount of colour is retained until autumn. The fruit of this form is bright red.

P. a. flabelliformis is recognised by its large rounded leaves and fine heads of flowers and fruits.

P. a. græca is a very floriferous variety. The fruits are usually orange coloured, and for some reason they are left untouched by birds until all the other kinds are gone, which points to the fact that they are less pleasant to the taste.

P. a. lutescens.—This, like chrysophylla, has yellowish leaves, but less bright than those of that variety. The fruits are orange coloured.

P. a. majestica.—Of all the varieties this is the most handsome. The leaves are much larger than those of the type, the silvery colouring more marked, and the fruits of a richer red. The fruits are borne in large pendulous corymbs, and are particularly handsome.

P. a. quercoides is more curious than beautiful, the leaves being curiously shaped, but not handsome.

P. a. raticifolia is somewhat like angustifolia, and is noticeable by reason of its narrow leaves.

P. a. undulata differs from the type and other varieties by reason of the margins of the leaves being undulated.

For anyone who wants a couple of really good varieties only, P. a. majestica and P. a. chrysophylla should be selected.

W. D.

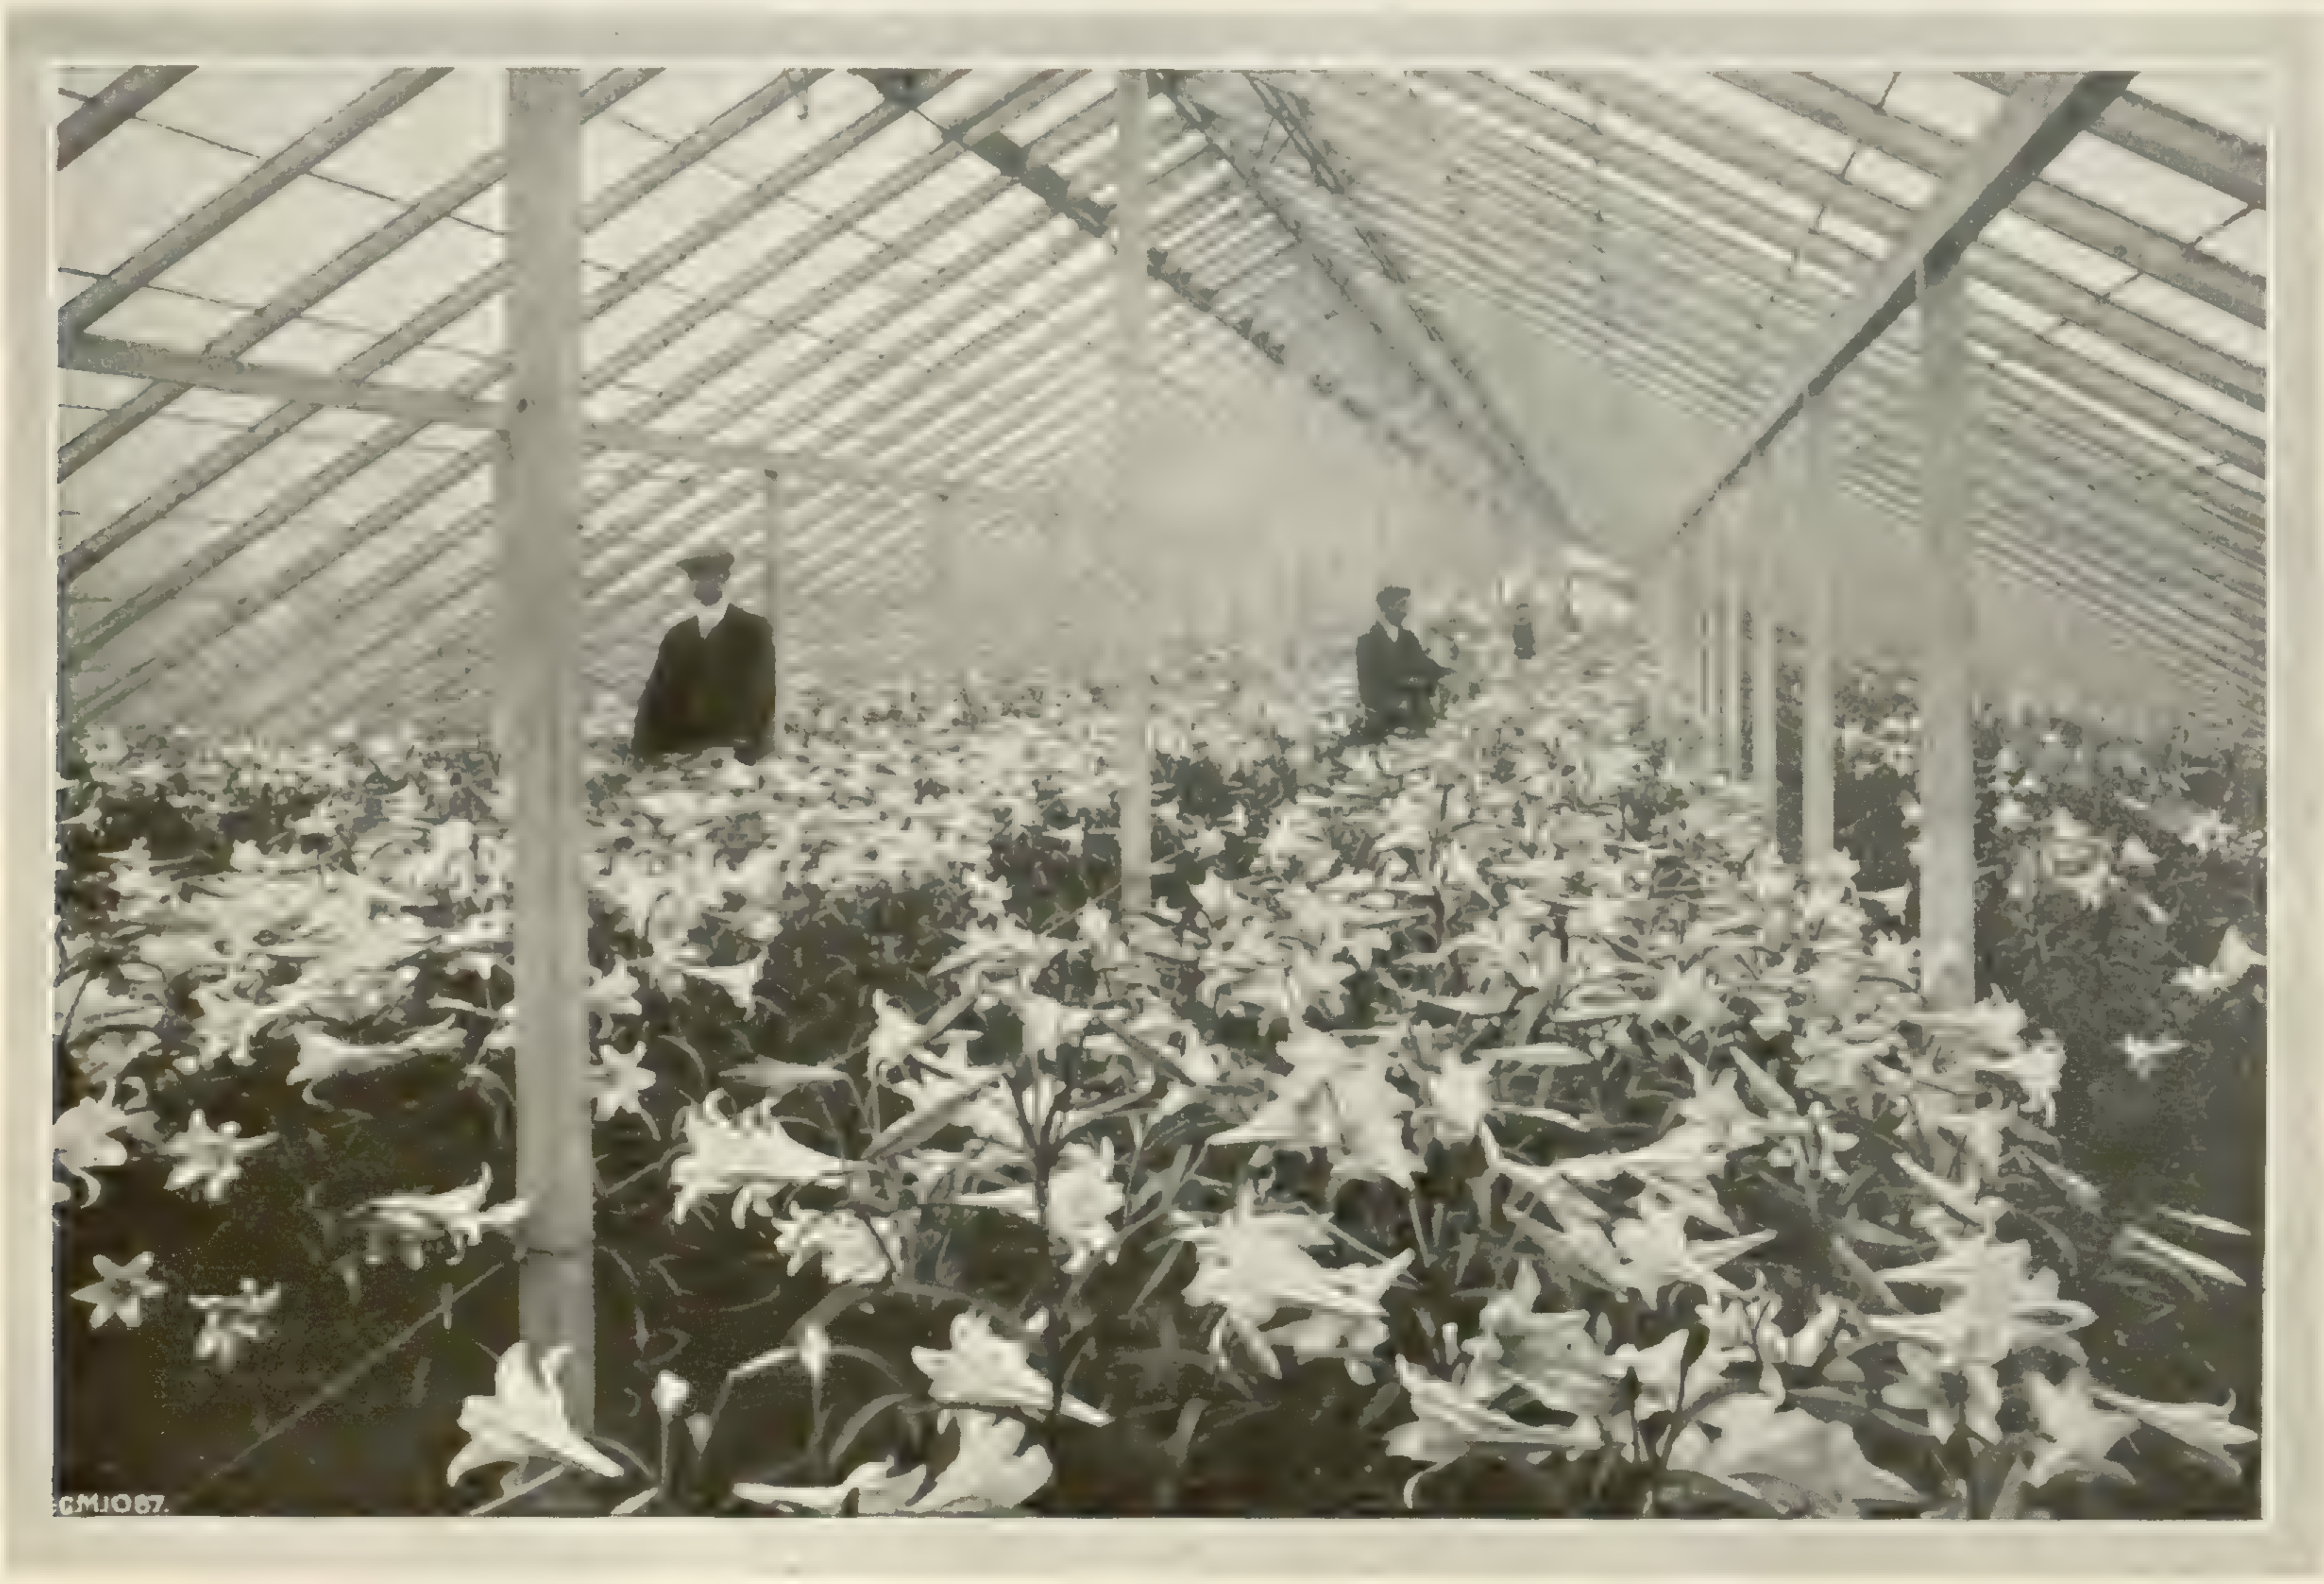
LILIUMS AT HAMPTON.

The name of Mr. W. H. Page, Tangley Nursery, Hampton, is now so well known to the flower-loving public in connection with the winter-flowering carnation, that I am inclined to think the accompanying photograph may prove of some interest to your readers, as it well serves to show to what extent and with what success the cultivation of Lilium longiflorum is undertaken by our market growers for the Christmas trade, though I doubt if there are many who attain such success as does Mr. Page. The house was photographed on December 17, and, as will be seen in the illustration, cutting had commenced a few days previously, particularly down the sides. The house is 190 feet long by 30 feet wide, and the plants are arranged in four blocks running the entire length of the house. It contained some 3,500 pots (large 24's), three bulbs in a pot, and from each pot there averaged twelve very fine blooms, though on many there were several in excess of this number.

This is only one of several houses of lilies in various stages of growth. Lilium speciosum album and L. speciosum rubrum make a very fine show in several houses, while several houses of carnations were looking extremely well, and crowded with bloom buds, the varieties White Perfection, Enchantress, President Roosevelt, and May Day being in grand condition.

As is the case with most of our successful market growers, Mr. Page deals only with a few things, but what he does, he does well. Liliums, roses, carnations, and narcissi are the chief crops.

T. STEVENSON.



LILIUMS FOR THE CHRISTMAS AND NEW YEAR'S MARKETS.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEASONABLE NOTES.—With the turn of the days the work in the orchid houses will become pressing. Forethought therefore is necessary to facilitate progress. By preparing potting composts, cleaning down the insides of the houses, stages, pots, etc., at the present season, we may avoid delay at the time when so many subjects need attention. While there is no frost a stock of sphagnum moss should be obtained. When procured at this season it may be stored either in a cool shed or in the open air, and if turned occasionally it keeps in good condition for months together. If the sphagnum can be picked by the outdoor members of the garden staff when conditions are not favourable to outside work, this will be of considerable advantage later on. It is a good plan to thoroughly wash the sphagnum before picking it, as this not only renders the moss clean, but also assists in removing slugs and their eggs, which are so frequently troublesome after plants have been freshly potted. While advocating that all composts should be ready for use, I do not consider it advisable that they should be intermixed until required for use.

STERILISING LEAVES. — Polypodium and osmunda fibre are at all times desirable for potting. In the case of decaying leaves there is always a possibility of small worms and insect pests, as well as fungi, all of which it is most undesirable to introduce to our houses. It is a good plan to place the leaves in a bag or sack, and plunge them into boiling water for a few minutes, after which they may be drained, dried, and chopped ready for use. In the case of osmunda fibre we frequently find quantities of tiny slugs and shelled snails when preparing it for use. This illustrates the necessity of taking every precaution to plunge the turves of fibre into the copper for a few seconds to effectually clear it of pests. The fibre can easily be drained and dried by placing it on the pipes in the stoke-hole or other convenient place.

CALANTHE BULBS.—Where the flower spikes have been removed, calanthe bulbs may now be turned out of their pots and placed under resting conditions. These plants are by no means ornamental when in a dormant state, and where the pseudo-bulbs are permitted to remain in the pots they occupy much room, which very often is needed for other purposes early in the year. There is no advantage in leaving the pseudobulbs in their pots; put all plants of the same variety together, turn them out of their pots, and after removing the potting compost, cut away all the roots to within an inch or so of the pseudo-bulb. Then place the bulbs in an upright position in ordinary seed boxes, about 3 or 4 inches deep, the bottom of the boxes having previously been covered with a layer of chopped sphagnum moss and silver sand. These boxes may then be stored on a shelf, or in some dry position in the house, where they may remain until the return of spring, and the plants show signs of renewed vitality. Where it is desirable to increase the stock the back bulbs should be saved, but be stored separately from the new bulbs; most old bulbs may be induced to produce growth if treated in the ordinary way.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

RESTING.—We have reached the first day of the New Year, and have still many weeks of cold, sunless weather to look forward to. We must therefore still consider this the resting period with many classes of stove plants. If the plants are resting we shall not have any need to be idle in the stoves. Yet it is much too early to be pushing things ahead. Within a quite recent period a great change in public taste has taken place with regard to stove plants, especially those grown for their foliage. Many of the older subjects with attractive leafage have been discarded in favour of flowering plants that require an intermediate temperature. The change is one that has its advantages, for we have now a race of begonias that has done much to oust many of our fine foliaged stove plants that were employed so generally for all kinds of house and table decoration. Moreover, specimen stove plants are grown in much smaller numbers, and the houses in most cases are used for the early forcing of all kinds of hardy shrubs, bulbs, etc.

TEMPERATURE. — The temperature of the houses at this season should not be too high. In the case of a house of crotons or dracænas, and other fine foliage plants, it should range from 65 to 67 degrees at night, this allowing for a slight fall before morning. For houses in which are begonias, euphorbias, poinsettias, and similar subjects, 55 degrees will be quite high enough at night, allowing for a 5 degrees fall before morning. Most of these plants will be quite at their best by now, and it only remains to keep them in good condition as long as possible.

WATERING.—All classes of stove plants must at this season be very carefully watered. In cases where the pots are near the pipes they must be watched, and not be allowed to become too dry, or a loss of foliage or flowers will result. This remark also applies to many of the stove climbers that are usually planted near the pipes; they require just enough water to keep the wood plump, and not sufficient to push them prematurely into active growth.

SYRINGINGS overhead may be given to crotons and a few other subjects on mild mornings, but not in the afternoon; rely more on frequently damping the paths and underneath the plants to ensure the necessary degree of atmospheric moisture. Dracænas resent overhead syringings during dull, cold weather, and if they can be arranged by themselves and kept fairly dry overhead for a few weeks, the leaves will remain in much better condition than when frequently syringed. If red spider or thrips are troublesome an occasional sponging with weak insecticide will keep these pests down, or what is quicker, a bi-weekly dipping will do away with the need of sponging except when necessary to brighten up the leaves. —T. Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

SECOND EARLY VINERY.—A vinery thoroughly cleansed, and otherwise prepared, and its borders top-dressed with fresh compost, should now be closed for the purpose of supplying a succession of fruit. Provided the house contains vines that have of late years been started early in the New Year, there need be no difficulty about the rods breaking satisfactorily into growth. Vines with their roots confined to inside borders are most suitable for starting at this date; in fact, we prefer inside borders in any case, and if the soil is at all dry it should be given sufficient tepid water to moisten it through. Use enough artificial heat to keep the night temperature at from 45 to 50 deg., and that for the day slightly higher; promote a fairly moist atmosphere, and on bright days syringe the vines in the morning, and again in the afternoon. Should any of the vines carry young rods bend these down in order to assist the buds to break throughout their whole length.

LATE VINERIES.—There should now be no delay in relieving vines of their fruit and safely storing it in a grape room, where the atmosphere can be kept dry, and a temperature of from 45 to 50 deg. be upheld. To afford the vines the benefit of a perfect rest, fully open (except when frosts are very severe) the ventilators of the house, and prune the vines by cutting each lateral back to two good basal buds, i.e., if the ordinary short spur method of pruning is adopted. This should be done without delay, and be followed by giving inside borders an efficient watering and by thoroughly cleansing the house and its vines. In attending to the vines, first free them of all loose bark, particularly of that from about the spurs, and thoroughly wash them with a suitable brush and a fairly strong insecticide. The most effectual way, however, of dealing with mealy bug is by cyaniding, but the inexperienced operator should obtain an expert's advice before venturing upon this method of insect eradication. After removing the surface of the borders top-dress with a fresh compost of sound loam, freely mixed with wood ashes, fine mortar rubble, and a smaller quantity of a good artificial vine manure.

MELONS.—There is no gain in raising melon plants before the New Year commences, but those raised from seeds sown now will have the benefit of lengthening days in which to develop, and with the assistance of favourable weather there should be no difficulty in securing from a free-setting early variety good ripe fruits by the end of April. For the seeds use 2½in. pots filled with fine loam, slightly mixed with leaf-soil, plunge the pots in a gentle hotbed, and cover with a sheet of glass, which will both assist germination and protect from mice. As soon as the plants appear, place them near the glass, upon a shelf, where they have a night temperature of from 65 to 70 deg. with a corresponding rise by day. In our case a pine house is made use of for this purpose, and the plants are subsequently put out at two feet apart in a firm ridge composed of sound loam mixed with crushed mortar rubble and a little soot. This ridge is placed well up towards the glass, over a bed of tree leaves, with heated pipes beneath it. Failing conveniences of this description, a carefully prepared hotbed, formed of tree leaves and stable litter, should be made ready for planting. — T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

PLOT ARRANGEMENTS.—To become successful in the cultivation of vegetables, a plan of the garden is far more important than perhaps appears. A plan can easily be made of the vegetable quarters, in which the names of the future subjects should be inserted. It will then become an easy matter to prepare each piece of ground to suit the requirements of the intended crop. Such a system as suggested is the most satisfactory, and expense is curtailed in the application of manure, as many taprooted vegetables require no manure if a good dressing of burnt refuse, soot, etc., is given when trenching.

PREPARING THE GROUND. — Some growers advocate autumn preparation, others the spring. Which is best can only be decided on the spot, when one knows the nature of the soil. Light or sandy soils can be prepared with advantage in the autumn or early in winter, leaving the heavy land until February or March, though this should be turned over roughly the previous autumn, after the crops were stored, for the weather to pulverise and sweeten.

BROCCOLI.—Should not enough be turning in to meet the demand, take up the forward-looking ones with a good ball of earth attached, and place them in pits, or even frames, and encourage them in every way, but give air on all favourable occasions.

SEAKALE.—If this crop is not already taken up, lose no time in lifting it. The best and healthiest root-thongs should be cut off and prepared for sets during bad weather, the forcing crowns being laid in soil or fine ashes in a cold yet sheltered situation, until required for forcing. Introduce chicory, rhubarb, and endive to the mushroom house as the demand requires it.

GENERAL REMARKS.—Have fir boughs, bracken, or long litter in readiness for protecting celery, broccoli, and other tender vegetables, but uncover these during favourable weather if only for a few hours in the day. Have quantities of loam, sand, leaf-soil, and burnt refuse under cover, as many seeds will have to be sown towards the middle of the month. Make boxes about twenty inches long, nine inches wide, and two and a-half deep, for seed sowing. Stand early varieties of potatoes upright in boxes in a light position to sprout previous to planting in pots and frames.—G. Ellwood, Swanmore Park Gardens.

THE LEAMINGTON AND COUNTY FLOWER SHOW
will be held in the
VICTORIA PARK, LEAMINGTON,
on
WEDNESDAY and THURSDAY, July 27th and 28th, 1910.

EXHIBITIONS AND MEETINGS.

◆

National Dahlia Society.

DECEMBER 21.

The annual meeting of this society was held at the Hotel Windsor, Westminster, on December 21, when Mr. E. Mawley, V.M.H., presided over a small attendance. The minutes of the last annual meeting having been read and confirmed, Mr. E. F. Hawes, one of the co-hon. secretaries, read the annual report, which is as follows:

ANNUAL REPORT.

It had long been felt that there was no room for two societies devoted to the interests of the dahlia, and the committee are glad to be able to record the amalgamation, at the close of 1908, of the London Dahlia Union with the National Dahlia Society. This year two shows have been held, one at the Crystal Palace, on September 2 and 3, the other at the Botanic Gardens, Regent's Park, on September 21 and 22. The wet cold summer was altogether unfavourable to dahlias, and the early show suffered considerably owing to the late season. The classes for amateurs were fairly well contested, although there was a falling off in the classes devoted to those who had never won a prize at any previous exhibition of the society.

At the second show, at the Botanic Gardens, practically all the classes were well filled, and the attendance was most satisfactory. The total number of entries for the two shows was 387.

Altogether some 150 new varieties were submitted to the society, and ten certificates were awarded, four at the first show, two at the second, and four by a joint committee of the Royal Horticultural Society and National Dahlia Society. Twenty certificates were awarded to new varieties last year; fifteen in 1907.

The committee paid a visit to Slough and inspected the trials of pompons in Mr. Charles Turner's nursery. Several varieties obtained three marks as garden dahlias, and others gained three marks as exhibition varieties. These are named below. The committee wishes to acknowledge its indebtedness to Mr. Turner for his valuable assistance in conducting this trial.

The committee desire to convey their best thanks to the donors of special prizes, viz., the President, the Crystal Palace Company, Messrs. J. Cheal and Son, Messrs. Dobbie and Co., Mr. S. Mortimer, Messrs. J. Stredwick and Son, Mr. John Pinches, Mr. R. Sydenham, Messrs. T. S. Ware, Lim., Mr. John Walker, Mr. W. Stephens, and Mr. J. S. Brunton.

Arrangements are being made to hold two exhibitions during 1910, one at the Crystal Palace, on September 8 and 9, and the other at the Royal Botanic Gardens on September 20 and 21.

It has been further arranged to hold a conference on dahlias in March, at the Essex Hall, Essex Street, Strand. This, it is hoped, will have the effect of stimulating interest in the dahlia world.

It is interesting to record that for the first time this year the N.D.S. offered prizes for pæony-flowered dahlias, also for garden cactus varieties, and, further, decided to award certificates to any new cactus varieties considered to be suitable for garden decoration.

Three new sections are enumerated in the "Supplement" for 1910, namely, pæony-flowered, decorative, and collarette, with a list of the most useful varieties under each particular heading.

Three marks have been awarded as the result of the pompon trials at Slough to the following exhibition varieties: Edith Bryant, Daisy, Clarence, Mars, Douglas, Cyril, Portia, Montague Wootten, Ideal, Orpheus, Nellie Broomhead, Nerissa, Tommy Keith, and Adela. Garden varieties: Darkest of All, Daisy, Mars, Falcon, Iris, Portia, Montague Wootten, Ideal, Isabel, Romulus, Silvia, Nerissa, Tommy Keith, White Aster, Whisper, Vara, Zerlina, Virginale, and Adela.

Mr. E. Wilkins, the honorary treasurer, presented a financial statement and balance-sheet for the year. The financial statement showed that the income, including the balance of £6 6s. 2d., from the previous year, amounted to £193 10s. 4d. Of this amount the sum of £89 11s. 6d. was received as subscriptions, £25 from the Crystal Palace, and £22 15s. for admission to the exhibition in the Royal Botanic Gardens. The expenditure amounted to £194 17s. 11d., and of this amount the sum of £129 8s. 6d. was disbursed in prizes, £9 12s. 7d. in medals, and £14 16s. 6d. in challenge cups.

The President, in moving the adoption of the report, financial statement, and balance-sheet, referred to the unfavourable character of the season, so far as it related to the dahlia, and to the good work that had been accomplished in various directions. He felt the time had come when a special effort should be made by the society to bring into greater prominence the value of dahlias for garden decoration, and he anticipated much good from the conference that will be held in March next. Other speakers included Mr. J. Cheal, Mr. G. Gordon, Mr. Brousson, Mr. Stredwick, and Mr. West. At the close of the discussion the motion was carried unanimously. Mr. E. Mawley was re-elected president, and Mr. G. Gordon, chairman of committee. Mr. Wilkins having intimated his intention of retiring from the treasurership, he was elected a vice-president, and Mr. G. Green was elected treasurer. Mr. H. H. Thomas retired from the position of co-hon. secretary owing to his many engagements, and Mr. E. F. Hawes was elected hon. secretary.

Votes of thanks to the officers, and to Mr. E. Mawley for presiding closed the proceedings.

St. Ives.

The eleventh annual exhibition of the St. Ives Farm and Dairy Produce, Root, and Fruit Society was held, as in former years, in The Broadway, St. Ives, Hunts, on Monday, December 20, and proved very successful. The quaint old town of St. Ives on this occasion is thronged with visitors from the surrounding villages and towns, and the show, being held on a market day, is looked forward to with much interest. Probably this show is almost unique in its kind, a huge marquee being erected in the middle of the main street, lighted with gas, and charmingly decorated with plants and flowers; and, above all, the competition was extremely keen in almost every department. Farm produce was largely shown, and potatoes, onions, and hardy fruits made a brave show. The fruit included some of the most perfectly-finished and highly-coloured apples and pears that had been exhibited in the last quarter of 1908. For five culinary apples every dish shown was first-rate, the leading prizewinners were: Sir A. W. Marshall, Buckden Towers; Mr. F. Rule, Needingworth; Mr. R. Brown, Somersham; and the most notable examples were those of Bramley's Seedling, Wellington (very fine), Peasgood's Nonsuch, and Mère de Ménage. For five Cox's Orange Pippin, Mr. R. M. Copley, Burleigh Hall, St. Ives, staged an extraordinary dish, the fruits being large, perfectly shaped, and highly-coloured; Mr. G. D. Day, St. Ives, second with specimens large in size, and of high quality. For five specimens of any kind of dessert apples, Cox's Orange Pippin excepted, Mr. R. M. Copley was again first, staging Ribston Pippins of the highest quality; Mr. T. Longman, Warboys, second; and Mrs. G. Hobbs, Ramsey, third. For three dishes of cooking apples, Sir A. W. Marshall was well first; Mr. C. Cousins, Croxton Park, second and third. For three dishes of dessert apples Mr. R. M. Copley was a splendid first, and Mr. C. Cousins second and third. For a dish of twelve apples, cooking and dessert mixed, two of each, Mr. R. M. Copley again scored in a fine competition; Mr. C. Cousins second; and Sir A. W. Marshall third Pears were equally well shown. For five dessert pears Mr. T. Longman was first and second with magnificent and splendidly-preserved Doyenne du Comice; Mr. G. D. Day third. For three dishes of dessert pears, distinct, Mr. Longman was again first, showing very fine Doyenne du Comice; Glou Morceau, and Josephine des Malines; Sir A. W. Marshall second; and Mr. R. M. Copley third.

Potatoes were splendidly shown. Mr. C. Cousins was first, and Mr. C. H. Coote, Houghton Grange, second for twelve kidney varieties. For twelve rounds Mr. Coote was first, Mr. Cousins second, and Mr. E. E. Chambers, St. Neots, third. Onions were largely shown, and the specimens generally well preserved. For twelve Mr. C. Cousins was first and second with perfectly-finished bulbs. Mr. C. E. Girling, Hemingford, third. The committee and officers of the society are to be highly congratulated on the success they have achieved, and especially the secretary, Mr. G. H. Cannon.

Royal Horticultural Society of Ireland.

On December 19 the annual meeting of this society was held at 35, Dawson Street, Dublin, under the presidency of Captain Lewis Riall, when the following report was submitted.

The council congratulates the society on its improved position, both financially and in number of members. Through the courtesy of the Royal Dublin Society, as presaged in last year's annual report, your council was able to hold the Spring Show in the Arts Industries Hall, Ballsbridge, in conjunction with the Spring Cattle Show; the Royal Dublin Society gave the use of the hall free, with a grant of £50 towards expenses. The results were satisfactory to your society, and it is hoped also to the Royal Dublin Society. Your council desire to express sincere thanks to the Royal Dublin Society for the facilities and assistance given on the occasion of this show, and for permitting the experiment to be tried. Arrangements are now practically concluded for again holding the Spring Show in conjunction with the Royal Dublin Society's Spring Show at Ballsbridge in 1910. The Summer Show, held in Merrion Square, was, unfortunately, not a financial success, and resulted in serious loss to the society. In point of number of entries, and in the excellence of the exhibits, this show was a record for recent years, and it is therefore the more to be regretted that so few people took advantage of the opportunity of seeing it. The same apathy on the part of the public was in evidence at the Winter Show at Ballsbridge, which entailed serious financial loss to your society. Special commendation must be given to the quality of the great majority of the exhibits at this show, the quality of both apples and pears showing what a distinct advance has been made in fruit culture in Ireland. The fine colour and finish of many of the exhibits from Clare, Cork, Kilkenny, and other counties, is evidence of the steady progress which is being made in Ireland in the important industry of fruit growing. Prizes in important sections were given by the Department of Agriculture, and by the Royal Dublin Society, to encourage this special branch of your society's work, and valuable assistance was also given by the Dublin Industrial Development Association. Your council does not feel justified in risking so heavy a loss on a winter fruit show in 1910, and, further, with the desire of encouraging other branches of gardening, purposes, subject to your approval, to hold the following shows in 1910: (1) A narcissus and general spring show in April, at Ballsbridge; (2) a summer show early in July, for roses, herbaceous plants, flowering plants, fruits, and vegetables; (3) an autumn show late in August for sweet peas, dahlias, carnations, flowering plants, fruits, vegetables, etc.

The losses sustained by the society in members during the year being seven by death and eleven by resignation, the total membership now stands at three honorary, 44 life, 317 annual, and 73 practical members, with three affiliated societies—a total membership of 440. The council take the opportunity of expressing grateful acknowledgments to the donors of prizes, whose generosity has enabled the society to maintain the status of its prize list, best thanks being due to your president, Lord Ardilaun, the Marquis of Londonderry, Viscount Iveagh, the Department of Agriculture, the Royal Dublin Society, Lady Albreda Bourke, Lady Annaly, Clara Lady FitzGerald, Mrs. Greer, Mrs. Goodbody, Sir Horace Plunkett, K.C.V.O., Sir J. G. Nutting, Bart., John Jameson, Esq., D.L., and Messrs. Hamilton Drummond, F. W. Moore, H. P. Goodbody, Rev. T. Harris, Ernest Bewley, W. H. Odlum, R. White, James M'Kellar, James Inglis, W. P. Geoghegan, Howard St. George, L. O. Hutton; also the firms of Messrs. Hogg and Robertson, Mr. Hugh Dickson, Messrs. Thomas M'Kenzie and Sons, Lim., Messrs. Edmondson Brothers, Messrs. Charles Ramsay and Sons, Mr. Thomas Smith, Messrs. W. Drummond and Sons, Lim., Messrs. Sir J. W. Mackey, Lim., Mr. S. A. Jones, Messrs. Hopkins and Hopkins, Messrs. Dicksons, Lim., Chester; Messrs. Henry Eckford and Sons, Messrs. William Thomson and Sons, and Messrs. Thomas Rivers and Sons (per Messrs. Edmondson Brothers).

The Chairman, in moving the adoption of the report, congratulated the members on the splendid work that had been accomplished during the year. It was much to be regretted that the attendance of visitors, both at the summer show in Merrion Square and at the winter show at Ballsbridge, fell so far short of what it should have been, having regard to the great excellence of these shows. It was most desirable there should be an increase in the membership, for if they had an increase of from 150 to 200 members, the society would be self-supporting. The motion was seconded by Canon Hayes, and carried unanimously.

Messrs. W. F. Gunn, F. W. Moore, V.M.H., George M. Ross, H. P. Goodbody, Robert Anderson, C. M. Doyne, D.L., and T. F. Crozier were elected members of council. Votes of thanks were passed to Messrs. Dudgeon and Crozier, the auditors; Mr. E. Knowldin, the hon. secretary; Mr. F. W. Moore; and the Chairman.

Bournemouth Gardeners' Association.

The members of this association met on Tuesday, December 21, to hold the last meeting of the year. "Questions and Discussion" formed the programme. Occasionally meetings are held when questions on various subjects connected with horticulture are put down on strips of paper by the members present, and are then placed in a box. The chairman takes out the questions one by one, and reads them; as each one is read a discussion on it follows, and in this way the member asking the question receives valuable information.

The following are a few of the more interesting of the questions put, namely: "The Best Way of Growing Dandelions for Salad." Various replies were given, the one finding most favour being as follows: Cultivate the plants in the open ground similarly to chicory during the summer months, then lift the roots carefully, plant them in beds of soil, or flower pots, and force the crowns as seakale is forced. Earthing-up in the open border was also advocated.

Another question was: "What is the best plunging material for forcing plants in?" Cocoanut-fibre refuse was the material most favoured. Sawdust, ashes with the fine dust removed, and cork dust were also recommended.

Another important query was, "Why do certain branches of apricot trees go wrong while in full leaf?" Several theories were advanced, but no member could, in giving his opinion, feel that he was perfectly right. Some thought that imperfect root action was the cause; others were of opinion that, through some kind of check being given the previous year the sap vessels were damaged, and then, when the new growths had exhausted the stored-up sap the branch collapsed owing to lack of fresh sap, which could not flow on account of the damaged vessels. A hearty vote of thanks to Mr. Dowell, the chairman, brought to a close a very enjoyable evening.

Reading Gardeners' Association.

At the final meeting of the 1909 session on Monday, December 20, there assembled one of the best gatherings of members ever seen in the Abbey Hall, Mr. A. F. Bailey (chairman) presiding, when, apart from the usual fortnightly lecture, there was the attraction of a magnificent exhibit of onions put up by Messrs. Sutton and Sons.

After the minutes of the last meeting had been read and confirmed, the nomination of officers for the coming year was proceeded with.

The lecturer for the evening was Mr. E. Hickey, of the gardens, Maiden Erleigh, one of the prizewinners at Mr. Chas. Foster's classes for young gardeners held during last winter. The subject was "How to plant a bush fruit garden, 44 yards square." It was at once manifest that Mr. Hickey was perfectly at home with his subject, and he rendered his paper in a clear and forcible manner, which thoroughly engaged the attention of his audience throughout. Taking gooseberries, currants (red, black, and white), raspberries, and loganberries as the subjects for his bush fruit garden, the lecturer gave full instructions as to the preparation and planting of the ground and all information respecting the after-treatment of the trees. He also gave a comprehensive list of the best varieties in each class to grow, stating fully the qualities and chief characteristics of the different trees, and concluded his paper by excellent advice on the prevention and eradication of many of the pests to which bush fruit trees are subject.

Mr. Hickey was most heartily applauded, and in the debate which followed, he was

repeatedly complimented by the speakers on the really able manner in which he had delivered his "maiden" paper. Mr. Hickey answered readily all questions put to him by the members, and at the close of the meeting received a very hearty vote of thanks.

Mr. D. Turner, head gardener to A. E. Huggins, Esq., Wargrave Hill, exhibited well-grown Ailsa Craig onions.

The annual general meeting of the association is fixed for Monday, January 10, 1910.

Hawick Horticultural Society.

The annual business meeting was held a few days since. The annual report which was submitted to the members showed the society to be in an active and otherwise satisfactory condition. Two very successful shows were held during the year. It was resolved to have the summer show on Saturday, August 27, and two days' chrysanthemum show in November, on dates yet to be fixed. The following office bearers were appointed to carry on the work for the coming year: President, John Turnbull, Esq., Beaconsfield Terrace; vice-presidents, Mr. A. Forbes, Buccleuch Nurseries; Mr. Alex. Wood, Wilton Lodge Nurseries; and Mr. A. Kyle, Yarrow Terrace; committee, Messrs. A. Glendinning, William Gordon, H. Ferguson, R. Fisher, G. Hogg, A. B. Haig, R. Hope, T. Kennedy, D. Miller, D. Oliver, R. Reid, John Ruthven, and W. Rutherford; treasurer, Mr. G. H. Blake, Beaconsfield Terrace; Mr. William Oliver, 20, Slitrig Crescent, was again unanimously appointed secretary.

TRADE NOTE.

A very striking single chrysanthemum is the one named Caledonia that was shown so well and at so many of the leading shows in November and early December last. We received a few flowers from Messrs. G. Williams and Sons, of Manor House Nurseries, Cardiff, and were surprised at the substance and size of the blooms, many of them exceeding seven inches across. The colour is rosy pink, with a white zone round the disk. To the notification that the variety has gained a Certificate at Edinburgh, and an Award of Merit from the Royal Horticultural Society, there is no need to add further evidence of the merit of the variety.

The Gardening Year Book for 1910.—The continued increase in the popularity and sales of an annual publication that has reached its fifty-second year is of interest as evidence of the appreciation by its many thousand readers of the care that is taken to keep the immense amount of information it contains fully abreast of the times; and to add from time to time such new features as are likely to add to its interest and usefulness. As in previous years, "A Year's Work in the Garden" is dealt with in a series of monthly chapters, and a page of ruled paper is provided in each month for memoranda relating to the garden. New plants, orchids, flowers, fruits, and vegetables that were introduced in 1909 are concisely described and many are illustrated. The chapters on hardy border flowers, conservatory plants, fruits, and vegetables contain such information as will enable the reader to select the finest kinds, and to grow them to a high degree of perfection without special difficulty. The chapters on insect pests and fungoid diseases afford much information on the identification and life history of the many enemies of plant life and the best means of combating them. To those who are interested in horticultural societies and public parks the directories of these will be of much value, for they are full and trustworthy. The book, neatly bound, is published by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C., and the price is 1s. net, or post free, 1s. 3d.

ANSWERS TO CORRESPONDENTS.

DECORATIVE AND SINGLE CHRYSANTHEMUMS.—R. H. H., Banbury: Half a dozen excellent decorative chrysanthemums suitable for exhibiting early in November are Source d'Or, Crimson Source d'Or, Lizzie Adcock, Etoile Blanc, Phœbus, and Charles Davis. Other good varieties are Florence Davis, Lady Hanham, Soleil d'Octobre, W. Seward, Viviand Morel, and Lady Hopetoun. Good single varieties are Edith Pagram, Bronze Pagram, Metta, Mensa, Jessie Curtis, and Mrs. H. Redden, with such varieties as Merstham Jewel, Exmouth Yellow, Altrincham Yellow, Crown Jewel, Mary Anderson, Roupell Beauty, and Modesty.

PLANTING BELLADONNA.—T. A. K., St. Ives: If you refer to the Belladonna Lily (Amaryllis Belladonna), then we have to say that the bulbs planted near fruits and vegetables are not at all likely to produce any injurious effects, but if so planted we should not expect the lilies to be a success, as a well-drained warm border, sheltered by a terrace wall, or greenhouse wall, is the place where success is most likely to be achieved. If, however, you refer to the Belladonna (Atropa Belladonna), then your reference to bulbs does not hold good, because it is the berries of the Belladonna, a solanaceous plant, that are so exceedingly poisonous. It should be kept out of the kitchen garden. But perhaps you are thinking of the deadly Aconite (Aconitum napellus), which has stout, fleshy roots, somewhat like horseradish; this plant should not be allowed in the kitchen garden under any pretence or consideration, lest its roots be mistaken for something else, and fatal results follow

SOOTY MARKS ON LEMON LEAVES.—N. D. C., Taunton: The sooty marks on the leaves are due to the presence of a fungus, a species of Meliola. Set to work at once to thoroughly cleanse the tree and its surroundings, using warm water to which a little soft soap has been added. Change the water frequently during the operation. When this has been done remove the leaves that still show very large sooty areas, and burn them, and then syringe the tree with an approved insecticide. Take every care to keep the tree clean, because aphis gather on lemon and orange leaves and secrete honeydew, and it is on this exudation that the fungus seems to appear, eventually affecting the leaves and so injuring them that they cannot perform their functions, and so the tree is weakened. Once the tree is clean, keep it clean, and "sooty-mould" will not appear.

PROPAGATING DIEFFENBACHIAS. — A. P. P., Heaton: Dieffenbachias are very easily propagated in a moist atmosphere, especially in a heated pit, where there is some bottom heat. The tops may be "rung" and mossed up, and when new roots have formed these tops may be removed and potted in the same way as dracænas. But where a number of plants are needed the old stem, after the removal of the top, should be laid in cocoanut fibre refuse, in a hand-light or frame, in the pit, over bottom heat. Under these conditions, and kept moist, the latent buds in the stem will soon begin to push into growth, and roots will form along the nodes of the old stems also. When these young growths are a few inches high cut through the old stem on either side, and pot them up, or remove then with a slice of the old stem, and treat them as cuttings; putting them in sandy soil, and keeping them in the propagating frame until rooted. D. nobilis, D. Leopoldi, D. Chelsoni, D. D. Baraquiniana, D. Rex, D. Regina, D. magnifica, and D. Carderi are all good dieffenbachias.

CREEPING DAVALLIA.—F. E. H., Abingdon: Almost all the davallias are of creeping habit, so that to ask us to name any one species on the description given is to put an impossible question. However, the suggestion that the fronds are not unlike some adiantums leads us to believe that the plant in question is Davallia repens, a Bornean species, with simply pinnate fronds, ranging from eight to eighteen inches in length. It is an interesting and graceful fern, suitable for basket culture, or for a raft or piece of old tree fern stem. Odontoloma repens is a name under which it was formerly known. Persuade your friend to send us a frond, and we will do our best to identify it.

GALLS ON LEDUMS.—S. W. C., Killarney: The gall-like productions on the leaves of the ledum are produced by a fungus that is a form of Exobasidium rhododendri. This latter is found on Rhododendron hirsutum and R. ferrugineum. It is not often the disease spreads in such a way as to do great harm, and so far as our experience goes it does not attack the stronger pontic and other garden varieties of rhododendrons. The only means of infection is by spores, and these are produced in summer, the outward and visible signs of their readiness to disperse being a delicate "bloom" over the gall-like swellings. To prevent infection the plants attacked should be carefully and regularly examined each spring and early in summer, all affected leaves being removed and burnt as soon as detected. In this way the dispersion of spores is prevented, and the possibility of a recurring attack is reduced to a minimum.

CASHEW NUTS.—T. W. J., Hendon: The Cashew Nuts are the reddish fruits of a West Indian tree, named Anacardium occidentale. The flowers are small, yellowish, and very sweetly-scented. The plant is of fairly ornamental character, and is occasionally grown in a collection of stove plants.

DWARF ROSES. — C. M., Rochester: Dwarf roses are usually budded, and the aim of the propagator is to insert the bud as close to the root-stock as possible, because this reduces the propensity of the stock to throw suckers after the scion has grown away, and low budding induces the scion itself to root out below the soil, so that in a year or two the rose is practically on its own roots in many instances. So far as we are aware, there is no book dealing solely with the subject of budding and grafting. You would find "Roses and their Cultivation" (2s. 10d., post free, GARDENERS' MAGAZINE Office, 148, 149, Aldersgate Street, E.C.), of very great help to you.

NEW APPLES.—G. H. D., Sittingbourne: You can obtain the various new apples referred to on p. 956 of our issue of December 4, 1909 (at least, so far as they are in commerce) from or through any of the leading fruit tree specialists and nurserymen who advertise in our columns. Write, asking for quotations for the quantities and varieties you wish to secure, to several of the firms, and kindly mention that the varieties were referred to in our columns.

NAMES OF PLANTS.

F. E. H., Abingdon.—See separate answer.

T. S., Merton.—1, Cypripedium insigne; 2, Panax Victoriæ.

B. L. R., Lincoln.—1, Abies Douglasi; 2, Skimmia japonica; 3, Jasminum nudicaule.

S. C. D., Bournemouth.—1, Luculia gratissima; 2, Abutilon megapotamicum; 3, Davallia pallida.

NAMES OF FRUITS.

L. R., Staines.—1, Probably Scarlet Pearmain; 2, Gravenstein; 3, Alfriston.

C. W. G., Chingford.—1, Hacon's Incomparable; 2, Passe Colmar; 3, Forelle.

A. N., Worcester.—1, Emperor Alexander; 2, Braddick's Nonpareil; 3, not recognised.

M. B. B., Malvern.—1, Verulam; 2, Ribston Pippin; 3, Golden Noble; 4, Mère de Ménage. Very good samples.

FORTHCOMING ENGAGEMENTS.

MONDAY, January 10.—Royal Horticultural Society, Parks Examination, 10 a.m.

Reading Gardeners' Association, Annual Meeting.

TUESDAY, January 11.—Royal Horticultural Society; Meeting of Fruit, Floral, and Orchid Committees, at noon; Scientific Committee, 4 p.m.

SATURDAY, January 21.—Société Francaise d'Horticulture de Londres, Annual Dinner.

MARKETS.

CATALOGUES RECEIVED.

DOBBIE AND CO., ROTHESAY.—This firm has issued a most attractive and useful catalogue. Seeds and plants are listed, and florists' flowers, notably sweet peas, violas, dahlias, fuchsias, pelargoniums, marigolds, and aquilegias are given special prominence.

W. J. GODFREY, EXMOUTH.—In this catalogue of chrysanthemums Mr. Godfrey is offering five Japanese, four decorative, and nine single varieties, all new, in addition to many new varieties from other raisers and a list of old and popular sorts.

MISS HEMUS, UPTON-ON-SEVERN.—Twenty-four pages are devoted wholly and solely to sweet peas, and make up a very interesting catalogue of these popular flowers. Miss Hemus lists twenty-four pedigree novelties for 1910, but two of these she cannot supply until next season.

Death to Rats and Mice.
'Liverpool' Virus
in tins. Ready prepared with the Bait. Harmless to all animals except Rats and Mice. No smell from dead bodies.
Virus for Rats, 2/6 and 6/- Virus for Mice, 1/6.
Prepared in England by English Scientists. Of all Chemists.
Full particulars from Sole Wholesale Agents:—
Evans, Sons, Lescher & Webb, Ltd.
56, Hanover St., Liverpool, and
60, Bartholomew Close, London.

NATIVE GUANO
BEST and CHEAPEST MANURE for VEGETABLES, FRUITS and FLOWERS.
Price £3 10s. per ton in bags. Lots under 10 cwt. 4s. per cwt. at works; or 5s. per cwt., carriage paid to any station in England.
Extracts from 32nd annual collection of reports:—
NATIVE GUANO for POTATOES, VEGETABLES, etc.
J. HAYDON, Hampton: "Potatoes, excellent crop; none diseased. Grand for keeping away slugs."
G. PERRY, Westcliffe. "Peas and onions splendid."
NATIVE GUANO for FRUIT, ROSES, TOMATOES, etc.
A. W. BRINKHAM, Hull: "Cucumbers, tomatoes, and chrysanthemums highly satisfactory." G. ACCLETON, Carlisle: "Finest manure ever used for vines, peaches, roses, carnations, etc." W. COOPER, Shoeburyness: "Most excellent for roses."
Orders to the NATIVE GUANO CO., LIMITED, 29, New Bridge Street, London, E.C., where 32nd year's testimonials, etc., may be obtained. Agents Wanted.

VEGETABLES

AND THEIR

CULTIVATION.

A COMPLETE GUIDE TO THE KITCHEN GARDEN.

By **T. W. SANDERS, F.L.S.,**
Editor of "Amateur Gardening," etc.

Crown 8vo.; Cloth; 464 Pages.
140 ILLUSTRATIONS.

5/– NET.
By Post, 5/6.

8 PHOTO PLATES
and 5 COLOURED PLATES.

CONTENTS.

FORMATION OF THE VEGETABLE GARDEN.—Site—Shelter—Plans of one acre, half-acre, and quarter-acre Gardens—Drainage—Paths—Edgings—Boundary Hedges and Fences, with approximate cost of same.

SOILS AND THEIR TREATMENT.—Clay, Loam, Sandy, and old Garden Soils—Testing, Paring and Burning—Trenching—Ridging and Digging—Amelioration and Nitrification.

MANURES AND THEIR USES.—Nitrogenous, Phosphatic and Potassic—Natural and Artificial—Mixing and Application of Manures—Every kind of Manure described.

CROPS AND THEIR ROTATION.—Three and Four Course Systems—Catch Crops—Successional Cropping.

GENERAL OPERATIONS. — Planting — Watering—Seed Sowing—Seed Saving—Thinning Crops—Tools and their Uses—Seed Store —Mulching, Forcing, Retarding, etc.

EXHIBITING.—Growing—Staging—Packing, etc.

PESTS AND DISEASE.—Every prominent Pest and Disease fully described, and remedies for their eradication or prevention given.

POPULAR VEGETABLES.—Common Names —Botanical Names—Foreign Names—Natural Order—Native Habitat—History—Duration—Uses, etc.

CULTURAL DETAILS FOR EACH VEGETABLE.—Suitable Soil—Manures for Sowing —Planting—Propagation—Forcing—Lifting and Storing—Gathering, etc.

SELECTION OF VARIETIES.—List of bes kind for Culture for Home use and for Exhibition.

GARDEN FRIENDS. — Birds—Earthworms—Frogs and Toads—Hawkflies—Ladybirds—Lace-wing Flies—Tiger Beetle—Devil's Coach Horse Beetle—Garden Spider—Testacella Slug.

USEFUL TABLE FOR VEGETABLE GROWERS.—Name—When to Sow or Plant —When ready for use—Number of days seeds take to germinate—Time crop takes to reach maturity—Longevity of Seeds—Quantity of Seeds, Tubers, etc., to sow or plant a row of 50 ft.

CALENDAR OF OPERATIONS.—Showing work to be done in connection with each Vegetable during each month in the year.

ORDER FORM.

To the Publishers of "AMATEUR GARDENING,"
148 and 149, Aldersgate Street, London, E.C.

Please send me a copy of **"VEGETABLES AND THEIR CULTIVATION"** *by Post, for which I enclose remittance of* **5/6.**

Employment THE GARDENERS' MAGAZINE Register.

The charge for an Advertisement INCLUDES A FREE ENTRY ON THE REGISTER. Immediate Notice must be given when an engagement is secured.

A List of Gardeners on the Register will be supplied to employers only upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

Situations Wanted.

GARDENER (Head).—Advertiser seeks RE-ENGAGEMENT in first-class establishment, where several are employed; life experience, and thoroughly practical in all branches; five years as head in last situation; can be strongly recommended. Apply DUNKLEY, The Gardens, Mill House, Bourne End, Bucks.

HER GRACE THE DUCHESS of DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

GARDENER (Head of two or good Single-handed); good all-round experience with Vines, Cucumbers, Tomatoes, Fruit, Flowers, Lawns, and Vegetables; married, two children; excellent references. B. KILLINGWORTH, 15, Queen's Road, Upper Norwood, S.E.

GARDENER (Head Working).—Thorough practical experience in all branches of the profession, Inside and Outside; good references; married, no family. W. S., 16, Warwick Place, Maidstone, Kent.

GARDENER (Single-handed or Second) seeks SITUATION; nine years' experience; age 24; single; abstainer; good reference. Apply W. GRIFFITHS, Gardens, Bankhead, Broxton, Chester.

GARDENER (good Single-handed, with help), good all-round Man, in all branches, Inside and Out; would take moderate wage for a comfortable place; middle-aged; or would take a good jobbing situation; excellent testimonials from last and previous employers. F. OSBORNE, 48, Bradshaw Road, Watford.

GARDENER (Single-handed or otherwise), 12 years' experience, Inside and Out; good references; abstainer; single; age 30. H. DAVIS, 42, West Street, Lilley, Luton, Beds.

GARDENER (Single-handed or good Second), married; age 28; 10 years' experience in all branches; early and late forcing; willing to make himself generally useful; used to driving gas plant, etc.; can be highly recommended. A. BEACHER, 2, Church Lane, Warblington, Havant, Hants.

GARDENER (Single-handed) or Kitchen Garden, age 36, married, no family, wants Situation; life experience; good references. TURNER, 2, Trinity Place, Mile Town, Sheerness.

FOREMAN (Inside or Second), married; age 29; life experience in all branches; early and late forcing; good testimonials; can be highly recommended. GARDENER, Junction Road, Cowley, Oxford.

GARDENER, age 25, as FOREMAN, Inside and Out, or as Single-handed; good practical experience; excellent references past and present situations; married when suited. B. HARRIS, Canons Park Gardens, Edgware, Middlesex.

GARDENER seeks SITUATION, Second or First Journeyman; thoroughly experienced Inside and Out; height 5ft. 10in.; age 27; Single; 5 years' good reference last situation. Apply R. CLARK, Hasselor Hill, Alcester, R.S.O.

JOURNEYMAN (Inside and Out), age 21; three years' experience; well recommended. WM. C. FINNEY, 13, Rose Brae, Mossley Hill, Liverpool.

SMART YOUNG MAN (24) seeks SITUATION, private, under a good foreman; Inside and Out; 12 years' experience; 5 present situation, retail nursery; before private; used to growing a good collection of pot plants, cucumbers, tomatoes, etc., also kitchen garden; Bothy; disengaged when suited. A. E. TURNER, Benton Hall, Witham, Essex.

GARDEN LABOURER, married Man, requires SITUATION as above; aged 28; used to horses; can milk if required, and willing to make himself generally useful; good references. G. STEPHENS, 11, Dairsie Road, Well Hall, Eltham, Kent.

MANAGER wishes to recommend first-class CARPENTER, well up in Horticultural work; is also good Clerk and Typist. Apply Locksheath Nurseries, near Southampton.

YOUNG MAN, age 25, as SECOND or JOURNEYMAN under Foreman; 10 years' experience in all branches; good references. F. CORMELL, Mickleton, Campden, Glos.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

GARDENER (good Single-handed, with help), good all-round Man, in all branches. Inside and Out; would take moderate wage for a comfortable place; middle-aged; or would take a good jobbing situation; excellent testimonials from last and previous employers. F. OSBORNE, 48, Bradshaw Road, Watford.

GARDENER (Single-handed or good Second), married; age 28; 10 years' experience in all branches; early and late forcing; willing to make himself generally useful; used to driving gas plant, etc.; can be highly recommended. A. BEACHER, 2, Church Lane, Warblington, Havant, Hants.

GARDENER (Single-handed) seeks SITUATION in Kitchen Garden, Flower Garden, and Greenhouse; married, one child; age 35; left through no fault; good experience; excellent references. J. BURFITT, 9, Woodbridge Place, Guildford.

GARDENER (Single-handed) or Kitchen Garden, age 36, married, no family, wants Situation; life experience; good references. TURNER, 2, Trinity Place, Mile Town, Sheerness.

FOREMAN (Inside or Second), married; age 29; life experience in all branches; early and late forcing; good testimonials; can be highly recommended. GARDENER, Junction Road, Cowley, Oxford.

FOREMAN (Working): Grapes, Tomatoes, Cucumbers, Chrysanthemums, Pot Plants, Cut Flowers; Fern Raising a speciality; Forcing Bulbs, Valleys, etc., Wreath work. W., 71, Ditchling Road, Brighton.

FOREMAN (Inside), age 28; 13 years' good experience in Fruit, Plants, Carnations, Chrysanthemums, Decorations; good references; two years as Foreman. C. CHAPMAN, Sunnyside, Rotherfield, Sussex.

FOREMAN (Inside or General), age 28; single; 14 years' good experience Fruits, Plants, Table Decorations in good establishments; well recommended; disengaged. R. SCRIVEN, Alford, Castle Cary, Somerset.

GARDENER, age 25, as Foreman (Inside and Out), or as Single-handed; good practical experience; excellent references past and present situations; married when suited. B. HARRIS, Canons Park Gardens, Edgware, Mddlx.

GARDENER seeks SITUATION, Second or First Journeyman; thoroughly experienced Inside and Out; height 5ft. 10in.; age 27; Single; 5 years' good reference last situation. Apply R. CLARK, Hasseior Hill, Alcester, R.S.O.

GARDENER, age 30, Single, seeks SITUATION, Kitchen Garden and Pleasure Grounds; used to machines and scythe; 12 years' experience Inside and Out; abstainer; disengaged when suited; good references. H. DAVIS, 42, West Street, Lilley, Luton, Beds.

GARDENER (Under), age 25, seeks SITUATION in Kitchen Garden or Pleasure Grounds; 4 years' last situation; good references. O. PHILLIPS, Costessey, Norwich, Norfolk.

JOURNEYMAN (Inside and Out), age 21; three years' experience; well recommended. WM. C. FINNEY, 13, Rose Brae, Mossley Hill, Liverpool.

F. WESTRON, Rhinefield Gardens, Brockenhurst, will be pleased to recommend R. MIDDLETON, age 28, as GARDENER (Head of two or three); 12 years' experience Inside and Out in good places; married when suited; three years' reference from present place.

SMART YOUNG MAN (24) seeks SITUATION, private, under a good foreman; Inside and Out; 12 years' experience; 5 present situation, retail nursery; before private; used to growing a good collection of pot plants, cucumbers, tomatoes, etc., also kitchen garden; Bothy; disengaged when suited. A. E. TURNER, Benton Hall, Witham, Essex.

GARDEN LABOURER, married Man, requires SITUATION as above; aged 28; used to horses; can milk if required, and willing to make himself generally useful; good references. G. STEPHENS, 11, Dairsie Road, Well Hall, Eltham, Kent.

LADY BEAUMONT, Swannington House, Leicester, recommends J. CLARK to any Lady or Gentleman requiring an all-round GARDENER; life experience; married, no family. Apply J. CLARK, Bath Street, Ashby-de-la-Zouch.

WORK wanted by thoroughly experienced MAN in Lopping and Topping large or dangerous Trees, making them safe; by day or job; own risk; testimonials if required. GEORGE BANKS, 20, Caroline Road, Wimbledon, Surrey.

SITUATION COUPON

To the Advertisement Manager of "THE GARDENERS' MAGAZINE,
148 & 149, Aldersgate Street, London, E.C.

For JANUARY 15, 1910.

Please Repeat my Advertisement.

NEW
HARDY FOLIAGE TREE
FOR DELIVERY IN JUNE.
Catalpa Speciosa Pulverulenta.

This is a sport from the well-known Catalpa which blooms freely in this country.

This new variety is identical with its parent in all respects, except that it has **leaves wonderfully spotted with white**, producing an effect equal to that of a Caladium.

Grown under glass in pots and forced in a moderate temperature it makes a first rate decorative plant.

Out of doors it should be grown as a pollarded tree or bush, so as to produce larger and finer leaves.

It is one of the most original and striking forms of variegation which ever originated here (see figure in this journal.)

GOOD PLANTS IN POTS IN JUNE **5**/- EACH.
To be sent out with New Roses.

PEDIGREE SWEET PEAS.

THE GREAT SECRET OF SUCCESS IN GROWING SWEET PEAS:—BUY WELL-RIPENED ENGLISH GROWN SEED FROM VIGOROUS PEDIGREE STOCKS.

The Paradise Sweet Peas were the *only ones* which lived through last winter in an open field. The *only* open air Sweet Peas shown at the Temple Show, May 25th, 1909. The *only ones* in the country from which a good crop of sun-ripened seed was harvested in July and August before the disastrous weather set in.

The Paradise Sweet Peas are noted for high germination, vigour, and purity of stock.

Save your money & buy direct from the Raiser & Grower.

The following are a few of my famous varieties:—
Evelyn Hemus, A.M., R.H.S.; A.M., N.S.P.S.; F.C.C., Woodbridge, and Silver Medal for the Best Novelty of the Year 1908. Zarina F.C.C. York; A.M., R.A.S., 1909. Helio Paradise, F.C.C. York, 1909. Charles Hemus, A.M., R.A.S., 1909. Crimson Paradise. Paradise Ivory, A.M., N.S.P.S. Trials, 1908. Paradise Carmine, A.M., R.H.S. Paradise Constance Oliver. Paradise Elsie Herbert, &c., &c.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Seeds and Seed Orders.

The wealth of seed catalogues now placed at the disposal of the gardener, whether he be amateur or professional, should afford him some pleasure, not a little interest, and, it may be, cause considerable perplexity, the last named in, as a rule, inverse proportion to the amount of experience gained in garden management. Some of the catalogues that will come to hand will be quite simple, while others will be so luxurious in character as to possibly give rise to the feeling that they have reached a point beyond which it would be difficult to go. The cultivator, instead of troubling much about this matter, should at once give his attention to making a selection of the seeds that will be required during the year, and very carefully examine all the catalogues he has received previous to making a list of his requirements. We suggest the selection of seeds being made and sent on to the seedsmen as soon as convenient that there may be no delay when the proper time arrives for sowing the seeds, whether it be under glass or in the open. It would be well worth ordering flower and vegetable seeds early in the year for the purpose of relieving the strain that is imposed upon seed houses when the season is farther advanced, but ordering early is an essential point in good practice. The cultivator should, as a matter of course, select for the staple crops established varieties, that, as the result of experience, have been found well suited to the soil and climatic conditions of the district, and the requirements of the household. To the selection should be added a few of the more promising novelties, to be grown experimentally in small quantities. These will make the work of the garden more interesting, and serve a useful purpose, inasmuch as a comparative trial, conducted on proper lines, will enable the cultivator to determine whether or not he can improve his selection in the following year by the addition of varieties of recent introduction. It should be remembered that the improvement in the several classes of plants is still in progress, as the result of the activity of those in the seed trade, and the best kinds only should be grown. In comparative trials of new and old varieties the same course of procedure should be followed in the garden as at the experimental station, and this, briefly stated, is to grow all the varieties of any particular kind under precisely the same conditions. This should be self-evident, and in a large number of cases is carefully done; but we often find novelties growing under much more favourable conditions, and this fact, notwithstanding their being compared with staple varieties. There is a tendency that is very difficult to check, to bestow greater care in preparing the ground for, and making the sowing of, seed of an expensive variety than in dealing with seed of one that is obtainable at a cheap rate, and this is most marked, perhaps, in the case of peas. The proper course is to grow the novelties precisely the same as the staple crops. A detail of some importance is to clear out the seed cupboard before the order for seeds is executed, that there may be no risk of sowing old instead of new seeds. We suggest also that a time table for sowing be arranged, not to be slavishly adhered to irrespective of weather or the condition of the soil, but for general guidance. The value of such time table, used with due regard to weather conditions, will be great, as it will reduce the risk of the proper time of this or that crop being overlooked, and considerably reduce the strain upon the cultivator during the busy seasons. All seeds should be labelled when sown, and there will be a considerable saving of time presently if the labels are written now and put with the seed packets. The labels should be a historical record, and the best course of procedure is to write the name down the label from top to bottom; across the top should be drawn two parallel lines, on the top line write the name of the seedsman, and on the second line add in due course the date of sowing. It is also a good plan to keep a record in a notebook of the amount of seed sown and the resultant crops therefrom, so that the subsequent orders may be larger or smaller as may appear desirable from the record. It is most desirable the special predilections of the lady and gentleman of the house be carefully studied as far as space, time, and the upkeep of the garden and the supply of the kitchen will permit, and it is essential that gardeners should keep their employers interested in the garden and in their work. This may not in some instances be free from difficulty, but the endeavour will invariably meet with its reward, because when the employer takes an interest in the work that is in progress and the results obtained therefrom, he is the better able to understand the difficulties incidental to garden management, and be in a position to readily appreciate the value of both administrative ability and cultural skill. There is no occasion now to refer to the details essential to success in the raising of ornamental plants or useful crops from seeds, as our able contributors, in dealing with the several classes of subjects with which they have been entrusted, will give them due attention. One or two points of general application should be mentioned, and the first of these is the importance of not subjecting seedlings of hardy and half-hardy plants raised under glass to a temperature beyond that necessary to ensure the germination of the seeds and maintaining a steady growth. The other is to take advantage as far as practicable of a moderately dry state of the soil for sowing seeds in the open during the spring months, and where the soil is heavy and moist, to scatter a moderate quantity of fine soil over the surface of

MR. A. D. RICHARDSON,
Secretary of the Scottish Horticultural Association.

the beds or in the drills previous to sowing the seeds. When this is done the germination will be more even, and the growth more satisfactory than would otherwise be the case.

Mr. A. D. Richardson, whose portrait is given in this issue, has for so considerable a period been closely associated with the horticultural activities of Edinburgh, and accomplished so much useful work, that it is not surprising his friends should regard his assistance as essential to success in any movement that may have for its object the advancement of gardening in the widest acceptance of the term. On the retirement some years ago of Mr. Lindsay from the curatorship of the Edinburgh Botanic Gardens, he was appointed the head of the practical side of the work of the gardens, and in connection therewith he achieved much success. After occupying this position several years, he, evidently desiring a wider scope for the exercise of his abilities, retired from the Royal Botanic Gardens, and engaged in the profession of landscape gardener, and, it would appear, has made rapid progress therein. A short time after Mr. Richardson had entered on his new sphere of activities the secretaryship of the Scottish Horticultural Association became vacant; the council at once invited him to fill the vacancy, and this invitation he accepted. This association has from the first been especially fortunate in its secretaries, and while the services of the horticulturists who have filled the post of secretary are remembered with gratitude by those who have been acquainted with the association from its earliest days, they are ever ready to acknowledge the great ability with which Mr. Richardson discharges what, having regard to the large number of members, and the holding of meetings throughout the year, may well be described as his onerous duties.

The Gardeners' Magazine Almanack.—The Almanack which we have the pleasure of presenting with this issue will be found of much value for the information it contains relating to the numerous meetings that have been arranged for the current year. It will be of interest also for the admirable illustration of two varieties of the sweet pea, which is now so deservedly popular in the gardens of all classes. The varieties illustrated are typical of the many beautiful forms now in cultivation, and their selection for the Almanack may be safely regarded as evidence that these fragrant flowers will receive a full share of attention in these pages during the year on which we have entered. As a further proof we would mention that we shall devote our issue for January 22, chiefly to sweet peas, and, with the co-operation of the leading experts, shall in a series of illustrated articles give full information on matters that will engage the cultivator's attention for some time hence With that issue we shall also give a finely-executed coloured plate depicting one of the finest of the sweet peas of recent introduction.

Southern Spring Shows.—Among the many spring shows to be held in the South of England this spring the chief are: Torquay, March 17; Cornwall Daffodil Show at Truro, April 12 and 13; Devon Daffodil Show at Barnstaple, April 19 and 20; Falmouth, April 21 and 22; Exeter Daffodil Show, April 22; Devon County Show, at Exeter, May 13, 14, and 15; and Bath and West and Southern Counties Show, at Rochester and Chatham, on May 24 to May 28.

Christmas Trees in Germany.—With reference to the popularity of the Christmas tree among the German people, Consul Dunlap, writing from Cologne, expresses the opinion that it is safe to say that of the 6,000,000 families in the German Empire, 5,500,000 purchase a tree. He then proceeds to say that, as a rule these evergreens are spruce, which grow in all sections of the empire. The planting as well as the cutting of trees is all under control of the Government officials, and it may be said without fear of contradiction that there is not now an evergreen growing in Germany that was not artificially planted. In the initial stage the young plants are set in rows about four feet apart with the plants one foot apart in the row. As the trees develop they are gradually thinned. When one foot high many are transplanted into pots and form miniature Christmas trees. The great mass of trees offered for sale are from two to ten feet high, the medium being used most, and cost retail from eightpence to two shillings each, the average price being about eighteenpence. Thus a very large sum is annually expended by the German people in the purchase of Christmas trees, a point of considerable practical importance, as thereby a large part of the earlier thinnings of the woods devoted to spruce is disposed of with profit.

Fancy Perpetual-flowering Carnations.—Although the perpetual-flowering carnations with self-coloured flowers are the most useful for decorative purposes generally, the fancy varieties of high quality are of considerable value for giving interest to the collection and for bouquets, and for vases in the drawing-room. The number of fancy varieties in this section is as yet small, hence the introduction of so promising a variety as the crimson-flaked Emperor, illustrated on page 29, which has been introduced by Mr. H. Lancashire, Victoria Vineries, Guernsey, is a matter of considerable interest.

Dunfermline Horticultural Society.—This society has evidently had its lines cast in pleasant places, and certainly the executive has had good cause to congratulate itself in being able to fall back upon the Carnegie Dunfermline Trust in the endeavour to maintain a balance between the income and expenditure. The society held two excellent exhibitions during the year at a total cost of £283, and of this the sum of £150 was disbursed in prizes. The total income was £120, leaving a balance of £162 17s. 5d., which was contributed by the Trust. We believe this body subscribes thus liberally to the funds of the society on condition that the charge for admission is almost nominal, for the purpose of enabling the poorer residents to visit the shows. The annual meeting was held a few days since, when the report and financial statement were passed, the silver medals awarded at last year's exhibitions handed to the winners, and Mr. James Dunagan elected president, Mr. T. Kilgour treasurer, and Mr. J. Hynd secretary.

Trial of New Roses at Bagatelle.—For several years past trials of new roses have been conducted at Bagatelle on somewhat new lines, and have on the whole proved satisfactory. It has been a condition that the varieties submitted for trial should be grown for two years to give the members of the jury an opportunity of becoming well acquainted with their characteristic merits before making their awards. With reference to the conditions under which the roses sent for trial are received, M. Forestier, who has charge of the arrangements, informs us that the plants must have been grown in pots, and that several examples of each must be sent, five being the minimum number. They must reach the Bagatelle rosery before April 15, and be accompanied by the names of the senders, particulars as to their parentage where known, and the names of the varieties. The roses will be planted in beds out of doors when they are received at Bagatelle, and remain in them until the month of October of the year following. In case any of our readers may wish to send new roses for trial, we would add, the packages should be addressed as follows: M. le Conservateur des Promenades, Roseraie de Bagatelle, Abbaye de Lonchamp, Bois de Boulogne, par Neuilly-sur-Seine.

Flowering of Cycas circinalis.—The flowering of the finely grown specimen of this handsome cycad in the gardens of Balruddery, Dundee, the residence of J. M. White, Esq., has attracted much attention in the district. This is not altogether surprising, for the specimen is in so high a state of development as to represent cultural skill of a high order on the part of Mr. G. Davie, the head gardener, and this is the first time it has bloomed in the collection.

The Welwitschia at Home.—In his account of the Percy Sladen Memorial expedition in South-West Africa, contributed to "Nature," Professor H. H. W. Pearson makes the following reference to the Welwitschia, one of the most remarkable of plants. "Welwitschia plants were found in abundance about forty miles to the south of Mossamedes in the direction of Cape Negro, the locality in which it was discovered by Welwitsch. The plants had coned freely, but almost without exception the cones, severely attacked by a fungus (probably a Cladosporium), were in a state of decomposition—no doubt another consequence of the excessive atmospheric humidity earlier in the season. A large number of young seedlings were found. The Damaraland localities previously referred to, in which no Welwitschia seedlings have been found within recent years, are about forty miles from the sea. But even in these southern latitudes normal seed-reproduction seems to occur on the coast. It is not improbable that a condition of its seed-germination in nature is a degree of atmospheric humidity which is constantly realised near the sea, though now usually absent from desert places inland."

Bacteriology.—In the course of an address delivered by Professor McKendrick, F.R.S., at Glasgow, he said that in the public mind there is a widespread impression that bacteria and other organisms are the enemies of man, but this is far from being the case with the great majority of these humble plants. Of the thousand or fifteen hundred species now known, probably only fifty or so are inimical to man. The others are highly beneficent. Some are engaged in taking nitrogen from the air for the use of the higher plants: others in splitting up complex substances existing in the bodies of dead plants and of dead animals, and in restoring simpler substances to the soil; others purify our rivers and lakes; even the ocean is the theatre of their activities; and others have to do with the varied phenomena of fermentation. A knowledge of the life-history of these microbes has enabled the physician and surgeon not only to do much in the way of preventive medicine, but to benefit mankind in the treatment of many diseases; and, what is probably of even greater interest, we now recognise that the rôle played by these organisms is of the greatest importance in many industries.

Horticulture at the Brussels Exhibition.—Three competitive horticultural exhibitions will be held in conjunction with the Brussels International Exhibition next year. The first of these will be held from April 30 to May 3, and is for hardy and tender plants, forced fruits and vegetables, and floral decorations. The second show will be held from September 24 to 27, and the subjects invited are fruit and the products of market gardens. Chrysanthemums and fruit are specially invited to the third of the shows, which will be held from October 29 to November 2. Schedules and entrance forms may be obtained on application to the secretary of the Horticultural Committee, 8, Whitehall Place, S.W.

Manuring of Pasture Land.—A few years since Lord Londonderry placed thirty-one acres of poor pasture land on his Wynyard Park estate at the disposal of the Armstrong College of Agriculture for experimental purposes. Some part of the land is a poor, shallow clay resting on boulder clay, the other being rather light and sandy. One acre of the land was marked off as a control plot and the remainder of the land was dressed with basic slag at the rate of 10 cwt. to the acre. Ten acres of the dressed land received in addition an application of muriate of potash at the rate of 2 cwt. per acre. The effect of the manures was soon apparent, and now the herbage is so far superior that it is able to maintain quite double the number of cattle. The muriate of potash had no appreciable effect on the clay soil and but little on that of a light character. The beneficial effects of the basic slag was so marked at the end of the first year that eighty-seven acres on another part of the Wynyard Park estate were similarly dressed, and here also the application has proved highly beneficial. In both cases the growth of red and white clover has been greatly stimulated, with advantage to the food value of the herbage.

The Soy Bean Industry is becoming a very important one, owing to the value of the beans (Glycine hispida) for cattle feeding purposes. The bulk of the beans imported come through the ports of Dalny, Vladisvostock, and Newchwang, from Manchuria. The "Journal" of the Board of Agriculture points out that the total production of beans in Southern Manchuria, which is served by the ports of Dalny and Newchwang, is stated to have been 580,000 tons in 1907, and 830,000 tons in 1908, while in Northern Manchuria the Vice-Consul reports that the crop in 1908 probably amounted to 900,000 tons, and the prospects for the crop in 1909 indicate a yield larger possibly by twenty per cent. The beans from Northern Manchuria come through Vladivostock. The price in London in November last was reported to be about £7 10s. a ton.

Falmouth Spring Show.—Under the auspices of the Town Development Committee of the Falmouth Chamber of Commerce a spring flower show will be held in the Gyllyngdune Gardens of that famous Southern town on April 21 and 22. The dates originally fixed were April 26 and 27, but the alteration is likely to improve the show, as we understand that Her Royal Highness Princess Christian has consented to pay a special visit to Falmouth to open the show on April 21. An excellent schedule has been arranged, and valuable prizes are offered for daffodils, flowering trees and shrubs, rhododendrons, camellias, violets, polyanthuses, etc. The hon. secretary, from whom schedules can be obtained, is Mr. R. E. Gill, 14, Market Place, Falmouth.

WINTER SPRAYING.—No. I.

Among the many progressive movements which have stirred the gardening world during the past few years none has made more rapid progress than "winter spraying." Years ago it was considered a very good plan to thoroughly wash the stems of trees with hot lime, and also, in the case of bush fruit, to scatter freshly slaked lime on the trees when wet with dew or mist. But beyond this nothing was ever done to cleanse the trees in winter.

Less than ten years ago the use of the caustic alkali wash first became general among progressive growers, and it is only during the last three years that so much attention has been bestowed upon the subject by the Gardening Press, manufacturing chemists, and the majority of fruit growers, both private and trade. Doubtless the two former classes have served to stimulate the latter, for many patent spray fluids have been much advertised and written about until one has gained the impression that such and such a spray has only to be used and all the fruit grower's troubles with regard to pests will be at an end.

Such was the position in the winter of 1907 and the spring of 1908. The grower was given to understand that these spray fluids, if properly used, would corrode the eggs of the Apple Sucker and the various caterpillars, as well as destroy the hibernating spores of apple scab fungus. Many gardeners and fruit growers used these remedies, many of them winter spraying for the first time, and with most conflicting results. Where the work was properly carried out the mosses and lichens were killed and the trees had a thorough clean up, but only in a few cases were the various eggs destroyed. Indeed, many fruit growers, in the Evesham district particularly, who had abandoned grease banding because of the supposed efficacy of winter spraying had a terrible infestation of Winter Moth caterpillar, so severe in cases that the trees were completely defoliated.

Naturally, this gave a setback to the practice, and in the winter of 1908 and the following spring considerably less winter spraying was done than in the previous season. There is, however, no need to drop winter spraying, as it accomplishes a great deal of good, providing too much is not expected of it. Much of the misunderstanding which arose about the Apple Sucker eggs proceeded from the fact, which has since been discovered, that the vitality of the eggs is considerably affected by the severance of the twig or bough from the tree, so that if the portion of wood is kept for any length of time, the eggs failed to hatch out, a desirable result which was placed to the credit of the particular spray employed, whereas it was really because of the severance of the piece from the tree. It scarcely seems possible that anything will ever be discovered which will be strong enough to act upon the eggs and destroy them, and yet do no harm to the tree. Indeed, with the caustic soda wash, it is distinctly unwise to winter spray year after year without a break as there is a great danger of injuring the bark, making it spongy and giving to it a most unhealthy appearance. Such an undesirable result would be even more likely if the spray fluid used contained paraffin.

There is not, however, generally any need to repeat the operation for a year or so when using one of the paraffin winter washes, as the mosses do not seem to grow again quite so quickly after this spray as after the caustic soda. It is very efficacious in cases where there is much American Blight, for paraffin in some form or other is a sovereign remedy for this pest. Considerable force must be used when trying to eradicate this foe, as it is nearly always entrenched in cracks and crevices in the bark which an ordinary washing would not penetrate, and it is also covered with a kind of down which helps to shelter it from the spray, unless it be a very fine and powerful one.

The principal effect we must look for from winter-spraying is undoubtedly the destruction of the mosses and the lichens on the tree, so giving it a clean, healthy appearance. The cleansing, however, is only a part of the benefit which is accomplished, for the destruction of the moss removes the hiding-places of the hibernating insects, particularly the Apple Blossom Weevil, as well as affording less lodgment on the tree for any spores of fungi. This treatment manifestly places such hibernating insects at a great disadvantage, and must in the end tend to reduce their numbers considerably. If the spraying is thoroughly carried out and a good dose of the fluid given that most troublesome pest the Mussel Scale will be generally killed, though in very bad cases, so thick is the layer of scales, a second spraying may need to be given ere a clean sweep be made of it.

The circular scale which is to be found on gooseberries and currants can also be killed by winter washing with any of the well-known fluids, if the extent of the attack should warrant it. As I said before, the spray used should be a powerful one, and with great penetration, with greater force than the mist spray which is needed for use with poison washes, and not so coarse as that needed when large quantities of aphis wash are being used. It is a very difficult matter to use force enough to obtain the requisite amount of penetration while not wasting too much material, because of the large pressure throwing the material through and beyond the tree, particularly in the case of big trees where the nozzle has to be held at a considerable distance from the part being sprayed. Indeed, this latter seems to point the most likely method of getting over the difficulty, i.e., by the use of long lances to be able to get the nozzle close to the portion being sprayed so that we may use one giving a high velocity at the orifice with a comparatively short range of throw.

The amount of liquid wasted when some precaution is not taken is very serious indeed, particularly where an expensive fluid is being used, but it cannot be avoided where a fire engine sort of tackle is employed, for the amount of surface of wood in the tree is in very small proportion to the total area of space between the branches, consequently much of the fluid thrown passes through when there are no leaves to assist in stopping it. Unfortunately, with such a spray as I have described, the influence of the wind is rather serious, it being very difficult indeed to drive the fluid against a strong wind. Consequently only one-half or two-thirds of the tree (that to the windward) can be done, the other being left for a change in the direction of the wind.

Naturally, seeing that all these various fluids and washes are required for the purpose of burning away all rubbish on the tree, they are liable to injure the face, hands, and clothes of the operator, which should be protected as far as possible. A sou'-wester hat, a smock, and a pair of stout leather gloves, should serve to form an adequate protection for anyone who is moderately careful. Rubber gloves are sometimes used, but they are open to the objection that they seldom fit at all tightly at the wrist.

Frank Hammond.

Pilgrim's Hatch.

SCREENS FOR HERBACEOUS BORDERS.

In preparing and planting a herbaceous border the difficulty sometimes arises in finding a suitable background for shelter, as a screen from other parts of the garden, or for some other purpose. When a herbaceous border is made in front of a hedge, wall, or shrubbery, such difficulties do not occur, but in the open the circumstances are different. An opportunity then is afforded to erect a fence of wire with iron standards, or it can be made with larch poles or peeled oak boughs, with a view of giving it a rustic character.

If the screen is made of wire stretched horizontally to stout iron standards, and the corner straining posts made firm in the ground with concrete, such a screen will last many years, especially if it receives a coat of dull-coloured paint occasionally. In any case it should not be less than twelve feet high, two feet more would be better, producing a more satisfactory effect and admitting of bolder plants to be grown. Circumstances will, of course, govern this detail. If the border is to be narrow—say, six feet to eight feet, then the screen should be in accordance. Where the border is, say, ten to twelve feet wide, then the figures given at first will be appropriate. Such a screen as this provides ample opportunity for a great variety of plants remarkable for foliage and flower, and for all seasons alike, and cannot fail to be an interesting portion of the garden.

In planting the herbaceous subjects, some discretion should be used in not putting them nearer than three feet from the screen, except in the case of bulbous subjects of low growth. Those utilised for spring decoration before the regular occupants of the border reach a third of their normal height, will form an interesting feature. This space of a yard or so will allow opportunity for passing along at the back of the border and attending to the roots of the climbing plants as well as their branches, and certainly the former will need frequently some manurial assistance, water during a spell of dry weather, and so forth.

The choosing of subjects for planting in such a position affords a wide scope for variety. As a guide to intending planters I will give a list of suitable subjects for spring, summer, autumn, and winter, including in each division both flowering and foliage plants.

Spring-flowering: Clematis montana, Akebia quinata, Berberis stenophylla, Honeysuckle Early Dutch, Pyrus japonica, Forsythia suspensa, Wistaria sinensis, laburnums, Philadelphus Gordonianus. The same foliage plants I shall name for winter will be applicable for the spring.

Summer-flowering subjects: Ceanothus azureus, C. Gloire de Versailles, C. Veitchianus, Escallonia macrantha, E. phillipense, Jasminum officinale major, Passiflora Constance Elliott, Polygonum Baldschuanicum, Carpenteria californica, Choisya ternata, Fabiana imbricata, Romneya Coulteri, Clematis Belle of Woking, blue mauve; Countess of Lovelace, blue lilac; Venus Victrix, delicate lavender; Duchess of Edinburgh, pure white; and J. C. Veitch, light blue. Roses of approved forms will come into this section, none but those naturally adapted for such a purpose by their trailing habit of growth should be planted. Many of the so-called climbing H.T.'s are much too thin in their growth to be classed as climbing subjects. Dorothy Perkins, Lady Gay, Claire Jacquier, Brunonis, Crimson Rambler, Euphrosyne, Felicite Perpetue, Mdme. Alfred Carriere, Paul's Carmine Pillar, Psyche, Rubin, Una, and The Garland are admirably suited for the purpose in view.

For foliage: Aristolochia sipho, Vitis (vines) purpurea, Humulus lupulus foliis aurea (Golden Hop).

Autumn-flowering subjects: Clematis Jackmani, purple; C. j. alba, white; C. flammula, white, sweet-scented; C. Mdme. Grange, crimson violet; C. rubella, rich claret-purple; Victoria, deep red-mauve; Beauty of Worcester, blue-violet; Henryi, cream-white; Louis van Houtte, blue-purple; and Regina, lavender-blue. Autumn-flowering roses are worthy of attention. Gardenia, yellow, changing to white; Rose Transon, rose; Paul's Single White, and Aimée Vibert, Bignonia grandiflora rubra, honeysuckles, Late Dutch, Halliana, flexuosum and aurea reticulata, Solanum jasminoides, Buddleia variabilis Veitchi, Cotoneaster Simmondsi, C. microphylla, Tamarix hispida æstivalis, Abelia rupestris, Exochorda grandiflora, Fuchsia Ricartoni, and Spiræa Lindleyana.

The autumn is rich in subjects grown for foliage alone; these make a charming addition to any garden. The following are desirable: Actinidia arguta, Ampelopsis Ledeiacea, A. Veitchi, Vitis Coignetæ, V. dissecta, V. Thunbergi, and V. Brandt.

Winter-flowering climbers naturally are scarce, the best being Jasminum nudiflorum, and Garrya elliptica, with the Fire Thorn, Cratægus pyracantha, and C. p. Lelandi.

E. Molyneux.

PERPETUAL CARNATIONS FOR PRIVATE GARDENS.

In selecting the best perpetual carnations for private gardens I put quality of flower first. I also keep in mind the essentials of a sound constitution, correct shade of colour, scent, etc., whilst the age of a variety does not influence my selection.

Reds or Scarlets.

Britannia will be generally conceded to be the best red variety. Its only shortcomings are lack of scent and slow growth in the winter. The latter weakness is overcome by not growing this variety in too large a pot. Let the plants be well root-bound by August, and do not stop them after mid-June. Britannia should always be cultivated under glass protection during the summer. If this is done it will be found proof against disease.

O. P. Bassett, the new American scarlet, is a most excellent second. It has very large fimbriated flowers of good colour and scent, good stem and calyx, and strong, healthy habit of growth.

Beacon is the freest-flowering scarlet variety. The flowers are a little undersized, and inclined to come a poor shade of colour in midwinter; yet it is, perhaps, the best market variety.

Victory is prone to disease, whilst Robert Craig is far too shy a bloomer.

There are other red varieties, but none of them are worthy of our consideration.

Whites.

White Perfection produces the purest flowers with the most refined appearance, always surpassing its contemporaries at the shows. This variety should be propagated before March, and given special care in the early summer in the matter of air and potting, so as to obtain a strong, vigorous plant. If this variety is not well grown it is practically useless.

White Enchantress. I allude exclusively here to the pure white stock. This is the freest-flowering white, and the best for market growers. It should be grown in a good, light greenhouse, with a low temperature.

Sarah A. Hill is undoubtedly a most excellent variety, which has been overlooked by many. The flowers are very large, pure in colour, with a rich old-clove scent. The habit of growth is always healthy and free, and much superior to the average American variety for pot cultivation.

Mrs. J. C. Vaughan is one of last year's American novelties which has failed over here.

Crimsons and Maroons.

Black Chief will easily lead the other varieties, mainly owing to its strong, free habit of growth, which appears almost proof against disease. The flowers are of medium size, and possess a strong old-clove scent. It is best grown out of doors in the summer, and not stopped after early in June. Like Britannia, it prefers a small pot to flower in.

Harlowarden is a bad second, owing to its weak habit and poorly-built flowers.

Other crimson varieties, which have been tried and found wanting, are: Havard, far too shy in flowering; The President, requires more sun in winter than we can give; Harry Fenn also fails in mid-winter; Wanoka, an American novelty, is a complete failure; Ruby, yet another American candidate, may improve, but as yet it is poor in colour and inclined to split its calyx.

Pinks.

Enchantress leads in the flesh-pink shade and is too well known to call for comment; yet it is most essential that only good cuttings from healthy parents should be propagated, and so preserve the true type.

Mr. Charles Knopf is a new variety in the same class of colour, only quite a shade darker. The flowers are also larger in size. In short, it is a glorified Enchantress which has a future before it. It has been considerably over-propagated in America, and is at present suffering from the effect.

May Day is the best and freest-flowering variety in the salmon-pink shade. The blooms are not large, but almost perfect in form. It makes a very compact, bushy plant, and has a wonderfully healthy growth.

Delight is a salmon-pink, very similar in form of flower and habit of growth to White Perfection, to which it is closely allied.

Mrs. Burnett has made many friends, but its poor constitution has outvied the other good qualities.

Afterglow has quite superseded Mrs. T. W. Lawson and all other varieties in the cerise-pink shade. The habit is very strong and healthy, the flowers are of good size with evenly-formed fimbriated petals, whilst its stem and calyx are most reliable. The colour is a decided improvement upon its predecessors, being free from any magenta shades.

Rose-pink Enchantress is the best rose-pink variety for private growers, provided the true stock is procured. It is larger in size than Winsor, has a better stem, and grows much easier than many other varieties.

Fancy Varieties.

Rose Dore.—A novelty of the salmon-red shade, with Rival as its only serious contemporary. The former produces slightly larger flowers, whilst the latter will excel in quantity. One or the other of these varieties should be in every collection.

Jessica is, perhaps, the leading variety of the white-pencilled-scarlet class. The flowers are very large and bold in appearance.

Such varieties as Royal Purple (purple), Mikado (heliotrope), Helen M. Gould (pink, pencilled, and spotted rose-pink), are purely a matter of taste. We also wait for a truly good yellow perpetual variety.

Montagu C. Allwood.

THE FUTURE OF SINGLE CHRYSANTHEMUMS.

Just at the present moment when the season of the chrysanthemum is practically over, the question arises as to the future of the various types of the Autumn Queen. Realising that the large Japanese, incurved, and other double-flowered types may enjoy many years of fair prosperity, I would fain remind readers that in the rapidly rising single-flowered section we have a type that will speedily attain to a dominant position in the floral world.

Although many may regard my statements as rank heresy, I cannot regard the giant specimen, mop-headed, show chrysanthemums with any kindly feeling. Acknowledging that they represent the skill of the raiser, and the care of the grower in no uncertain degree, yet to my mind, for sheer beauty of formation and picturesque effect they cannot for one moment compare with the simplicity of the better single-flowered varieties.

For conservatory decoration, for cutting for the boudoir, or for the table, the simple blossoms of the single forms are of exceeding value. The future of the chrysanthemum lies largely with them, and certainly no garden should be without a small collection of the finer forms. At the majority of the exhibitions the singles occupy as yet a secondary or even lower position. They are not to be ranked with their wondrous brethren of massive proportions, though for the matter of that, they are gradually winning their way to a front rank position.

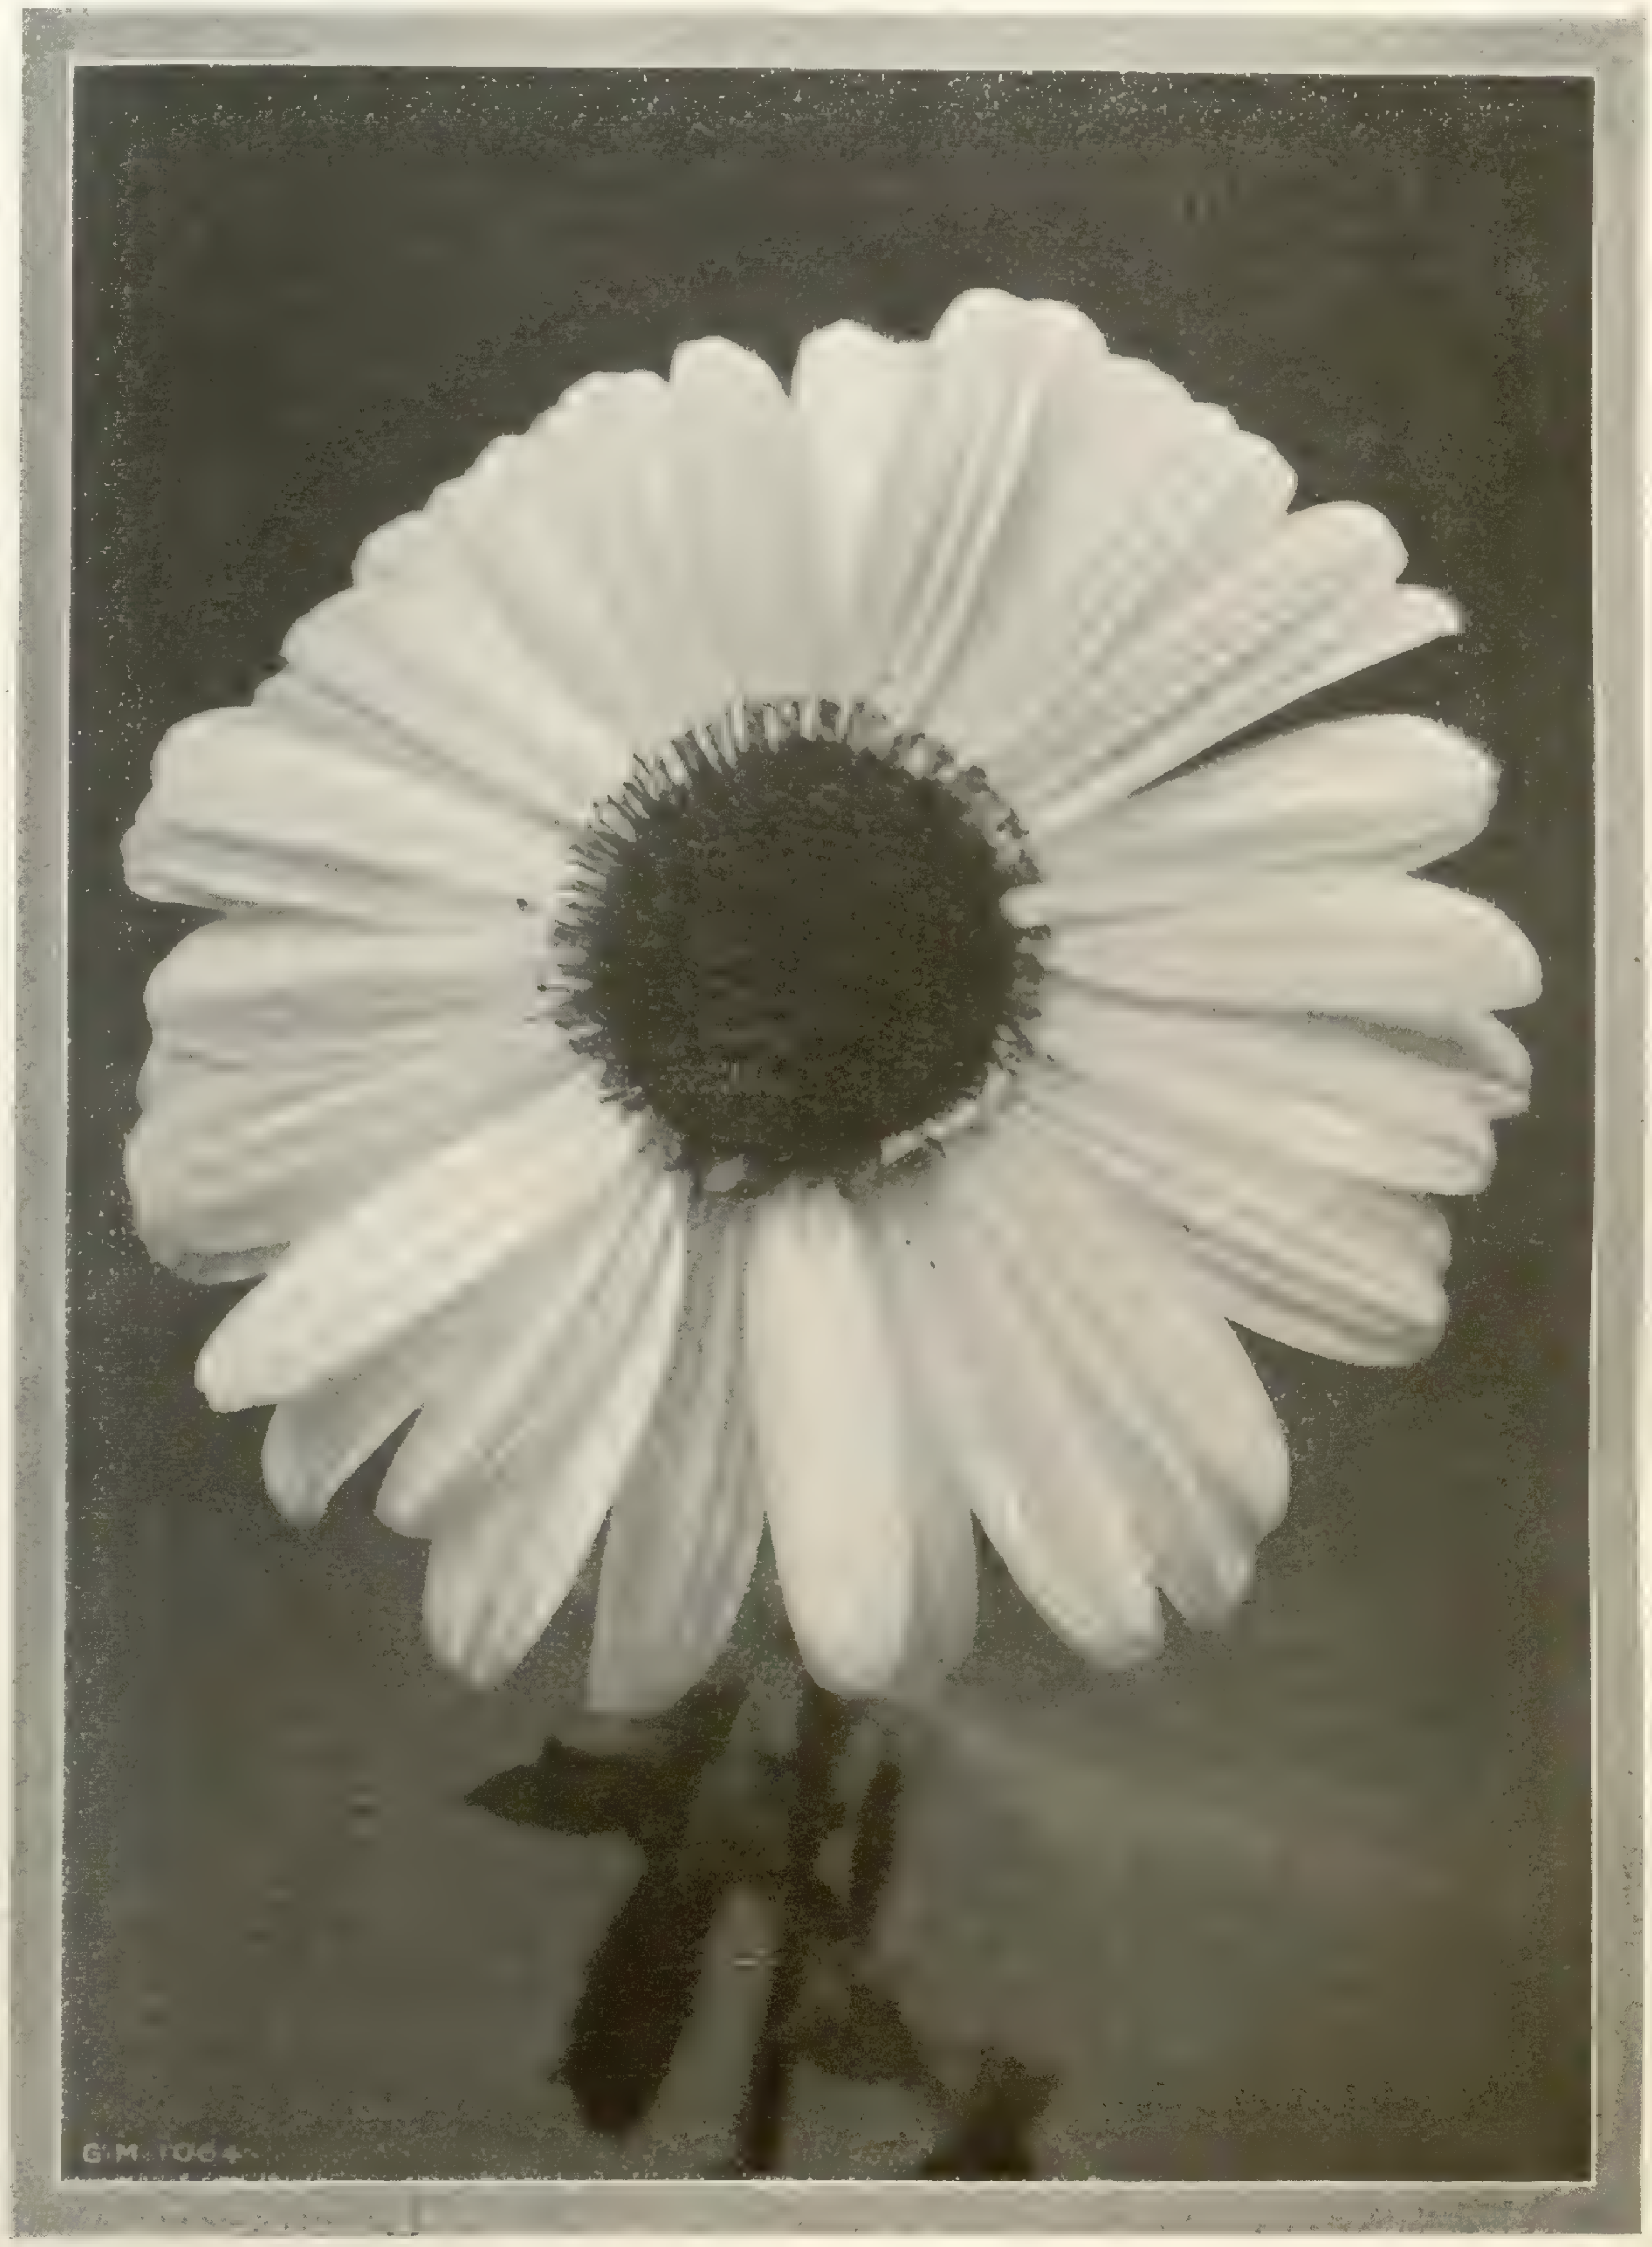
One surety of the future of the single chrysanthemums is the appreciation of the gentler sex, and where the ladies can admire and find beauty, it is of little avail for the rigid floriculturist to stem the tide of popular appreciation. The lightness, daintiness, and symmetry of these blossoms together with their freedom and good range of colouring, will appeal to the flower-lover, and the result will be an ever-extending reign of the single chrysanthemums. Take, for example, the pictured beauty of Mensa as a case in point, or such a glorious variety as Altrincham Yellow, with its appealing charm, and any uncertainty which may be in your mind concerning the future of the group should speedily vanish.

Again, the value of Mary Anderson, Edith Pagram, and their respective sports is too well known to need repetition, while the fine and extensive range of noteworthy varieties leaves nothing to be desired as far as colouring is concerned. There are good whites, yellows, bronzes, pinks, and crimson hues, in profusion, to say nothing of the indescribable wealth of intermediate shades, which combine to give us fine material for decorative purposes. There is a wonderful diversity in the way of petal formation, many types being met with in a representative collection, and this same diversity will make work for the selectors, when the day comes (as it surely will) for the standardisation of form in the single chrysanthemums.

As in all florist's flowers there will be definite rules laid down regarding the form of the blossoms, and future varieties will have to be judged by the standard fixed, thus settling their fitness or unfitness by a fixed decree. Apart from this, the single chrysanthemum is going to have a good future as a popular market flower. The light, graceful forms, the clear colourings, and their ease of arrangement, will all tell in favour of our subjects, and these, together with a wise selection in choosing varieties which will travel well, will do much to hasten their hour of popularity.

By fixing a standard of form as soon as possible, the officials of the N.C.S. will do much to advance the cause of the single chrysanthemums, and will thereby gain the thanks of the flower-loving community.

P. S. Hayward.



NEW SINGLE CHRYSANTHEMUM MENSA.
A beautiful white variety. A.M., R.H.S., Mr. H. J. Jones, November 23, 1909.

CENTROPOGON LUCYANUS.

There seems to be a certain amount of doubt as to the origin of this plant, but there can be no question that it is a very desirable winter-flowering subject for a structure where an intermediate temperature can be maintained. It is a soft-wooded plant of a sub-shrubby character, clothed with oblong lanceolate leaves of a bright green colour. The flowers, borne in loose clusters at the points of the shoots, are curved, tubular in shape, and of a bright carmine colour. Given favourable conditions, they are borne from autumn to spring, and, of course, are then much appreciated.

When grown as a bush it should be secured, but not too stiffly, to a central stake. The weight of the flowers will cause the branches to assume a gracefully arching character, and treated in this way a very pleasing specimen is the result. Beside this it is well adapted for growing in suspended baskets, the clusters of blossom having a very pretty effect when viewed from below. This centropogon can be readily struck from cuttings of the young growing shoots in the spring, but it is not a vigorous rooting subject, hence overpotting must be guarded against. It thrives best with a liberal amount of leaf-mould in the potting compost. Though different authorities are not all of one accord as to the exact origin of this centropogon, it is stated in the "Dictionary of Gardening" to be a garden hybrid raised by M. Desponds, of Marseilles, in 1856. It is a plant that can be readily obtained from the nurseries.

K.

Trenching and Manuring.—Deep cultivation should always be resorted to as far as possible, as it warms and drains the soil in wet seasons. Besides this, it brings a good depth of soil quickly into a high state of fertility. Some crops will assimilate more manure than others, therefore these must be added with discretion according to the prospective crop. Long stable manure and tree leaves form excellent material for the bottom trench, adding partly decayed farmyard manure beneath the top spit.—G. E.

A YEAR'S SUPPLY OF "GREEN VEGETABLES."

At this particular season of the year the gardener is inundated with attractive seed lists, all setting forth in persuasive language the merits of recognised types and newer forms of the great cabbage family, and he will soon be busy making up his mind what kinds and varieties are to be his sheet anchors for the year's supply. Most growers like to make their selections of seeds early in the new year, therefore the earlier noteworthy types are brought to their notice the better, and especially so when the seed supplies are limited. A month or so ago when looking over an extraordinary and educative exhibit of brassicas, staged by Messrs. Sutton and Sons at the Horticultural Hall, Vincent Square, I was greatly impressed with the national importance of the cabbage as a food plant. The many distinct forms evolved from the common type now supply us with green vegetables the whole year through, and so careful have our raisers and selectors been that the majority of the varieties may be relied upon to produce themselves true to character.

From the time when the first dainty cabbage in the early spring is ready to be severed from its stem, we have a continual supply of green vegetables, with distinctive taste, hardiness, and other important characters. At the present time, too, we have in several instances combined features upon the same stem, as in the many-headed or sprouting broccolis of general utility, while in years to come the sprouting savoy, with its crumpled leaves, and the headed cabbage, with sprouts and smooth leaves, will probably become universal favourites.

In restricted gardens it is important that the grower chooses only those green vegetables which, with proper treatment, will yield sure returns in their seasons. There are many cultural points to be thought out in connection with a year's supply of green vegetables, and, like many other details in connection with the management of a garden, the preparation of the soil, the sowing of the seed, and, in some cases, the pricking off of the young plants before finally transplanting them, have all a bearing upon the ultimate results. As the length of time required for each crop varies very much, definite knowledge is necessary, and while some cannot be grown too quickly others must only advance to a given point at certain seasons or disappointment will follow.

Succulent cabbages cannot be grown upon a poor diet, yet the feeding must be correct. Should it be given to autumn plantations intended for the spring crop the growth may be too "proud" during the autumn and early winter; but it is not the largest and softest specimens that mature the earliest in the following spring, but those with a hardened tissue and good root hold. These latter will respond to spring forcing when the time comes for it, without bolting. Whether the stimulants, like nitrate of soda or sulphate of ammonia are given in February or March depends upon the season, the point is that before the applications are made the plants should have assumed the hearting attitude, then succulent material is quickly formed.

For August or late July sowings of the smaller forms, Sutton's April, Veitch's Market Garden, Ellam's Early, and Early Offenham are very good. Flower of Spring, Webb's Emperor, and Wheeler's Imperial are all good to follow these. For sowing in the spring, to mature quickly, there are such excellent varieties as Veitch's Earliest of All, Sutton's Earliest, and Carter's Early Heartwell, and those of larger size, and later in maturing, like Winningstadt, Enfield Market, and Maincrop. Little Gem and Christmas Drumhead are valuable for late autumn, and remain in good condition after others have rotted. Little Gem may be sown with the Hardy Green and Rosette Coleworts.

Perhaps the cauliflower is the choicest of all this family, and it must be liberally treated if good heads are to result, because these are only produced in perfection when sufficient leafy growth is made to protect their flower head. The frame or early maturing varieties, such as First Crop and Early Dwarf Forcing are best sown at the turn of the year and grown steadily in a little warmth, then, if carefully hardened before being planted out in a rich soil and a warm position, they will be early and useful. Snowball, Magnum Bonum, and Early London, from autumn-raised seedlings, follow the small type successionally, and other fine varieties are Veitch's Pearl, Sutton's Purity, White Queen, and Carter's Early Emperor, Early Giant, Extra Early Autumn Giant, Autumn Mammoth, and that grand and veteran variety Veitch's Autumn Giant. Those named are the cream from which a good selection may be made.

The Brussels sprouts, being tolerably hardy, are important from the time of the first autumn frost until the secondary and tender shoots formed in the spring are exhausted. A long season for growth upon firm ground, with full exposure to air gives the most satisfaction to the grower. All the leading seed firms have good strains of Brussels sprouts, and the variety known as Exhibition is the best for the earliest supplies; Carter's Perfection, Sutton's Matchless, and Veitch's Market Favourite, are also fine cropping varieties, but one of the most serviceable for private gardens is Dwarf Gem. If very large sprouts are desired Cambridgeshire Champion, The Aigburth, or Scrymgers Giant will, with proper cultivation, provide them.

The broccoli is one of our most uncertain crops, and the continuation of supplies from October to June largely depend upon the weather, however, provisions for a succession must always be made, and in those cases where brick pits are provided, a succession is more easily maintained. For autumn use Michaelmas White, Self-Protecting Autumn, and Walcheren are excellent; Superb Early White, Snow's Winter White, and Christmas White, turn in during open weather in December and January. Successional varieties during late February, March, and April often turn in rapidly, and amongst the forms that head in twelve months after sowing the seeds there are the Purple and White Sprouting, Knight's Protecting, Snow White, Veitch's Spring White, Leamington, Sutton's Perfection, Penzance, and Reading Giant are all good varieties. The later maturing ones are Model, Satisfaction, Late Queen, Universal Protecting, and Latest of All. In gardens there is no need to prolong the broccoli season after the more dainty cauliflowers turn in, which should be towards the end of May.

Turning again to the autumn when the heavy rains and frosts have mutilated many of the cabbages we are able to continue supplies in the curled-leaved forms, and very excellent they are. Such small savoys as Tom Thumb, Early Dwarf Ulm, and Sutton's Reliance are of splendid quality; the latter variety is later and keeps well. Dwarf Green Curled is a universal variety, and Best of All is a fine Early Drumhead type, and for large establishments always needed, as is also a breadth of the late Green Drumhead. The savoy often escapes caterpillars better than some other forms of brassicas do. All the same, when these pests are numerous, the curled savoy does not escape their notice entirely.

The borecoles, or kales, are too often neglected, and sometimes condemned as lacking quality; the latter point is true enough if they are served out of season, but having withstood the rigour of the winter, in early spring their tender young shoots are very wholesome. Among recent introductions to this section Veitch's New Sprouting, and Carter's Chou de Russie are well worth growing, both varieties showing good qualities in the Wisley trials. The curled forms are many, Sutton's A1, Veitch's Exhibition, and Carter's Dwarf Extra Curled are all ornamental and good, and nearly all the Scotch Curled strains offered are valuable. The very dwarf forms of Arctic Curled are exceedingly hardy and rarely damaged by frost. Cottager's Kale, or the more uniform selection of Hardy Sprouting should also be included. The Drumhead Kales are of fine quality, but are often irregular in growth, and suffer from wet and frost too much to be relied upon. Of course, the Asparagus Kale is always excellent in the spring, providing it has escaped mildew during the previous summer's growth.

Enough, however, has been said to cause those interested in the multitude of forms to seek for further knowledge, but the varieties named here in their sections have been tried and found reliable, and there are many others, too, that serve a useful purpose in special cases. Utrum horum mavis occipe. C. FOSTER.

Sutton Green.

FIGS ON PERGOLAS.

Besides the usual methods of culture there is another useful and ornamental way of growing figs in the open air. We may find, at the present time, in some of our old country gardens, old veteran trees growing, and trained to walls; but that is not the way that I would treat the fig in the open air, except in the more northern counties. I prefer to plant the trees and train the branches over pergolas.

In one garden that I had charge of for many years, there was a row of fig trees about three hundred feet long. Originally the trees were intended to be trained on a wall, as they were planted close to the latter; but the trees were nearly one hundred years old, and their branches had not only covered the wall space, but a plot of ground about twenty-five feet wide besides, running the whole length of the wall. Twelve feet distant from the latter a very strong pergola was erected and the giant branches were satisfactorily disposed over it, the effect being a noble one. Very little feeding took place, and these old trees bore heavy crops of fruit every year on well-matured wood.

Starlings were their chief enemy, as the birds would swoop down in flocks and clear the whole of the fruit away in less than two days just as it was approaching maturity. But the loss from this cause was prevented, after one or two experiences, by spreading large fish nets over the top of the trees; the branches were so strong that a number of men could climb from one to the other with safety while engaged in placing the nets in position. White Ischia, Black Ischia, Brunswick, and Brown Turkey were the principal varieties grown. In other parts of the garden the trees were treated as huge bushes and not stiffly trained to the walls.

ROSES IN POTS.

WM. PAUL & SON

Respectfully invite attention to their magnificent stock of the above, which they believe to be unrivalled in quality and extent.

DWARFS OR BUSHES, extra strong, in 8 inch pots, for Forcing and Greenhouse Culture ... **30**/- to **60**/- per doz.; **£12** and upwards per 100.

CLIMBERS AND RAMBLERS, in 8 inch pots, for Forcing and Outdoor Planting on Pergolas, Arches, etc., with shoots 6 to 12 ft. long ... **30**/- to **60**/- per doz. Ditto, with shoots 12 to 16 ft. long, **72**/- to **90**/- per doz.

Price per 100 on application.

DWARFS AND CLIMBERS, smaller plants, in 5 inch pots, **10/6** to **18**/- per doz.; **75**/- to **£6** per 100.

Priced List Post Free on Application.

INSPECTION OF STOCK INVITED.

The Nurseries are 12 miles from London, four minutes' walk from Waltham Cross Station, G.E.R.

SOLE POSTAL ADDRESS—
WM. PAUL & SON,
WALTHAM CROSS, HERTS.

FOR SWEET PEAS 1910.

IF YOU WANT

REALLY GOOD SWEET PEAS

AT MODERATE PRICES, send to

ROBERT SYDENHAM LIMITED, 33, Tenby St., Birmingham.

No Flowers give so much cut bloom at so little cost and trouble as Sweet Peas.

SPECIAL COLLECTIONS FOR 1910.

The seeds in these Collections are all carefully hand picked; only plump, round seeds sent; all small, poor, or doubtful ones are taken out, which we do not think is done by anyone else in the trade; eighty to ninety per cent. guaranteed to germinate if treated as instructions sent with each collection.

EACH PACKET in Nos. 1, 2, and 3, CONTAINS 50 PLUMP, ROUND, SELECTED SEEDS.

Buyers not wanting any collection complete, may select their own varieties from EITHER COLLECTION, where priced at prices mentioned, and have 2s. 6d. worth for each 2s., or five packets of any one variety at price of four.

COLLECTION No. 1—Twelve Useful Varieties, 1/3.

Dainty, white, with slight pink edge; **Dorothy Eckford**, white; **Gladys Unwin**, waved pink; **Henry Eckford**, salmon-orange; **Hon. Mrs. Kenyon**, pale primrose; **Jeannie Gordon**, carmine and buff; **Miss Willmott**, salmon-red; **Navy Blue**, deep violet blue; **Queen of Spain**, salmon pink; **Romolo Piazzani**, rich blue; **Salopian**, deep mulberry red; **Triumph**, rosy salmon and blush.

COLLECTION No. 2.—Twelve Good Varieties, 1/9.

A. J. Cook, pale lavender purple; **Duke of Westminster**, rosy violet; **Evelyn Byatt**, orange and rose bicolor; **King Edward VII.**, rich crimson; **Lady Grisel Hamilton**, pale lavender; **Lord Nelson**, dark blue; **Lucy Hemus**, carmine and buff; **Mrs. Collier**, pale primrose; **Nora Unwin**, waved white; **Paradise**, rich pink, waved; **Prince of Wales**, rich deep rose; **Sybil Eckford**, creamy buff, flushed pale pink.

SINGLE PACKETS OF ANY VARIETY IN COLLECTIONS Nos. 1 and 2, 2d. EACH.

COLLECTIONS Nos. 1 and 2, when bought together, will be 2/6,
and a packet each of "Janet Scott" and "Jet" will be added free of charge.

COLLECTION No. 3.—Twelve Best Varieties, 2/6.

Black Knight, rich, dark bronzy chocolate; **Chrissie Unwin**, cerise-scarlet, waved; **Clara Curtis**, the best waved primrose; **Countess Spencer**, large wavy pink; **Etta Dyke**, the finest waved white; **Frank Dolby**, waved lavender; **George Herbert**, waved carmine and rose; **Helen Lewis**, waved orange and rose; **Helen Pierce**, marbled blue; **Mrs. Hardcastle Sykes** (30 seeds only, as this variety partly failed), waved blush pink; **Mrs. Walter Wright**, rich rosy mauve; **Queen Alexandra**, the best crimson scarlet.

SINGLE PACKETS OF ANY VARIETY IN COLLECTION No. 3, 3d. EACH.

COLLECTIONS Nos. 2 and 3, may be had together for 3/6,
and a packet of "Phenomenal" and "Millie Maslin" will be added free of charge.

SPECIAL PRICE FOR THE THREE COLLECTIONS, 4/6,

and when bought together, the four added packets and a packet each of the four best striped varieties, viz.:—

Jessie Cuthbertson, Mrs. J. Chamberlain, Prince Olaf, and Unique

will be added free of charge, making 44 of the very best varieties in cultivation, at an average cost of about one penny a packet.

PRICE OF EITHER OF THE EIGHT ADDED VARIETIES IF WANTED ALONE, 2d. EACH.

COLLECTION No. 4.—The Twelve Newest Varieties 4/-,

Or, what we consider the best of the newest.

SPECIAL NOTICE.—The price of, and number of seeds of each variety in Collection No. 4 varies. The number of seeds in each packet is stated in figures after each name. Any variety not priced cannot be sold apart from the collection.

Apple Blossom Spencer (40), rosy pink and blush, waved **6**d.; **America Spencer (15)**, bright rosy-scarlet flake, waved; **Black Knight Spencer (25)**, rich dark maroon, waved, **6**d.; **Constance Oliver (20)**, creamy buff ground, flushed deep pink, waved; **Evelyn Hemus (20)**, waved, primrose with picotee edge of pink, **6**d.; **Marjorie Willis (15)**, a **Prince of Wales Spencer**; **Miriam Beaver (6)**, a pinkish-salmon on buff ground, **3**d.; **Mrs. Charles Foster** or **Asta Ohn (20)** beautiful waved lavenders, **9**d.; **Paradise Ivory (20)**, a pale primrose with slight tinge of pink, waved, **8**d.; **St. George (40)**, a grand orange scarlet, **6**d.; **Sunproof Crimson (6)**, a large, well waved rich crimson, a much improved **The King**, and absolutely sunproof, **1**s.; **The Marquis (15)**, a large waved rosy mauve.

COLLECTIONS Nos. 3 and 4 may be had together for 5/6,
and a packet of the New White Everlasting Pea, WHITE PEARL, 25 seeds added free of charge.

SPECIAL PRICE FOR THE FOUR COLLECTIONS, 7/6.

which, with the nine added varieties, will be 57 in all, and making it the best collection, considering the varieties, ever offered for the money.

A few packets each of Burpee's MARIE CORELLI (10 seeds), 6d.; Burpee's W. T. HUTCHINS (6 seeds), 6d.; MRS. CHARLES MANDER (25 seeds), 6d.; MRS. ROUTZAHN SPENCER, re-selected (20 seeds), 6d.; OTHELLO SPENCER (15 seeds), 6d.; PARADISE CARMINE (15 seeds) 6d.; TENNANT SPENCER (15 seeds), 6d.; ZEPHYR (15 seeds), 6d., or a packet of each for 3s., but they are sold without guarantee as to their being perfectly fixed.

ALL OTHER SEEDS EQUALLY GOOD AND CHEAP. FULL LIST ON APPLICATION.

MR. ROBERT SYDENHAM'S

popular little book

ALL ABOUT SWEET PEAS.

The New Edition, revised to end of 1909, has many important and useful additions; it should be had by all before purchasing their seeds for 1910; it describes over 700 varieties and gives a useful list of too-much-alike varieties, and will save many from buying the same varieties under many different names, which has been quite a nuisance to the general buyer the last two or three years.

This Edition will be bound in stiff covers and charged **6d.** each, but the Sixpence may be deducted from the first five shilling order.

The best and most useful book published in a compact form. Size, about 6 inches by 4 inches.

NOW READY.

BEGONIAS FOR SUMMER BEDDING.

In referring somewhat briefly to the begonias most suitable for the production of colour effects in the flower garden during the summer months, there is no occasion to dwell at length on their value for that purpose. Their utility is great, but it is now generally recognised, and the question uppermost in the minds of those who are concerned with begonias for bedding is not so much whether they can be successfully employed in the flower garden as the relative merits of the several types. Sometimes comparisons are instituted between begonias and zonal pelargoniums, but these do not appear very desirable, because the two classes of flowers differ so widely from each other, except in colour, that both should be included in a scheme of a comprehensive character. This general statement applies, of course, to gardens where both begonias and zonal pelargoniums are satisfactory in ordinary seasons; but should the weather conditions of a district be more favourable to the one than the other, a careful comparison should be made between them for the purpose of determining which of the two is the best adapted to the conditions that obtain in the particular locality. As a guide to those who have not instituted such comparison, it may be stated that where the soil is light and the climate comparatively dry, as in the south and eastern parts of England, zonal pelargoniums will bloom so freely as to leave but little to be desired; and that in the western and northern parts, where the rainfall is usually heavy, the begonias will produce the best effects. In wet seasons such as the summer of last year, begonias are the most satisfactory, while in dry ones the advantage will be in favour of zonal pelargoniums. Much may be done by thorough soil preparation to reduce the difference in flower production in the several districts that are not, generally speaking, equally suited to both.

A BEAUTIFUL BED OF BEGONIAS AND FINE-FOLIAGE PLANTS

In the gardens of Hopetoun House, Linlithgowshire.

In making selections, owners of gardens will, as a matter of course, be guided by their taste; and gardeners will give full consideration to the wishes of their employers. If bold flowers are preferred they will select from the large-flowered tuberous varieties now so generally grown; but if flowers of medium size are regarded with most favour, attention will be given to the small group of varieties of which Worthiana is typical. Again, if the begonias are simply wanted as a carpet or groundwork for beds filled with flowering or fine-foliage plants of some height, or for the formation of marginal bands to beds, then the dwarf semperflorens varieties will be selected. In the majority of cases the best effects will be obtained by utilising all three types in due proportions.

A commencement might in each case be made by raising a stock from seed, and if the sowing is made at once, and the seedlings grown under favourable conditions, they will be of a suitable size for bedding out at the end of May, and for commencing to flower freely before the summer is far advanced. This, however, is not the best course to follow in raising a stock for use in the flower garden, because the seedlings will vary considerably in growth, size of flowers, and colour, and the effect will probably fall short of the expectation. The best course will be to purchase a stock of bulbs raised from seed sown last year, and selected according to their colours. Even the best selections are not really costly, and if the colours required are stated, and the medium or higher priced selections purchased, there will be no difficulty in producing the desired effects. For use in the flower garden next year a stock may be raised from seed sown early in February, and the plants so raised be grown in the kitchen garden during the coming summer. When in bloom they can be readily marked with short sticks in such manner as to allow of their being readily assorted according to their colours when lifted in the autumn.

The tubers should be ordered rather early in the year, and be started at the beginning of March, a frame being the best place in which to put them. It is an advantage to place the pots or boxes on a mild hotbed, and to maintain a temperature of about 60 degrees, and a rather humid atmosphere until growth has made some progress. From this stage very little artificial heat will be required, and the ventilation should be moderate, and the plants receive a light spraying. The one point at which to aim is a firm, short-jointed growth.

The varieties that can be grouped around Worthiana are mostly dwarf in growth, have a free branching habit, and bear their elegant flowers quite clear of the foliage. The flowers of Worthiana are quite pendulous, but those of the others are not so, or only to a small extent. Varieties belonging to the group do not appear to have obtained a very prominent position in trade collections, and they are usually met with in private gardens either without name, or bearing names which suggest that their nomenclature has become much mixed. The following may be mentioned as especially desirable: Bertini, an improved form of Worthiana; Bertini nana compacta, a dwarfer variety with larger flowers; Washington, Swanley Bedder, and Halton Bedder, these all have scarlet flowers, and are remarkably free. The last-named is used with much success by Mr. T. Hay in the flower gardens at Hopetoun House, the seat of the Marchioness of Linlithgow, the beds being, as in the case of the one illustrated herewith, simply carpets of flowers, that would be almost painful in their brilliancy were not variegated abutilons and a few other light foliage plants tastefully interspersed. Especially noteworthy, also, in the Hopetoun House Gardens was Madame Mandiot, a dwarf growing begonia with pleasing pink flowers, of much value for bedding.

These varieties should, for bedding purposes, be raised from cuttings to ensure uniformity in growth and colour. Cuttings can be readily rooted during the summer, and if care is taken to see that each cutting has a bud in the axil of the leaf at the lowest joint, there will be no difficulty in obtaining a free growth in the spring. Cuttings may also be rooted after the growth has commenced in the spring, but summer propagation is preferable. The tubers should be started into growth in much the same manner as advised for the large-flowered varieties.

The varieties of Begonia semperflorens that are utilised for bedding are of dwarf growth, ranging from six to twelve inches, and vary from white to bright crimson. Crimson Bedder, which has deep bronze-coloured stems and leaves and bright crimson flowers, and Fairy Queen, pink and white, are perhaps the most useful of the taller forms. These may be raised from seed or from cuttings, as may be desired. G.

CONIFERS FOR LAWN SPECIMENS.

When growing under favourable conditions, with suitable surroundings, many coniferous trees are unsurpassed in usefulness for garden decoration, whether planted in groups or used as isolated specimens on lawns. Unfortunately, it but too frequently happens that the conditions under which the trees are planted are such as to render it quite impossible for them to develop properly, and instead of forming really beautiful objects they become an eyesore and a disgrace to their kind. Even when the best cultural conditions possible are at hand, a few kinds obstinately refuse to thrive, but this is an exception, and a few kinds only are really difficult. The most favourable conditions under which conifers thrive are nearly approached in sheltered positions on the West Coast of Scotland, and in the south-west counties of England and Wales and in Ireland, where the temperature is fairly equable, the atmosphere humid, and the soil rich and moist, but fairly well drained. Perhaps the most unsuitable conditions prevail in manufacturing towns where the atmospere is heavily charged with smoke and other impurities, and where the soil is naturally hot and dry in the summer-time. In fact, conifers are not town trees, that is, towns where large works are carried on and smoke abounds, and it is unwise to introduce them to gardens in such places. Conifers again, are not the best kind of trees to plant in tiny villa gardens, for many of the more ornamental kinds assume very large proportions, and require abundance of room to develop properly and exhibit their individual peculiarities to the best advantage. Cooped up in a tiny garden these lordly trees are quite out of place; therefore, they ought to be left to gardens of more pretentious dimensions. There are, of course, some small-growing conifers that might be used, but, as a rule, it is the larger growing kinds that the owners of tiny villa gardens aspire to.

Lawn specimens usually have abundance of room given to them, and the green carpet of turf round about adds materially to the appearance of the trees. It is always advisable when first planting the trees to work the ground thoroughly, and each tree should have a hole eight feet in diameter trenched for it, and, if poor, the ground ought to be enriched by soil of better quality and by half-decayed leaves. The nature of the soil, of course, has to be taken into consideration when the holes are being prepared, a larger hole being necessary in very heavy or very poor soil than in that of a lighter or richer character.

In such a large family there is, of course, a considerable number of meritorious subjects, but it will be advisable to mention a limited number only, consequently, although the subjoined list is made up of really good trees, they cannot be said to be better than some which have had to be unavoidably left out; they will, however, serve to direct attention to the family and perhaps assist some persons in the selection of their lawn specimens.

Cedrus.—It is possible that no exotic tree enjoys so much popularity as the Cedar of Lebanon, C. Libani, and it is difficult to imagine a more imposing object than a mature example, with a massive trunk and large canopy of branches, many of which are to be seen about the metropolis and home counties. It is not, however, to this tree that special attention is directed now, but to the Blue Atlas Cedar, Cedrus atlantica glauca. This is a free-growing tree, of noble presence. When young it is of pyramidal outline, uniformly branched from base to summit with ample foliage of a rich glaucous colour. It requires plenty of room to show its attractions to the best advantage.

Pinus excelsa is a handsome species belonging to the five-leaved or Strobus group, with long, pendulous, silvery-marked needles and pendant resinous cones nine inches long. It is a native of the temperate Himalaya, and is commonly known as the Bhotan Pine. When once established it grows vigorously and forms an imposing tree. P. insignis is the principal pine of the south-west counties, and in Devonshire and Cornwall and such like places it grows with astonishing rapidity, and forms an exceptionally handsome tree. Its peculiarities are its bright green leaves and large cones, which are much more fully developed on one side than on the other. P. Bungeana, the Lace Bark Pine of Northern China, is a rare and little-known species, but one which is eminently suited for planting as a lawn specimen. It is of rather dense habit and somewhat slow growth, and possesses the peculiarity of shedding its bark in a similar manner to the plane.

P. monophylla is also the sort of tree to treat as a lawn specimen. This differs from other pines by its leaves usually appearing singly, not in bundles as in other kinds. It is of slow growth, and requires less room than the previously mentioned kinds.

P. sylvestris.—As a young tree, this, the Scot's Pine, has nothing particular to recommend it as worthy the honour of a place as a lawn specimen, but where old examples exist they are usually jealously guarded, for no more imposing objects can be imagined in a landscape than a number of old Scot's Pines with long trunks quite branchless, except for a comparatively small head of branches which have weathered the storms of a couple of hundred years, and, though battered and broken, are nevertheless beautiful.

Cupressus Lawsoniana, or Lawson's Cypress, is represented in gardens by a large number of varieties, many of which are decidedly ornamental. Three only, however, are mentioned here as representative of the rest. They are C. L. filiformis, an elegant variety with pendant secondary branches and green foliage; C. L. intertexta, an ornamental green-leaved form of very pleasing outline, and C. L. gracilis aurea, a free-growing, golden-leaved variety. Other cupressus of pleasing appearance are C. nootkatensis pendula, C. obtusa Crippsii, and C. pisifera plumosa aurea.

Libocedrus decurrens is a stately Californian tree of columnar outline, with very dark foliage. It forms an attractive object standing sentinel-like amongst other trees on a lawn, or planted half a dozen or so together to make a specimen group.

The Japanese Umbrella Pine (Sciadopitys verticillata) ought to occupy a sheltered position, and be given moderately light soil containing a little peat. It is a most interesting tree, and of very ornamental appearance. A position may be given where a slow-growing specimen is required. Ginkgo biloba, the Maidenhair tree, is a general favourite, and worth planting as a select tree. Its curious flattened leaves which resemble in form the pinnules of a Maidenhair fern, are distinct from anything else we have. It is, of course, deciduous, and it thrives fairly well in towns.

Another deciduous tree of more than ordinary merit is the Golden Larch, Pseudolarix Kæmpferi. This is a Chinese tree which is seen at its best in autumn, when the foliage takes on a brilliant golden colour previous to falling.

A damp place near the margin of a stream or lake might well be given up to a specimen of the deciduous cypress, Taxodium distichum. When young, this is of somewhat columnar outline, but with age a looser habit is developed. Its leaves are a delightful shade of green in spring, and a rich copper in autumn previous to falling.

Amongst the spruces we have Picea Morinda, a Himalayan tree, with long pendulous branches and long leaves. It forms a large tree of noble outline. P. pungens glauca is a stiff-habited tree, with rich bluish leaves. It is, however, a rather difficult tree to deal with, for, whilst it thrives excellently in one garden, it may be an utter failure in the next from no apparent cause. The Servian Spruce, Picea Omorika, has lately attracted attention as an ornamental tree of free habit and pleasing outline. The firs offer numerous suitable examples for lawns, such kinds as Abies concolor, A. Lowiana, A. Pinsapo glauca, A. Mariesi, and A. brachyphylla being all beautiful. When at their best A. nobilis and A. magnifica are very pretty, but unfortunately it is very rarely that one sees them in good condition, for they are martyrs to disease.

Several yews demand attention, particularly Taxus baccata var. Dovastoni, T. b. elegantissima, and T. b. adpressa, all of which are worth conspicuous positions.

Pruninopitys elegans, the plum-fruited yew, forms an excellent bush for the outskirts of a lawn. Though of yew-like character, it is quite distinct from the yew, and is of lighter appearance. Another good substitute for the yew and a tree of less sombre aspect is Tsuga Sieboldi. It grows freely and forms a large bush clothed to the ground with branches, or, if crowded, a tree-like habit is assumed. Another Tsuga of pleasing appearance is T. Pattoniana glauca. It has pretty glaucous leaves, and forms a shapely bush. Unfortunately, it is only hardy enough for the milder counties.

For the milder counties Fitzroya patagonica and Athrotaxis cupressoides form a couple of useful subjects, whilst Saxegothea conspicua might be more frequently used.

W. D.

SEASIDE ROSES.

I often wonder why so many people have an idea that only a few of the very hardiest roses will thrive by the sea. Provided we give a little judicious shelter from direct wind off the water, I think there could scarcely be a more ideal situation. Perhaps the greatest drawback is the unsuitable soil in many cases, poor, chalky soil so often predominating. A lover of flowers would soon remedy this, and at comparatively little cost.

During the summer of 1909 I saw many of the choicest and generally delicate varieties of roses doing extraordinarily well at Brighton. They were just away from the sea wind, which is often too boisterous for most plants, independently of its saline properties. In this instance, as is so often the case, the soil was full of small flints; so much so that the whole soil to a depth of many feet had been passed through a screen in order to secure the flints for road making. The resulting soil was a stiff yellowish loam, that did not bind particularly close owing to the presence of flint chips and coarse sand, which had passed through the screen. When I say the garden consisted of such soil to a depth of four or five feet, and my friend had manured liberally, there is little cause for surprise he had such grand results.

We cannot all do this, but there are very few places where roses could not be grown if a little attention were paid to suitable drainage and manure. Too often it is the builders' refuse and excavations from cellars, etc., that are dumped down to form a garden, and this must be remedied in some way. A little consideration will suggest what is most needed in each case; but I think we do not allow enough for the excessive drainage generally found in town gardens, and, in addition to this, it is only occasionally that the soil has a thorough soaking naturally. With adjoining houses, and the great absorption of moisture by the walls of all buildings, there is seldom more than surface moisture, unless applied artificially. Too dry a soil is no doubt the frequent cause of failure when growing roses upon walls or buildings; but if we really appreciate our plants this matter will be soon remedied.

I would recommend lifting a portion of the soil, going sufficiently deep to find what sort of bottom exists, and then making up the compost accordingly. Sooty matter, and the old mortar rubble left by the builder often predominate, and may be helped by stiff loam. It not infrequently happens that there is fairly good loam buried beneath this refuse, and before putting in any plants I would certainly ascertain what there is below. No special soil is absolutely necessary for roses; if it was we should not see such grand exhibits in all parts of the kingdom, and from such varying soils.

To place roses upon walls facing the open sea is courting failure, but upon the sheltered sides, and in enclosed gardens, there is no reason why we should not have a good show if the most suitable varieties are chosen. Any that do well in the suburbs will do even better by the coast if direct sea-wind is guarded against.

Gloire de Dijon, Ards Rover, Felicité Perpetué, Madame Alfred Carriere, William Allen Richardson, and Reine Olga de Wurtemburg, are half a dozen good hardy climbers giving a good range of colour. Most of the Wichuraianas are delightful during the early summer months, and do well when slightly protected from wind. In fact almost all roses will thrive upon the coast, and the greater freedom from frost, owing to the saline properties, is helpful rather than harmful, as I fear many amateurs imagine.

We have some beds to plant where there are only a few inches of soil above chalk. The adjoining piece of ground was planted two years ago, and I have seldom seen roses thrive better. Of course, in this case labour is a considerable item. It is absolutely necessary to remove the chalk to a depth of three or four feet, and replace with good loam, but the results from the previous planting are so good that this will be amply repaid. It is a good object lesson to note how differently the plants are doing in the two adjoining gardens. Those in the shallow soil have found it difficult to exist, while upon the prepared ground they are most satisfactory, and the warm situation, helped by the natural chalk drainage, produced a more than usually good show during the wet and cool season of 1909.

Liquid manure during the growing season is a great help where there is rapid drainage, and this can be supplemented by a fairly rich mulching early in the spring. Personally, I do not favour heavy winter mulching of roses. It retains the wet too much, and few things are more injurious than wet and frost combined. Nor are the roots sufficiently active to use such food when washed down to them, and to my mind a great deal of waste thus occurs.

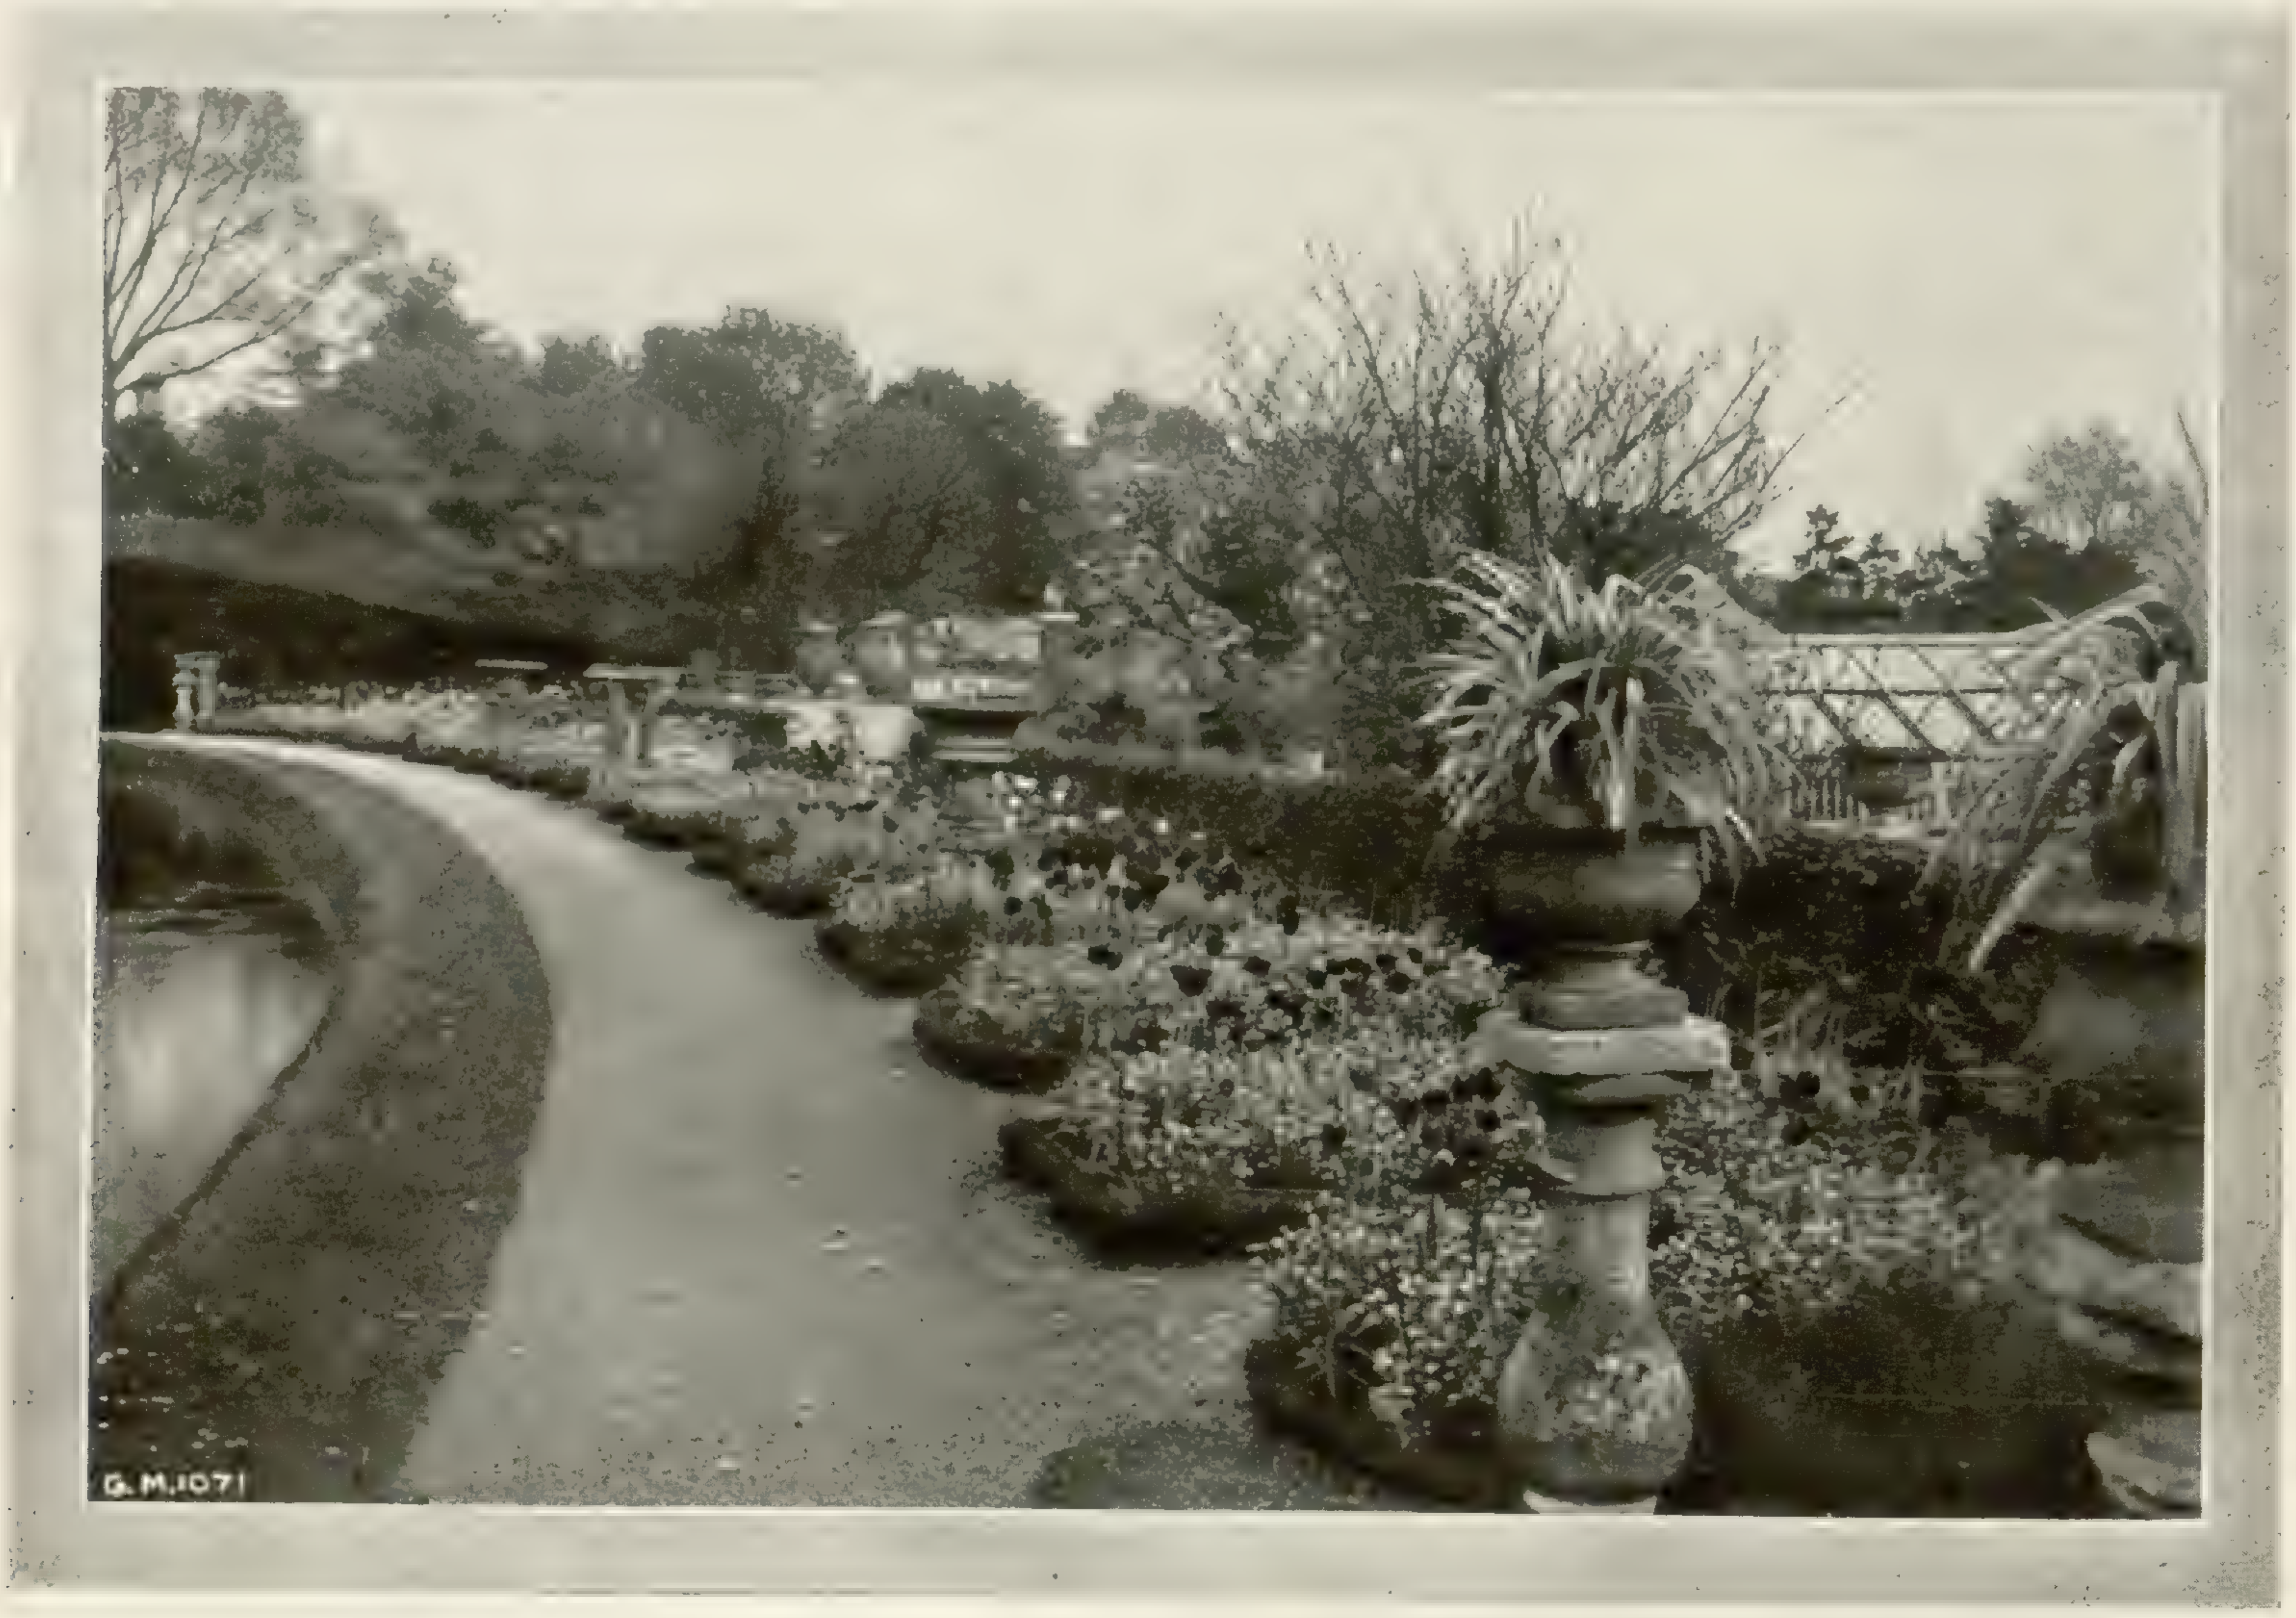
Uckfield. A. PIPER.

VIEW IN ROCK GARDEN, MYDDLETON HOUSE.

Ordering Seeds.—This important matter will now claim our attention. Pains should be taken to include varieties of the very best type for the main crops, remembering those which are successful in one's locality. A few novelties should be included for comparison with the standard kinds, as these are always of interest, if not at all times superior to others. The selection of seeds from the many seed lists is interesting work during the long winter evenings.—G. ELLWOOD.

MYDDLETON HOUSE GARDENS.

Those who have had the pleasure of being associated with Mr. E. A. Bowles in the horticultural work that is done at Westminster, whether it be round the table of the Floral Committee or at the meetings of the Scientific Committee, over which he so ably presides, will not need to be told that he occupies a foremost position among the leading authorities on hardy plants. Nor will they be surprised to learn that the gardens of Myddleton House abound in interest, and are rich in attractions to the plant lover. On the other hand, to those who have not had an opportunity for becoming acquainted with Mr. Bowles' remarkable knowledge of the various classes of plants that thrive under the outdoor conditions that obtain in this country, a walk through these gardens will afford a succession of surprises and not a little pleasure, especially if he be their guide. The surprises will perhaps be all the greater because the gardens are free from the peculiarities that sometimes characterise those in which special attention is devoted to some particular class of plants. The spacious grounds, in which stands the stately edifice that reminds us of Sir Hugh Myddleton, who projected and carried out the great scheme for bringing water to London, contains noble trees, handsome shrubs, roses in groups and running riot over a rustic pergola, closely shaven lawns, and other objects that at once appeal to all who appreciate the charms of a well-furnished garden. In addition, there is a large rock garden, in which the plant lover might spend a day without exhausting its interest; breadths of iris, in which many varieties have a place, and a comprehensive collection of May-flowering tulips that, in the month in which the varieties forming the section yield of their floral beauty, forms an especially attractive feature.



MAY-FLOWERING TULIPS, MYDDLETON HOUSE.

As an indication of locality it should be mentioned that Myddleton House is situate about two miles to the north of Enfield, and is midway between that town and Waltham Cross. The mansion is of handsome elevation, and its substantial character suggests that it belongs to the time when the district enjoyed a high degree of popularity for residential purposes among the wealthy citizens of London. The grounds are extensive, and tastefully arranged, and among the many fine trees that add grace and dignity to them is a noble Cedar of Lebanon, which may possibly be a direct descendant from the tree in the Enfield palace grounds, that has long been regarded as of historic importance, and as the parent of several of the specimens that at the present time grace the gardens north of London. Associated with the many noble trees of considerable age are some that are comparatively young, and these are of interest as indicating an appreciation of kinds that are remarkable for beauty of their flowers or leafage, and have been brought prominently into notice within a recent period. On the south side of the lawn contiguous to the house trees and shrubs were, in the distant past, planted in such manner that now they have attained their full development form a broad belt, and afford shelter from strong easterly winds, and also grateful shade during summer days.

The grounds are intersected by the New River, which flows placidly along on the other side of the belt of trees, and while nothing has, for obvious reasons, been done to utilise it in the cultivation of water-loving plants, its banks have been made highly attractive. These are necessarily formal, but as the eye roams over the tasteful grouping of flag irises on one side, and the glorious display of tulips on the other, the enjoyment of the scene is not lessened by the formality of the boundaries of the river. There is no occasion to give a lengthy description of the river scene, or to speak in eulogistic terms of the taste and judgment evinced in planting the banks, for the reader who carefully examines the illustration of it will at once recognise that it is of surpassing beauty, and must have been the work of someone possessing exceptional taste. The irises in the immediate foreground comprise some of the finer forms of Iris florentina, and a few plants of the typical I. germanica, these latter being added with a view to break up the uniformity characteristic of a group consisting wholly of the former. Immediately beyond are several of the finest of the German irises now in cultivation, which, as in the case of the varieties of the Florentine iris, prove to demonstration their suitability for planting on the higher ground alongside running streams, and on the margins of ponds and lakes. Round the bend of the river are large groups of Iris pallida in variety, and of the yellow-flowered kinds, as I. flavescens, I. variegata, etc., and these, it need hardly be said, are immensely attractive. Mr. Bowles is careful that these flowers have good cultivation, and an essential feature of this is periodic replantings, and in case it might be thought that the group illustrated is rather thin, it may be well to mention that replanting had been done in the year previous.

The opposite bank is hardly less attractive than the one to which reference has been made, but the attractions are of a quite different character. Instead of irises growing as if they had been planted by the hand of Nature, there are formal beds filled with tulips, that, whatever may be their charms, and these are great, possess the formality that so strongly characterises flowers that have been in some degree moulded by the florist in his endeavour to compel them to conform to his ideals of beauty. Mr. Bowles devotes much of his attention to the May-flowering tulips, and

The photograph is marked "G.M.1071".

some part of his comprehensive collection he utilises in beautifying the riverside late in spring. In each bed one variety only is planted, and the whole of the beds have as a groundwork Warley Blue forget-me-not, a variety of great merit, being alike remarkable for its freedom in blooming and for the relatively large size and rich colouring of the flowers. The other part of the collection of tulips have a place in the borders of the kitchen garden, and it would be difficult to imagine anything more delightful, floriculturally speaking, than to spend an hour or so with Mr. Bowles among his tulips. The stone pillars associated with the tulip beds are part of the balustrade of the old London Bridge.

Recrossing the river there is, midway between the irises illustrated and those round the bend, a recess occupied by choice shrubs, and conspicuous among them is an old market cross, which long occupied a position in the market place of Enfield, and was acquired some years since. Here we have also the south end of the rustic pergola, which, richly furnished with flowering and ornamental-leaved plants of scandent habit, constitutes a feature at once distinct and attractive.

A CHARMING WATERSIDE SCENE, MYDDLETON HOUSE.

For some years Mr. Bowles has devoted a considerable share of the attention he has given to these delightful gardens to the study and the cultivation of alpine plants and other choice subjects that thrive under similar conditions, and as the result he has formed an extensive collection and placed the several kinds under the conditions most favourable to their full development. The rock garden has the advantage of being sufficiently spacious to afford accommodation for an extensive collection of plants, in which many differ considerably in their cultural requirements, and it occupies a position with sufficient slope to remove any apprehension with regard to the escape of surplus moisture. It will be seen from a glance at the illustration herewith of a portion of it that it has been constructed in such a manner as to afford the best possible accommodation for the plants, rather than to display skill in the arrangement of rock work. The general design is a series of valleys and ridges, the latter of moderate height, and sufficient rockwork is used to keep the slopes in position, and to provide the conditions essential to the successful cultivation of the various kinds that have found a home upon them. By this somewhat simple arrangement so great a diversity of aspects have been provided that no difficulty has been found in giving the plants the positions best suited to them, and, what is not less important, the whole of the plants can be readily reached, and their distinctive characteristics seen from within a short range.

One of the valleys is admirably shown in the accompanying illustration, and on the high ground of this part of the rock garden there are numerous leguminous plants of special interest. Prominent among other fine kinds are Cytisus purgans, one of the prettiest of the species; and C. fragrans, a distinct species bearing pale pink flowers with the scent of the hyacinth. On the crown of the ridge to the left is growing a collection of brooms, prominent amongst the several forms being Cytisus hirsutissimus, C. trifoliatus, C. sessilifolius, C. Kewense, a charming hybrid, that is highly attractive when seen, as is the case here, spreading over the rocks, and carpeting them with its soft yellow flowers. Still further to the left are C. austriacus, C. glabrescens, C. capitatus, C. sericeus, and C. decumbens, the last-named trailing over the stones at the left-hand edge, and Genista germanica and G. horrida.

Immediately in the foreground, to the right and left of the pathway leading through the valley, small bog gardens have been formed, and in these a goodly number of plants that thrive in bogs give evidence of being quite at home. In the bog to the right grow the white Erica tetralix and E. cinera, and Rubus arcticus, which fruits freely; and in the chinks of the stones that form the back of the bog garden to the left are the blue and white forms of the Pyrenean ramondia, which annually in their season produce a wealth of their exquisitely beautiful flowers. The bog garden to the left is filled with a very deeply-coloured form of Primula rosea, Pinguicula grandiflora, and the blue and white forms of Lobelia syphylitica.

There are on the slopes attractive breadths of the double Arabis saxatile and Arabis albida, and also of the green-leaved and variegated arabis with single flowers. There are also fine breadths of the best of the perennial candytufts, which grow vigorously and bloom profusely; and conspicuous among other good things is the beautiful Anemone sylvestris grandiflora. The dark tree at the top left-hand corner of the rockery is a large specimen of Azara microphylla, and below it, to the right, is an example of Ægle sepiaria, which was raised from a seed given to Mr. Bowles by Canon Ellacombe, who had taken it from a fruit ripened in the open in his garden at Bitton. On a dry bank at the top of the garden is a collection of hardy opuntias, which are of so much interest as to render it a matter of regret that space will not admit of their being referred to with some detail.

GEORGE GORDON.

Double Arabis and Muscari Heavenly Blue.—I quite agree that the brilliant blue of the latter would look "very distinct above the white flowers" (see answer to "W. H. C.," on p. 1,001, G.M., 1909). But all the double arabis which I have grown hitherto would very quickly cover and completely hide the delicate little muscari.—J. C.

THE SWEET PEA YEAR OF 1909.

Retrospection is almost always interesting, but if it is no more than that it serves a very small purpose. If, however, looking backward for a while helps us to look forward with more confidence, impresses upon us the causes of failure and success, and leads us to provide against the one and for the other, then it serves a very useful purpose.

Almost every seed catalogue that arrives contains some reference to the unfortunate seed season of 1909, and these references serve usually as an apology for short stocks of seeds and higher prices. In the case of novelties there is unquestionably a shortage, and many a grower of new sweet peas has been quite unable to put certain of the new varieties on the market. "Crop failed" is printed under, over, or at the side of the description of some charming sweet pea, and so we must be satisfied with the description alone. There is an idea abroad among some keen amateurs that "crop failed," "short crop," etc., are merely sharp practice on the part of seedsmen, who wish to obtain excessive prices and prevent the variety from getting into the hands of other dealers quickly. I am sure this idea is a huge mistake, and it is adding insult to injury to write offensive letters to the already troubled raisers and distributors.

PERGOLA AND OLD MARKET CROSS, MYDDLETON HOUSE.

The way in which sweet peas collapsed in many gardens at the end of July was extraordinary, and those who did not experience this disappointment cannot have any idea of the rapidity with which row after row of promising plants, all apparently in fine health and the full flush of flowering, collapsed. I grew about sixty varieties, some on ground that had been trenched, and some on land merely dug over. So far as I could gather no sweet peas had been grown on the land previously. The plants did very well after being planted out, but before long there came a spell of dry, cold weather, and growth was checked. Then followed wet weather, not overmuch rain, but dull wet weather, and growth progressed fairly well. Then we had a spell of sunshine, ten days or a fortnight of summer weather, and the sweet peas fairly jumped along. There was some bud dropping, but not much, and presently the rows were a grand sight, such varieties as Marjorie Willis, Asta Ohn, Evelyn Hemus, Mrs. C. W. Breadmore, Clara Curtis, Kitty Clive, Mrs. H. Bell, Lord Nelson, Helen Lewis, The King, and Etta Dyke looking particularly well, and giving spikes of four flowers each in great profusion. We cut and came again for about a week, and then a few plants here and there turned yellowy, and shrivelled up like straw. These were pulled up and burned, but, alas, within ten days from the time the sweet peas were "an ocean of loveliness," they had become a veritable "slough of despond."

Those who had similar experience condoled with me. Mr. Chittenden opined that physiological disorder was the cause of trouble, and that Thielavia besicola found on the roots of similar specimens could hardly be regarded as the real cause of failure. Mr. Massee was of similar opinion. Those who had not my tragic experience (of course, I should have wrested the championship from Mr. Stevenson but for this collapse), expressed regret, and nodded their heads in an exasperating fashion, as if to suggest that had I known better (as they did) this thing would not have happened. One Midland seedsman, well known for his vegetable stocks, was kind enough to say, "Well, well, a man may be a very excellent secretary of a society, but have no practical experience of the flower that society is formed to encourage." This took my breath away, and he was gone before I could humbly suggest that for the last fourteen years I have never grown fewer than two dozen varieties, and good rows and clumps of each, and that the number has been mostly from forty to eighty varieties.

High breeding has no doubt affected the constitution of sweet peas. By this I mean that the newer varieties have not, as a whole, the stamina that will withstand untoward climatic conditions as had the earlier varieties. Enormous growth and great spikes do not necessarily mean a hardy, virile constitution. High breeding and bad weather were the cause of failure, and very few growers, trade or amateur, entirely escaped the trouble. Those with open gardens and fields, and wide set rows, where there was the greatest possible circulation of air, seemed to escape the best.

But there were some wonderful flowers at the leading exhibitions, both from autumn sown and spring sown seed. Mr. Stevenson, Mr. T. Jones, Mr. Hopkins, Mr. Basile, Mr. Usher, and Mr. Prophet were in fine form, to mention only a few, and probably no finer flowers were ever seen than those Mr. Stevenson displayed at the London Show of the National Sweet Pea Society. Sweet peas were a good feature at the Temple Show in May, and they were leading attractions at Woodbridge, Southampton, Leicester, Luton, Wolverhampton, Cardiff, Hanley, Edinburgh, Carlisle, York, Gloucester, and Shrewsbury. At Saltaire the display fell short of expectations in the matter of extent.

The National Sweet Pea Society had a successful year, raising its membership well on towards the thousand, and attracting to itself about one hundred affiliated societies. It did well financially. The work of its Floral Committee is to the great advantage of the general public, but the bracketing of certain varieties as too much alike has not been accepted with very good grace in some quarters. If all seedsmen and raisers would conscientiously accept the findings of the society, based as these are on the society's independent and extensive trials, they would directly benefit themselves. The past season suggests that registration of new varieties is a matter of pressing importance and that nomenclature is a serious problem. Under present conditions, the multiplication of names for varieties that present only such differences as exist between Tweedledum and Tweedledee can only lead to one end, and that will be a slump in named varieties and an enormous loss to the trade. The intense loyalty of some firms and raisers to the society is a splendid thing; I hope it will prove infectious. If the greatest good for the greatest number is kept in view then the sweet pea trade may hope for a long and successful future. Selfishness will soon kill the goose that is now laying golden eggs.

The Sweet Pea Conference, following the annual meeting of the N.S.P.S., was another fine feature of the sweet pea year now gone. The good spirit permeating the remarks made during a brisk discussion was good to feel, and promises well for future events of a similar character. The decision of the society to add a beautifully executed certificate to the silver medal granted to affiliated societies should draw the children closer to their parent, and also increase the family. The further decision to investigate sweet pea diseases should be the means of attracting many new members.

The keenness with which the firm of Vilmorin is taking up sweet peas in France; the formation of a National Sweet Pea Society in the United States, with trials of its own at Cornell University; the fact that one town in the Western States gives itself up to a huge sweet pea fête for a couple of days or so; the proposal to form a National Sweet Pea Society in New Zealand; and the increasing number of affiliated societies, all point to the great and wonderful popularity of sweet peas, and prove, notwithstanding its many drawbacks, that the sweet pea year of 1909 was a good one.

Charles H. Curtis.

Ampelopsis Veitchi.—Our botanical friends have "fairly done it" this time. For the future this popular climber is to be known by the name of Parthenocissus tricuspidata. After running the gamut through Ampelopsis Veitchi, Ampelopsis tricuspidata, and Vitis inconstans, the correct name according to the December number of the "Botanical Magazine" is Parthenocissus tricuspidata. Whatever prompts this continual chopping and changing about puzzles the average gardener, who is often completely at sea with the latest thing in names. Neither euphony nor brevity can be urged in favour of this last change, and as a plain gardener accustomed to call a spade a "spade" I only voice the opinion of many others who regard these changes as an attempt to baffle all those outside the sacred circle of botanists. With the vast number of plants in cultivation a good deal of application is necessary in order to acquire a fair knowledge of many of them, and with this persistent changing of names the work is greatly increased. We have quite enough to do without unravelling puzzles which this sort of thing sets us. It is to be hoped that to-morrow some other botanist of sufficient weight will give us a more simple name before we have had time to commit to memory the unwieldy one of Parthenocissus tricuspidata, or will tell us that Ampelopsis Veitchi is, after all, the right name!—A Gardener.

SAXIFRAGA APICULATA.

It has been frequently remarked that the genus Saxifraga is so rich in species and varieties that one might easily clothe a large rock garden by their agency, as the majority of them have distinct merits, and an irresistible charm invests nearly all of them, irrespective of their flowers.

The species under notice is a plant of common occurrence in many gardens, being easy to grow and most reliable in flowering. Like a few others, its generous nature in this latter respect is not fully recognised, as among the earliest spring-flowering species it is perfectly distinct, particularly so in regard to the colour of the flowers, which are of a soft shade of lemon. The individual flowers are in clustered heads upon short stems about three inches in height, the colouring of the flowers is in marked contrast to the deep green, close-set branches, whose stems and bristling leaves form a dense carpet, which at all seasons is pleasant to the eye.

Saxifraga apiculata is a plant of fairly rapid growth, at least in so far as this term is applicable to these diminutive alpines; it grows with marked vigour upon strong limestone soil, flowering most profusely where it is fully exposed to sun. It prefers a well-drained position, a compost of grit and limestone soil, and no overcrowding by stronger neighbours. Once fairly established, the bristling spiny growths push out on ever side, so that in a comparatively short time it forms a patch several feet in circumference. A large mass of Saxifraga apiculata, with its primrose flowers, adds greatly to the interest of the spring garden, and where broad effects are desired in preference to varieties this species should by no means be overlooked.

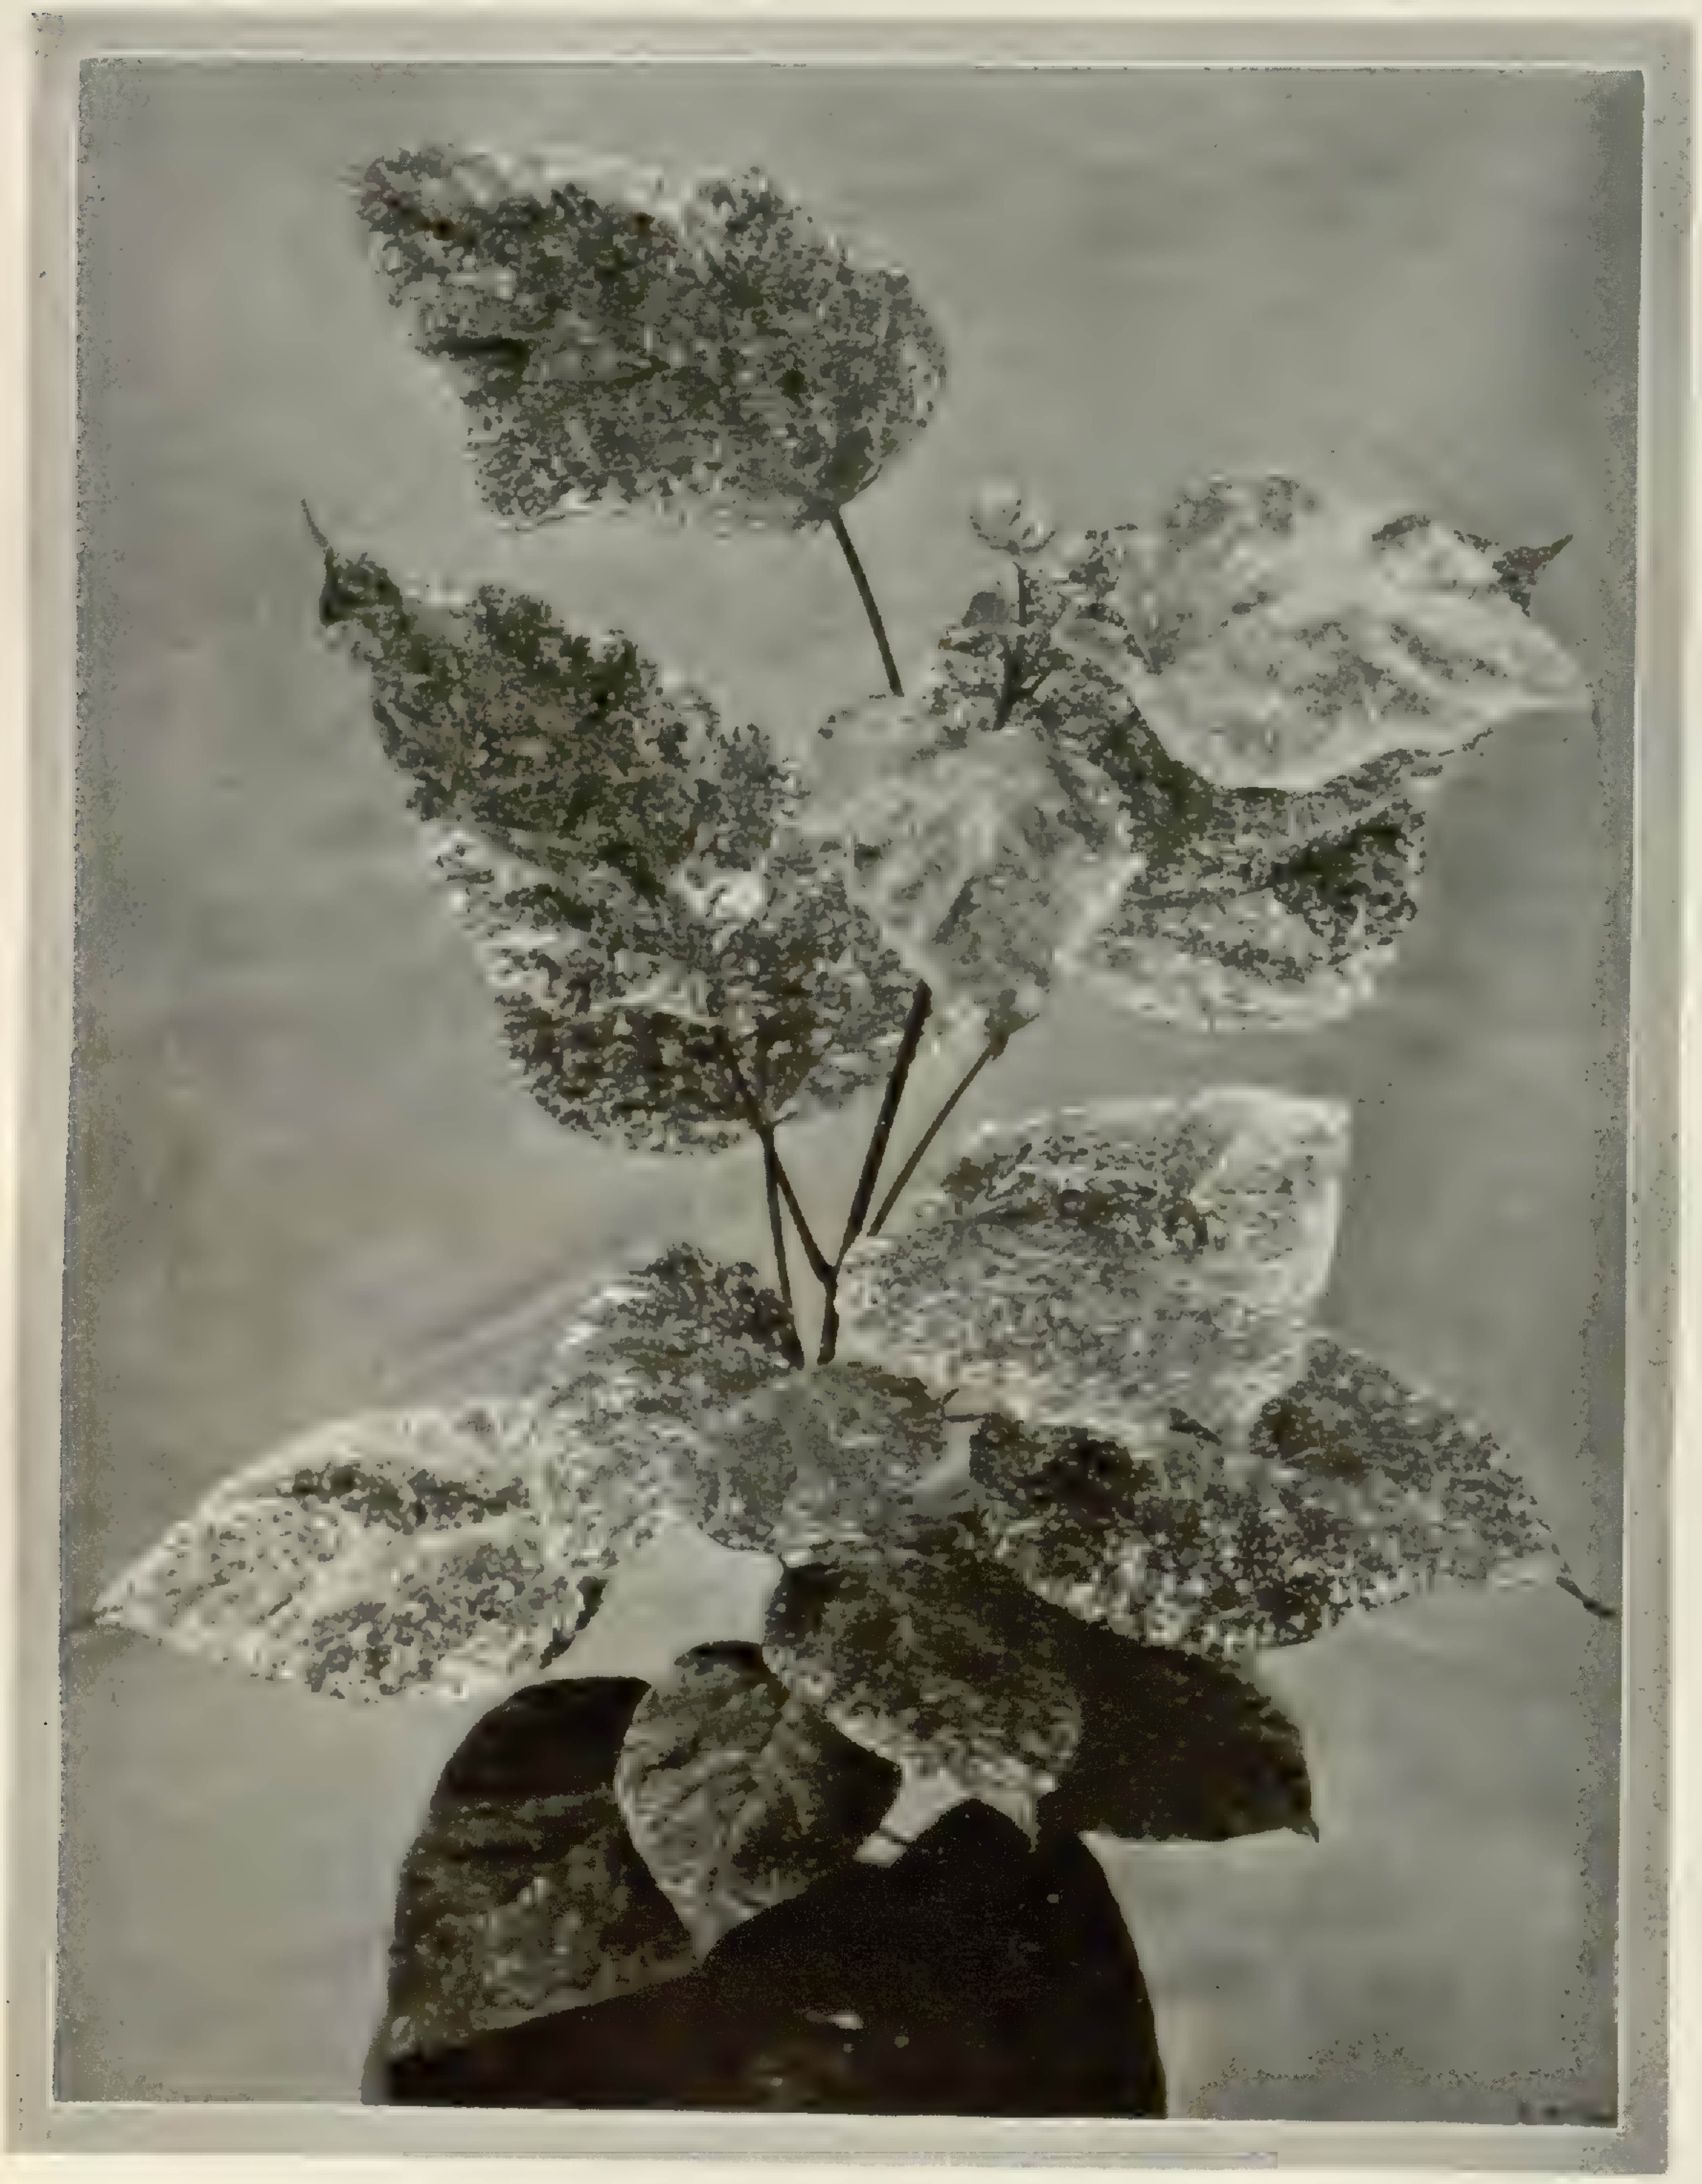
NEW PERPETUAL CARNATION EMPEROR.

A distinct variety, with crimson-flaked flowers, raised by Mr. Lancashire, Victoria Vineries, Guernsey.

NEW HARDY TREES AND SHRUBS OF 1909.

Last year, in my review of the hardy trees and shrubs (exclusive of roses) that had during 1908 received either First Class Certificates or Awards of Merit from the Royal Horticultural Society, I remarked that, compared with 1907, there had been a decided falling off. In 1909 the decrease still continued, the numbers being two First Class Certificates and only four Awards of Merit, while in 1908 it was two Certificates and eight Awards of Merit. The previous year (1907) there were three Certificates and fifteen Awards.



CATALPA SPECIOSA PULVERULENTA.
A distinct variety, with leaves freely speckled with cream-white; introduced by Messrs. Paul and Son.

Of the limited number of those honoured in 1909 the most notable feature is that Chinese shrubs are again strongly represented, most of them being the result of Mr. E. H. Wilson's travels in China. The complete list is as follows:

Viburnum Carlesi.—A beautiful species of viburnum; its flowers, borne in rounded heads, are individually larger than those of the laurestinus, and are very fragrant. The colour of the expanded blossoms is white, but the buds are reddish. It is a deciduous species, and though a native of Corea, is quite hardy. An Award of Merit was given to this on April 14, 1908, at which time it was figured in the Gardeners' Magazine. Last year, that is to say, on May 4, 1909, the Award of Merit was increased to that of a First Class Certificate.

Hydrangea Hortensia alba.—A pure white variety of the common hydrangea, which should become a popular plant for decorative purposes, as it is more robust than the variety Thomas Hogg, which has been generally grown for the sake of its pure white blossoms. Exception may, perhaps, be taken to including this with hardy shrubs, as Hydrangea Hortensia is so generally grown for indoor decoration, still, in many districts it is exceedingly valuable solely as an outdoor shrub. An Award of Merit was given to the variety alba on May 4.

Rhododendron Souliei.—Another new Chinese rhododendron, for which we are indebted to the Messrs. Veitch. Judging by the specimen exhibited, it is quite a dwarf plant, which, being quite hardy, should be valuable as a rockwork shrub or for similar purposes. Though the plant shown was under a foot in height, it is of sturdy growth, clothed with ovate leaves, cordate at the base, and of a firm leathery texture. They are when young of a reddish tint, as well as the young shoots, and also have a glaucous bloom, which soon disappears. The flowers, borne in a neat truss, are comparatively large, being almost four inches in diameter, and of a rose-pink colour. They are flatter than those of most rhododendrons, in fact they are in shape somewhat suggestive of those of a kalmia. A First Class Certificate was given to this rhododendron on May 18, a distinction which, in the opinion of everyone, was well merited. Rhododendron Souliei is a native of Western China, where it occurs at altitudes of 9,000 to 11,000 feet. It is there said to vary in height from three to twelve feet, which latter stature will take a long time to attain. A lifelike illustration of this charming new shrub is given in the Gardeners' Magazine for May 29, 1909. It has not yet, as far as I know, been put into commerce.

Spiræa Veitchi.—An exceedingly floriferous shrubby spiræa, of very graceful habit. It is a shrub which will reach a height of six feet to eight feet, or even more, and pushes out long gracefully arching shoots, which are, during the flowering season, thickly studded on the upper surface with clusters of white blossoms. An illustration of this spiræa, showing well its main characteristics, may be found in the Gardeners' Magazine for July 31, 1909. It is a native of China. An Award of Merit was given to Spiræa Veitchi on July 20.

Rhus sinica.—This comparatively new sumach, from China, is not much known. Its general appearance may be seen from the small specimen figured in the Gardeners' Magazine for September 18 last. The compound leaves of this species are from eighteen inches to two feet in length. The leaflets in summer are of a deep green colour, with reddish stalks and principal veins. Like other of the sumachs, the foliage in autumn changes to an orange-red colour, in which state it is wonderfully effective, and should form a striking feature on a lawn. This rhus was given an Award of Merit on September 14.

Vitis Wilsonæ.—Another of the new Chinese vines, and one somewhat after the style of Vitis armata. It is one of the large-leaved species, and a decidedly ornamental one. The leaf is almost regularly five-sided, while the margins are nearly entire. All the principal veins, however, terminate with a slight point. The leathery leaves change to a bright crimson in autumn. An Award of Merit was given this vine on September 28.

Catalpa speciosa pulverulenta.—During the year a distinct variety of Catalpa speciosa was introduced by Messrs. Paul and Son, of the Cheshunt Nurseries, and when it becomes more fully developed will not fail to obtain recognition. The leaves are of the usual size, and freely speckled with cream colour. W. T.

GARRYA ELLIPTICA AS A LAWN TREE.

This evergreen is usually regarded as a good wall plant for western and northerly aspects, where many choice subjects are considered to be unsuitable, or do not succeed. But as a specimen on the lawn this garrya is a handsome subject, especially if shelter from north and easterly winds can be given it, and it is carefully pruned after flowering to keep it in shape, and thus provide it with a greater density of leaf than is usual if it is allowed to grow away uninterruptedly.

On the lawn at Herriard Park I recently saw an extremely fine plant. Two years since the plant was 12 feet high, and had a circumference of twenty-two feet; when thickly loaded with catkins it makes a fine sight in December. Herriard Park is fully 600 feet above sea level.

THE NEW ORCHIDS OF 1909.

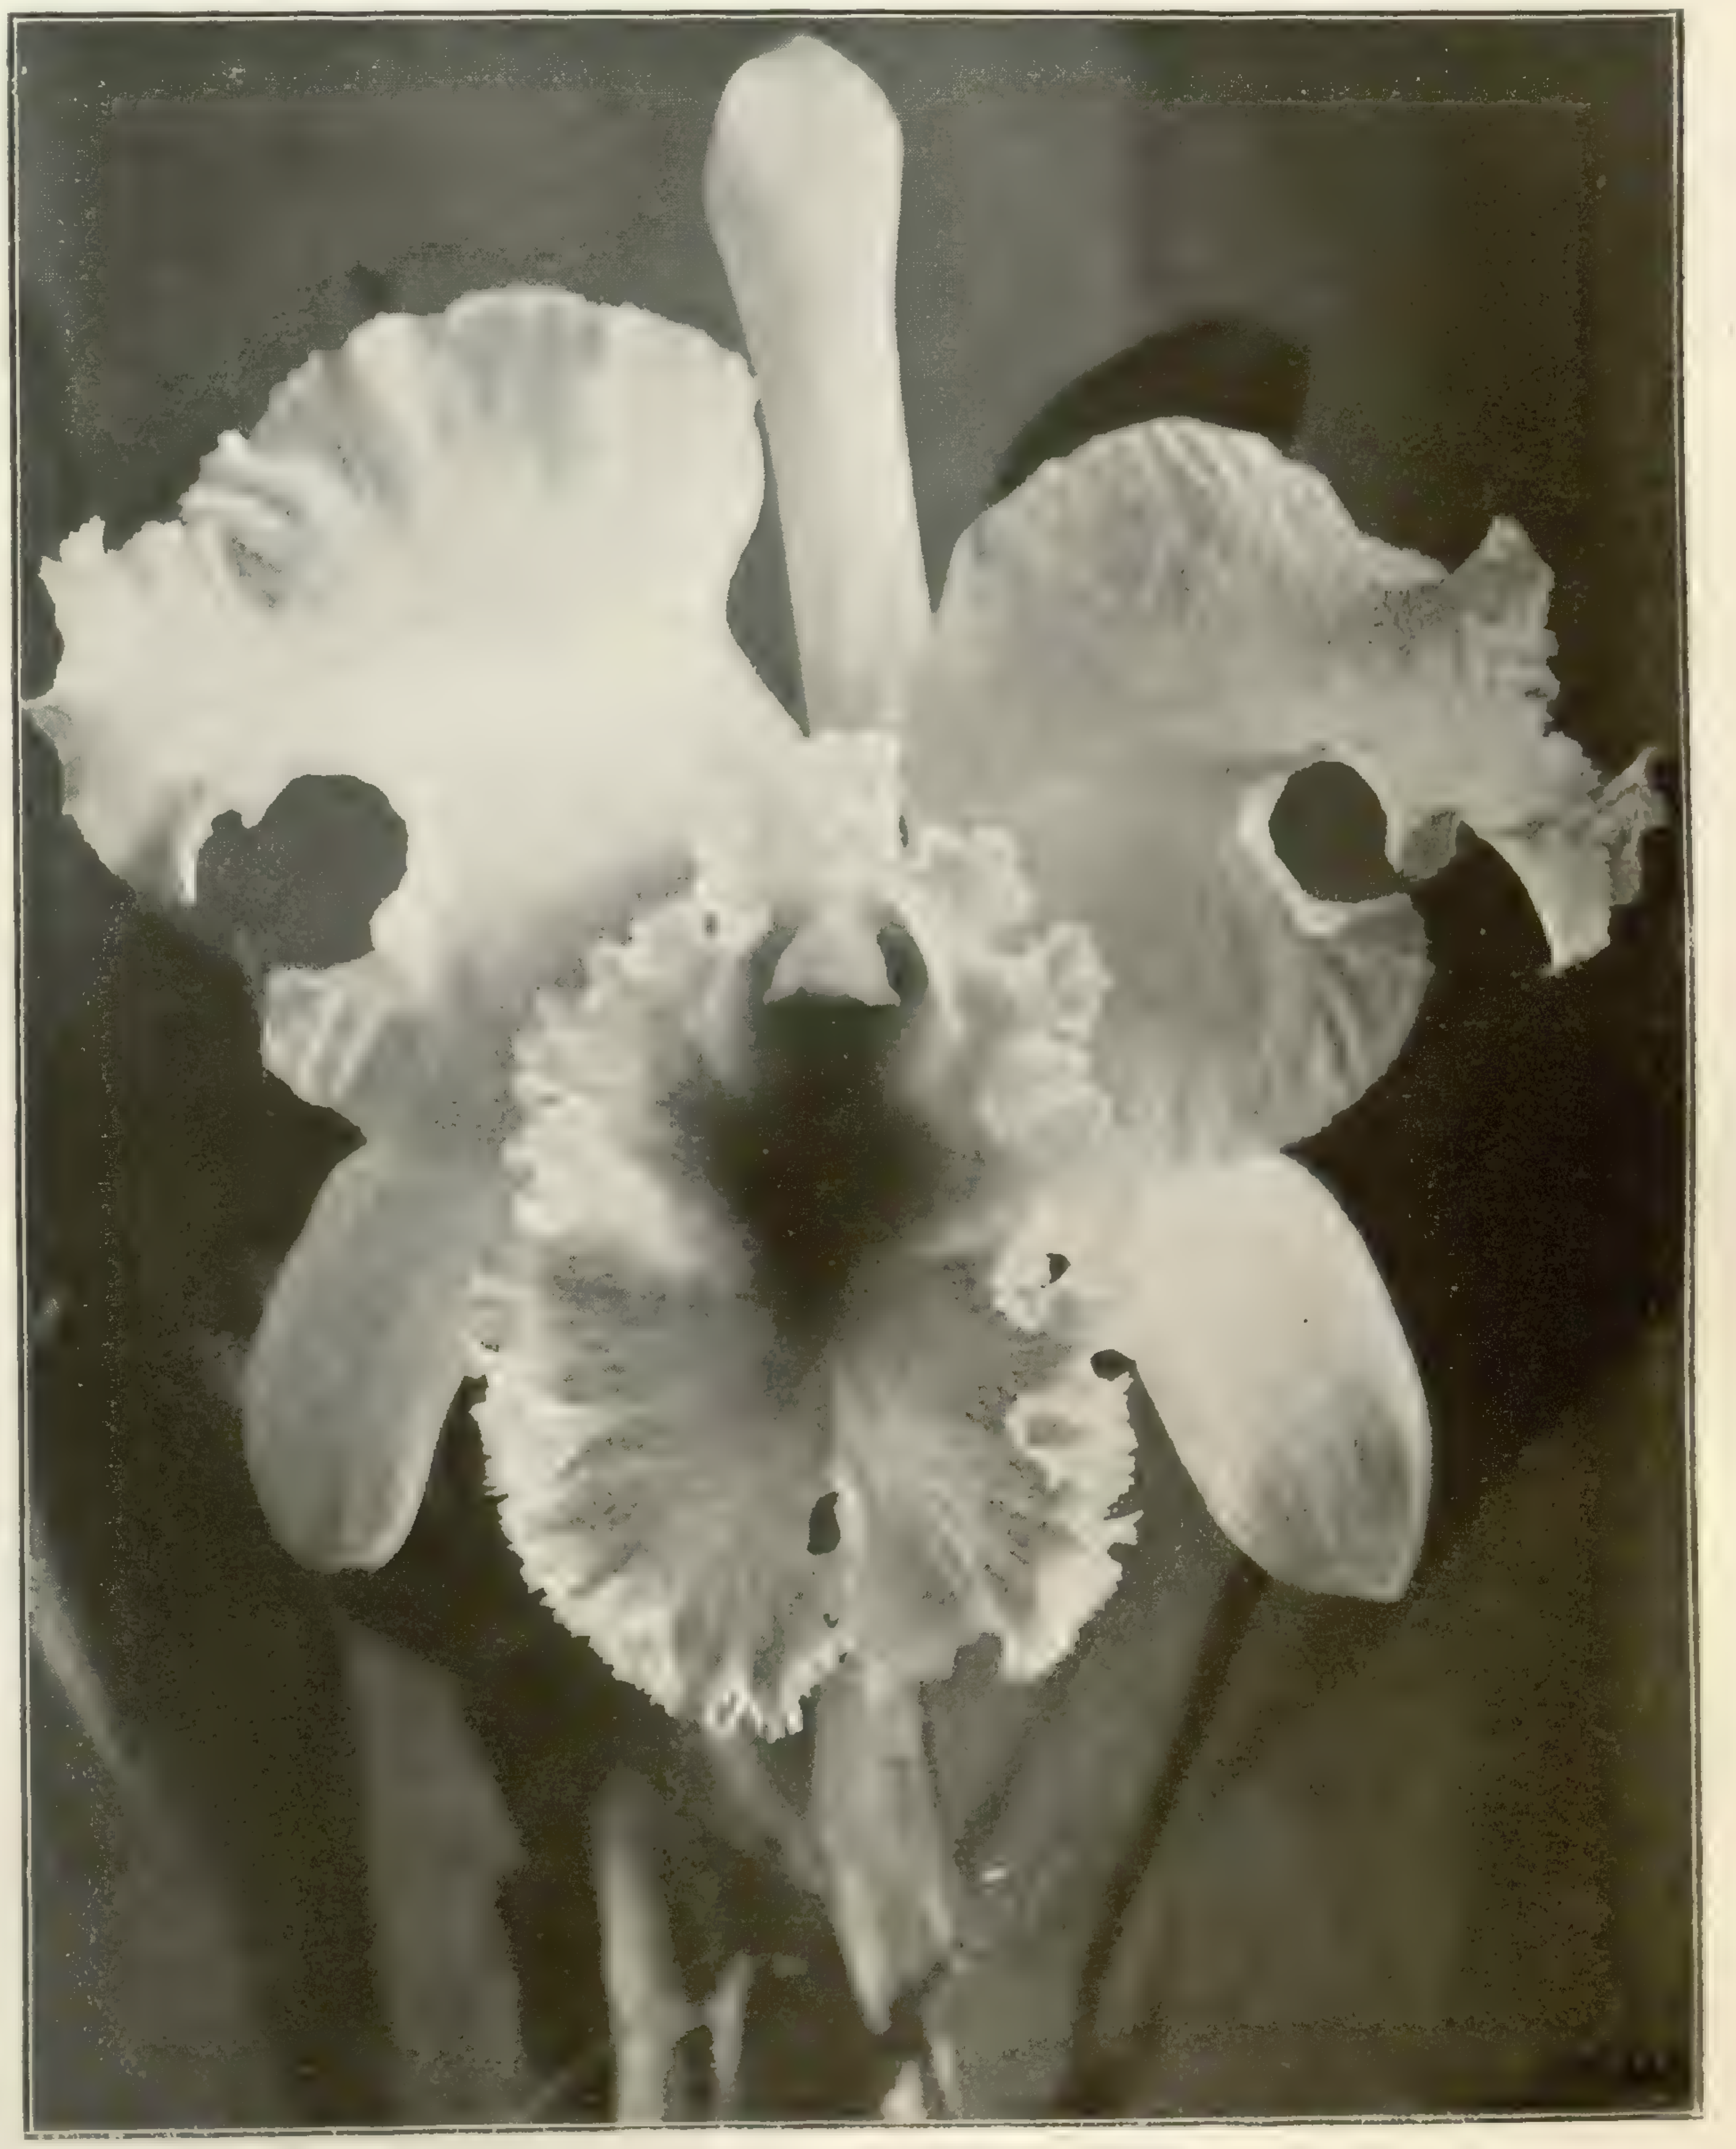
Quantities of new, or presumably new, orchids were placed before the members of the Orchid Committee during the year 1909, and at some of the meetings the business proved long, and somewhat tedious. Here, as in the case of other flowers that become popular and valuable, there are not a few people who believe their own geese are as fine as most people's swans, and so large numbers of plants are put forward that stand no chance of recognition, but these have to go the round of the table and be inspected by every member. A high standard of form is now required in a new cypripedium, and if a flower has a narrow-based dorsal sepal it must have some remarkable points in colour or size to obtain an award. The lælio-cattleyas, too, multiply apace, and have to be of very fine form or distinct colouring to pass muster.

In some cases awards or certificates are granted at a meeting, but subsequently withdrawn because the owner did not submit a flower for the purpose of having its portrait painted. At each meeting the society's collection of orchid paintings is at hand, and all varietal forms of hybrids are judged in the light of these portraits of their older and certificated brethren. I believe thirty-nine First Class Certificates, fifty-three Awards of Merit, and four Certificates of Appreciation were granted during 1909. The orchids that gained these awards have been described, and, in many instances, figured in the pages of the GARDENERS' MAGAZINE, and the abridged descriptions, together with those of orchids figured in the "Botanical Magazine," are brought together in handy alphabetical form in the "Gardening Year Book for 1910."

Varieties of cattleyas were fairly numerous, and one outstanding variety was the beautiful C. Schroderæ The Baron, from Lieut.-Colonel Holford's collection. Lælio-cattleyas were also prominent, and a few of the best were L.-c. King Manoel (Wellesley), L.-c. Nelthorpe Beauclerk (Charlesworth), L.-c. Barbarossa Westonbirt var. (Holford), L.-c. Dr. Schiffman Westonbirt var. (Holford), and L.-c. Firmini (Lambeau). Besides these there were the exquisite yellow and golden lælio-cattleyas such as L.-c. Gold Crest, L.-c. Goldfinch superba, and L.-c. Golden Oriole Westonbirt var., all from Lieut.-Colonel Holford's collection, and all of delightful colour and freedom, although lacking something in breadth of petal and form, and, perhaps, all the more elegant as a consequence.

Dendrobiums have not been so obtrusive among new orchids as was formerly the case, but there were two species introduced that caused a small sensation; these were the fine D. Sanderæ, from Messrs. Sander and Co., white, with rosy lip; and D. acuminata, from Messrs. Moore, Lim. (now Messrs. Mansell and Hatcher), with a long spike of pink flowers. The hybrid Dendrobium atro-Brymerianum (D. atroviolaceum crossed with D. Brymerianum), raised by Mr. Thwaites, was a striking and novel orchid, and to it was granted the first Certificate of Appreciation—a new award. Cirrhopetalum longissimum, shown on November 3, by Sir Trevor Lawrence, Bart., will long be remembered for its grace and beauty.

Odontoglossums were presented in fairly good numbers, but here again the high standard set up is not often reached. Mr. De Barri Crawshay is to be ocngratulated upon his O. Theodora, a delightful cross between O. Rossi majus and O. triumphans. O. ardentissimum Phœbe, from Mrs. Cockson's collection at Wylam; was another very beautiful orchid, while Mons. Vuylsteke's splendid hybrids, O. mirum Emperor of India, O. Princess Victoria Alexandra, and O. Aglaon, each of which gained a F.C.C. at the Temple Show, were of unusual beauty.



BRASSO-CATTLEYA CLIFTONI MAGNIFICA.
F.C.C., R.H.S. March 9, 1909. Messrs. Charlesworth and Co. Flowers considerably reduced, sepals and petals white, tinted rose, the lip crimson.

Among bigeneric hybrids Messrs. Charlesworth and Co.'s Miltonioda Harwoodi is the latest advance. Odontiodas have multiplied, and foremost among them is O. Bradshawiæ Cookson's var., with flowers of large size and brilliant colouring. O. Lutetia, from Messrs. Charlesworth and Co., derived from Odontoglossum luteo purpureum and Cochlioda Noetzliana; O. Grairiana, from O. Rossi majus and C. Noetzliana, and exhibited by Mons. H. Graire, of Amiens; O. Ernest Henry, shown by Mr. H. S. Goodson last April—O. Queen Alexandra crossed with C. Noetzliana; O. Keighleyensis, a small-flowered bright scarlet hybrid, raised by Messrs. Charlesworth between O. cirrhosum and Cochlioda Noetzliana; O. Keighleyensis Fowler's var., a brilliant orchid, exhibited by Mr. J. Gurney Fowler at the last meeting of the old year; and O. Vuylstekeæ Crawshayana, Mr. Crawshay's hybrid between O. Pescatorei and Cochlioda Noetzliana.

Other bigeners of note that appeared during 1909 are Brasso-cattleya Cliftoni magnifica, shown by Messrs. Charlesworth and Co., on March 9, and regarded as one of the finest cattleyoid orchids of the year. Mr. Thwaites raised two new Sophro-cattleyas, i.e., S.-c. Thwaitesi (Sophronitis grandiflora crossed with Cattleya Mendeli), and S.-c. Blacki, derived from S. grandiflora and C. Hardyana; both are very interesting and pretty hybrids. Two Sophro-lælio-cattleyas appeared, S.-l.-c. Olive coming from Mr. Gurney Fowler, and S.-l.-c. Marathon var. Vesuvius, from Messrs. Charlesworth and Co.

Comparatively few cypripediums secured awards, and the most distinct of these are C. Boltoni, from Mr. Bolton; C. Our Queen, from Mr. W. Thompson; C. Faire-Maide, from Mrs. Cookson; C. The Lion and C. Mrs. F. Sander, from Messrs. Sander and Sons; C. Cynthia and C. Earl of Tankerville, both from Lieut.-Colonel Holford. Two new oncidiums have to be recorded, O. Charlesworthi, a fine species of the O. crispum group, which attracted a great deal of attention at the Temple Show; and O. hybridum, raised by Messrs. Charlesworth and Co.

From this brief summary it will be gathered that new species of orchids rarely appear, but the hybridists are very busy, especially among cypripediums, cattleyas, lælias, and odontoglossums, in their endeavour to add to bigeneric and trigeneric hybrids.

C. H. C.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

THE COOL HOUSE.—The different species and hybrids of odontoglossums will, in the majority of cases, be now in their most vigorous stage of growth. It is while in this condition that, in my opinion, they need the most encouragement. I have often seen it contended that a temperature of from 40 to 45 degrees is ample for the odontoglossum house during the winter season, and I do not wish to contend that the plants cannot be grown in such a low temperature during the winter months, because it is quite possible; but plants grown under these conditions, in practically all cases, show the result of such treatment in their stunted appearance. If we treat the plants more liberally we find growth becomes more robust, and we are able to procure growths and pseudo-bulbs, often much larger than those found on fresh imported plants. It is all very well to permit the temperature to fall to the degrees mentioned during periods of severe frost and extreme outside conditions, and less injury will probably occur to the plants under these lower readings of the thermometer than if excessive artificial heat is used in the endeavour to maintain the temperature at a higher degree; but with normal conditions prevailing outside we find that considerable advantages are derived from a temperature of 53 to 55 degrees at night, this permitting a fall of three or four degrees, so that the temperature of the house rarely falls below 50 degrees during the winter.

BETTER CONDITIONS. — With the higher temperature we are able to give the encouragement necessary at the period when the plants are in their most active state, and when they are producing their flower scapes. As the season advances every facility should be given to assist the plants in hardening and ripening their growths and pseudo-bulbs. It is often contended that flowers of better quality are produced from the smaller pseudo-bulbs than from large ones. This is quite possible, for unless we have the larger and more robust growths thoroughly matured, they fail to produce satisfactory results. It is only natural that plants grown under warmer conditions will be of a more succulent nature than those of the same kind grown cooler, and it is utterly impossible to produce satisfactory flowers unless we obtain maturity. Light and free ventilation are the chief factors to be employed in producing these desirable results. In the early weeks of the new year no shading whatever is necessary in the cool divisions, but there is more risk of danger from too much bright light when the days are lengthening than is the case during the closing months of the year. The plants having been now for some weeks without strong light are naturally of a softer nature than was the case after the summer and autumn season, and they are thus unable to withstand without injury, the rapid increase of light which takes place when the year is only a few months old, and the atmosphere is clear. Shading naturally requires close attention, or the older bulbs and foliage will become discoloured, for the excessive bronziness of the foliage will generally be found disadvantageous in the end, as such plants usually shed their leaves at an early period, and loss of foliage does not add to health or appearance.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

PRIMULAS.—Primulas coming into bloom will be benefited by weak liquid manure, which may be increased in strength in a few weeks' time. Seeds should be sown now of Primula sinensis, and P. obconica in variety; as soon as the seedlings are fit to handle, prick them off into 2½in. pots or in boxes, in good loam, peat, and sand in equal parts. Keep the seedlings near the glass. To secure some large plants for special purposes keep a few of the old ones, and grow them in a cool frame during the summer.

ZONAL PELARGONIUMS.—Give very little water to plants in bloom, as these will do better if kept rather dry. Those in 3-in. pots should be shifted into 5½-in. or 6-in. pots, to follow the winter blooming stock. Where there are cuttings in boxes, keep these on a shelf and pick all dead leaves from them regularly. If kept at all wet these are liable to damp off. Begonias that were late in flowering should be examined and stored away in a dry cool place. Cyclamen in flower, and those coming into bloom, should receive plenty of light and air. Another sowing of seed should be made to provide successional batches.

HIPPEASTRUMS.—These should be examined and a few selected for an early start. Any that were late in flowering and have seed-pods on should be carefully watched, and as soon as the seed-pods are ripe sow the seeds at once, and keep the seedlings growing steadily until they flower, which will be in about two and a-half years from the time of sowing.

CHRYSANTHEMUMS.—Those in the conservatory should be very carefully watered. Keep everything as fresh and clean as possible. A batch of the strongest cuttings should be inserted as these mean better flowers in the autumn.

MALMAISON CARNATIONS. — Give plenty of light and air on all suitable days, and if any rust is noticed, pick every leaf infected and burn in the furnace. As soon as rusted plants have done flowering throw them in the furnace. Plants in small pots will be better for a shift into 5½-in. pots. If any cuttings can be obtained insert these in small pots singly, and keep them in a hand-light until rooted, afterwards giving plenty of air. These will give some good blooms in late autumn, when the flowers are becoming scarce.

WINTER-BLOOMING CARNATIONS.—Give plenty of air to these, and fumigate them once in three weeks, for once green-fly attacks carnations severely the plants look very bad all the season.

HELIOTROPIUMS in the conservatory, growing up pillars or in corners, should be now cut hard back, as they will very soon grow again. As soon as the new growths are long enough make use of them by inserting six or seven in a 4½-in. pot, and when rooted, pot off singly. These will be found useful when bedding-out time comes round. —W. STAWARD, Belford Hall Gardens.

THE FLOWER GARDEN.

ALPINES or other hardy or half-hardy plants that are being wintered in pits or frames should be occasionally examined, and have all decayed or decaying portions removed. With many choice subjects, a light dusting of black sulphur over the affected parts will greatly minimise the risk of losses from damp. In most instances it is safer—during the dull days of January—to keep these subjects somewhat dry at the roots, but any risk from shrivelling should be carefully guarded against. It is just as well at this time of the year to carefully and systematically label all hardy plants held in reserve for the Alpine or hardy flower garden, as nothing causes greater confusion at planting-out time than worn-out or illegible labels. Pinks and carnations that were potted up during the autumn or early winter months, and are under protection, should have abundance of air on all favourable occasions, especially where the situation is damp. Weather permitting, anemones and ranunculi that were not planted in the autumn, should be attended to without delay; on light soils, however, this should have been done long since.

GENERAL REMARKS.—Neatness in the flower garden is an important factor at this season of the year, and the remarks apply equally to the shrubberies and borders. The transplanting, or the removal of shrubs and other subjects that have become overcrowded, should be carried out, for it is a mistaken policy to delay these operations if climatic conditions are at all favourable. Complete thoroughness in the perfomance of this kind of work alone can insure success, and is a matter that can only be left in the hands of those qualified to deal with it, and not to an ordinary garden labourer, who, more often than not, cares little or nothing about his employer's interests or his chief's reputation.

CLIMBING PLANTS growing on walls, arches, or pergolas, should be secured against rough winds and snowy weather, otherwise serious losses and breakages may occur. Bulbs and tender plants should be mulched or otherwise protected during severe weather, especially on cold and heavy soils. All vacant borders and beds should be dug or trenched, and gaps in the herbaceous borders be made good. If not already done, autumn-planted shrubs should be amply protected against extreme frosts or cold, cutting winds, bracken fern, half-decayed leaves, or litter of almost any description placed over the roots, will prevent the admission of frost and keep the soil near the roots at a more equable temperature; in some instances it may even become necessary to protect with mats or straw during very inclement weather, removing these upon the cessation of extreme cold, or the advent of showery weather.

BEDDING PLANTS should be examined forthwith, and all insect pests destroyed by fumigation or other means, before propagation is proceeded with. Do not unduly excite these subjects by submitting them to too high a temperature, and air should be given in abundance whenever possible. If not already done, a list of all seeds required for the flower garden during the forthcoming season should be made out and despatched to the seedsman. Early attention to this matter will prevent delays and disappointments during the busy season. In all instances—where possible—order enough and a little to spare, to provide against accidents and climatic disabilities. Nothing is gained by parsimoniousness when dealing with the seed order, a point that should be remembered by those directly responsible.—W. HEDLEY WARREN, Aston Clinton Gardens.

HARDY FRUITS.

GENERAL WORK.—The pruning of hardy fruit trees in the open quarters should be pushed on without delay. In pruning young trees of apples and pears, the leading shoots that are required for extension should not be shortened too much, as when well ripened no wood breaks into bud with more freedom than these two kinds of fruit. The object to aim at in pruning should be to build up good trees as soon as possible, furnished with bearing branches down to the ground. If any grafting has to be done later on, now is the time to select well ripened shoots, tie them in bundles, with their proper names attached, and place them in the soil under a north wall until required for use. In many localities the pruning of gooseberry bushes should be deferred till late in the spring, owing to the depredations of birds. At this time select cuttings of gooseberries and currants for propagation, which should be about one foot in length. The buds of gooseberries and currants (red and white) should be removed with a sharp knife to the height of nine inches from the base of the stems, but no buds on the cuttings of black currants should be cut out, as these eventually throw up growths from the base and ensure plenty of young fruiting wood.

WALL FRUITS.—The work of pruning wall trees should be carried on as expeditiously as possible. Before tying or nailing apples, pears, and plums on walls, the trees should be well sprayed with a good winter wash to cleanse them from lichen, moss, insects, and their eggs. We use here as a winter spray a caustic alkali solution, made from 1lb. of caustic soda, ¾lb. commercial potash, 10oz. of soft soap, and 10 gallons of water heated to 120 deg. Fahr. This is applied as a spray, taking care to wet all the twigs and branches. The hands should be well protected

By Special Appointment to His Majesty the King.

G. H. MACKERETH, Seedsman, ULVERSTON.

with rubber gloves during spraying operations. As a winter wash for peaches, nectarines, and apricots, use a solution of soft soap and water, with a little flowers of sulphur added. Spraying operations should not be carried out when there are any indications of frost. The work of refastening peach and nectarine trees should be deferred for some weeks yet; after pruning and cleaning the trees, the branches and twigs should be tied up in loose bundles and firmly secured to the wall, as this will materially retard the flowering period and prevent damage from spring frosts.

GROUND WORK.—If the soil is in a good working condition it should be lightly forked over in and around fruit trees as the work of pruning is completed.

PREPARATION FOR PLANTING.—The ground for planting fruit trees is usually made ready early in the autumn, so that the trees may be planted before the New Year. Where circumstances would not allow this being done, the work should be taken in hand at once. If possible, the soil should be trenched to the depth of 3ft., and if of a very poor character, a little well decayed manure, wood ashes, and soot should be added as trenching proceeds. This operation entails time and labour, but the results amply repay the labour thus involved.—Henry R. Farmer, Cardiff Castle Gardens.

Chrysanthemum Miss Hilda Rowley.—With the exception of blooms at Edinburgh I have not seen this Japanese variety exhibited in good condition until last season, when, at York, Mr. Vert staged an exceedingly fine bloom of it, measuring nine inches in diameter and fully eight inches in depth, with a perfectly-filled centre, the florets radiating in a half-drooping character making a most graceful blossom. The colour is pleasing, a rich shade of silvery amaranth. I would strongly advise those growers who have not hitherto done so, to give this variety a trial.—E. M.

THE QUAMASH.

The Camassia, or Quamash, is a good summer-flowering bulb, not much cultivated in the garden of the amateur, but deserving of a little more consideration than it has hitherto received at his hands. It is a hardy bulbous plant of much beauty and distinctness, giving spikes of good flowers in May or June. I find that the camassias are best in rather damp places, and there they will live for many years. Among the best of those in cultivation are:

Camassia Cusicki, which is a fine grower, reaching, in good soil, three or four feet in height, and giving from amid pretty glaucous foliage, spikes of closely-arranged pale blue flowers. One of the most handsome of all.

Camassia esculenta is the best known in gardens, and its bulbs were at one time, and may still be for anything I know, eaten by the North American Indians. It grows about three feet high, and has fine spikes of rich blue flowers set above fine glaucous green leaves. It seems to flourish in damper places than the others, and there is really fine.

Leichtlin's Quamash (Camassia Leichtlini), as at first introduced, is not at all plentiful, the flowers being of a pretty creamy white, and growing about two feet high, or a little more when in a damp place. There is a very beautiful white variety called alba, with purer flowers and of bolder growth, reaching sometimes as much as four feet high, but usually a little smaller. Then a good blue variety is called atrocærulea, and this has very dark blue blooms. Then there are to be purchased mixed seedlings of this species, with flowers that vary from deep blue through pale blue to white. These are highly ornamental, and worth growing at the price they cost.

These camassias will grow in common loam, and may be planted with the tops of the bulbs three or four inches deep.

S. Arnott.

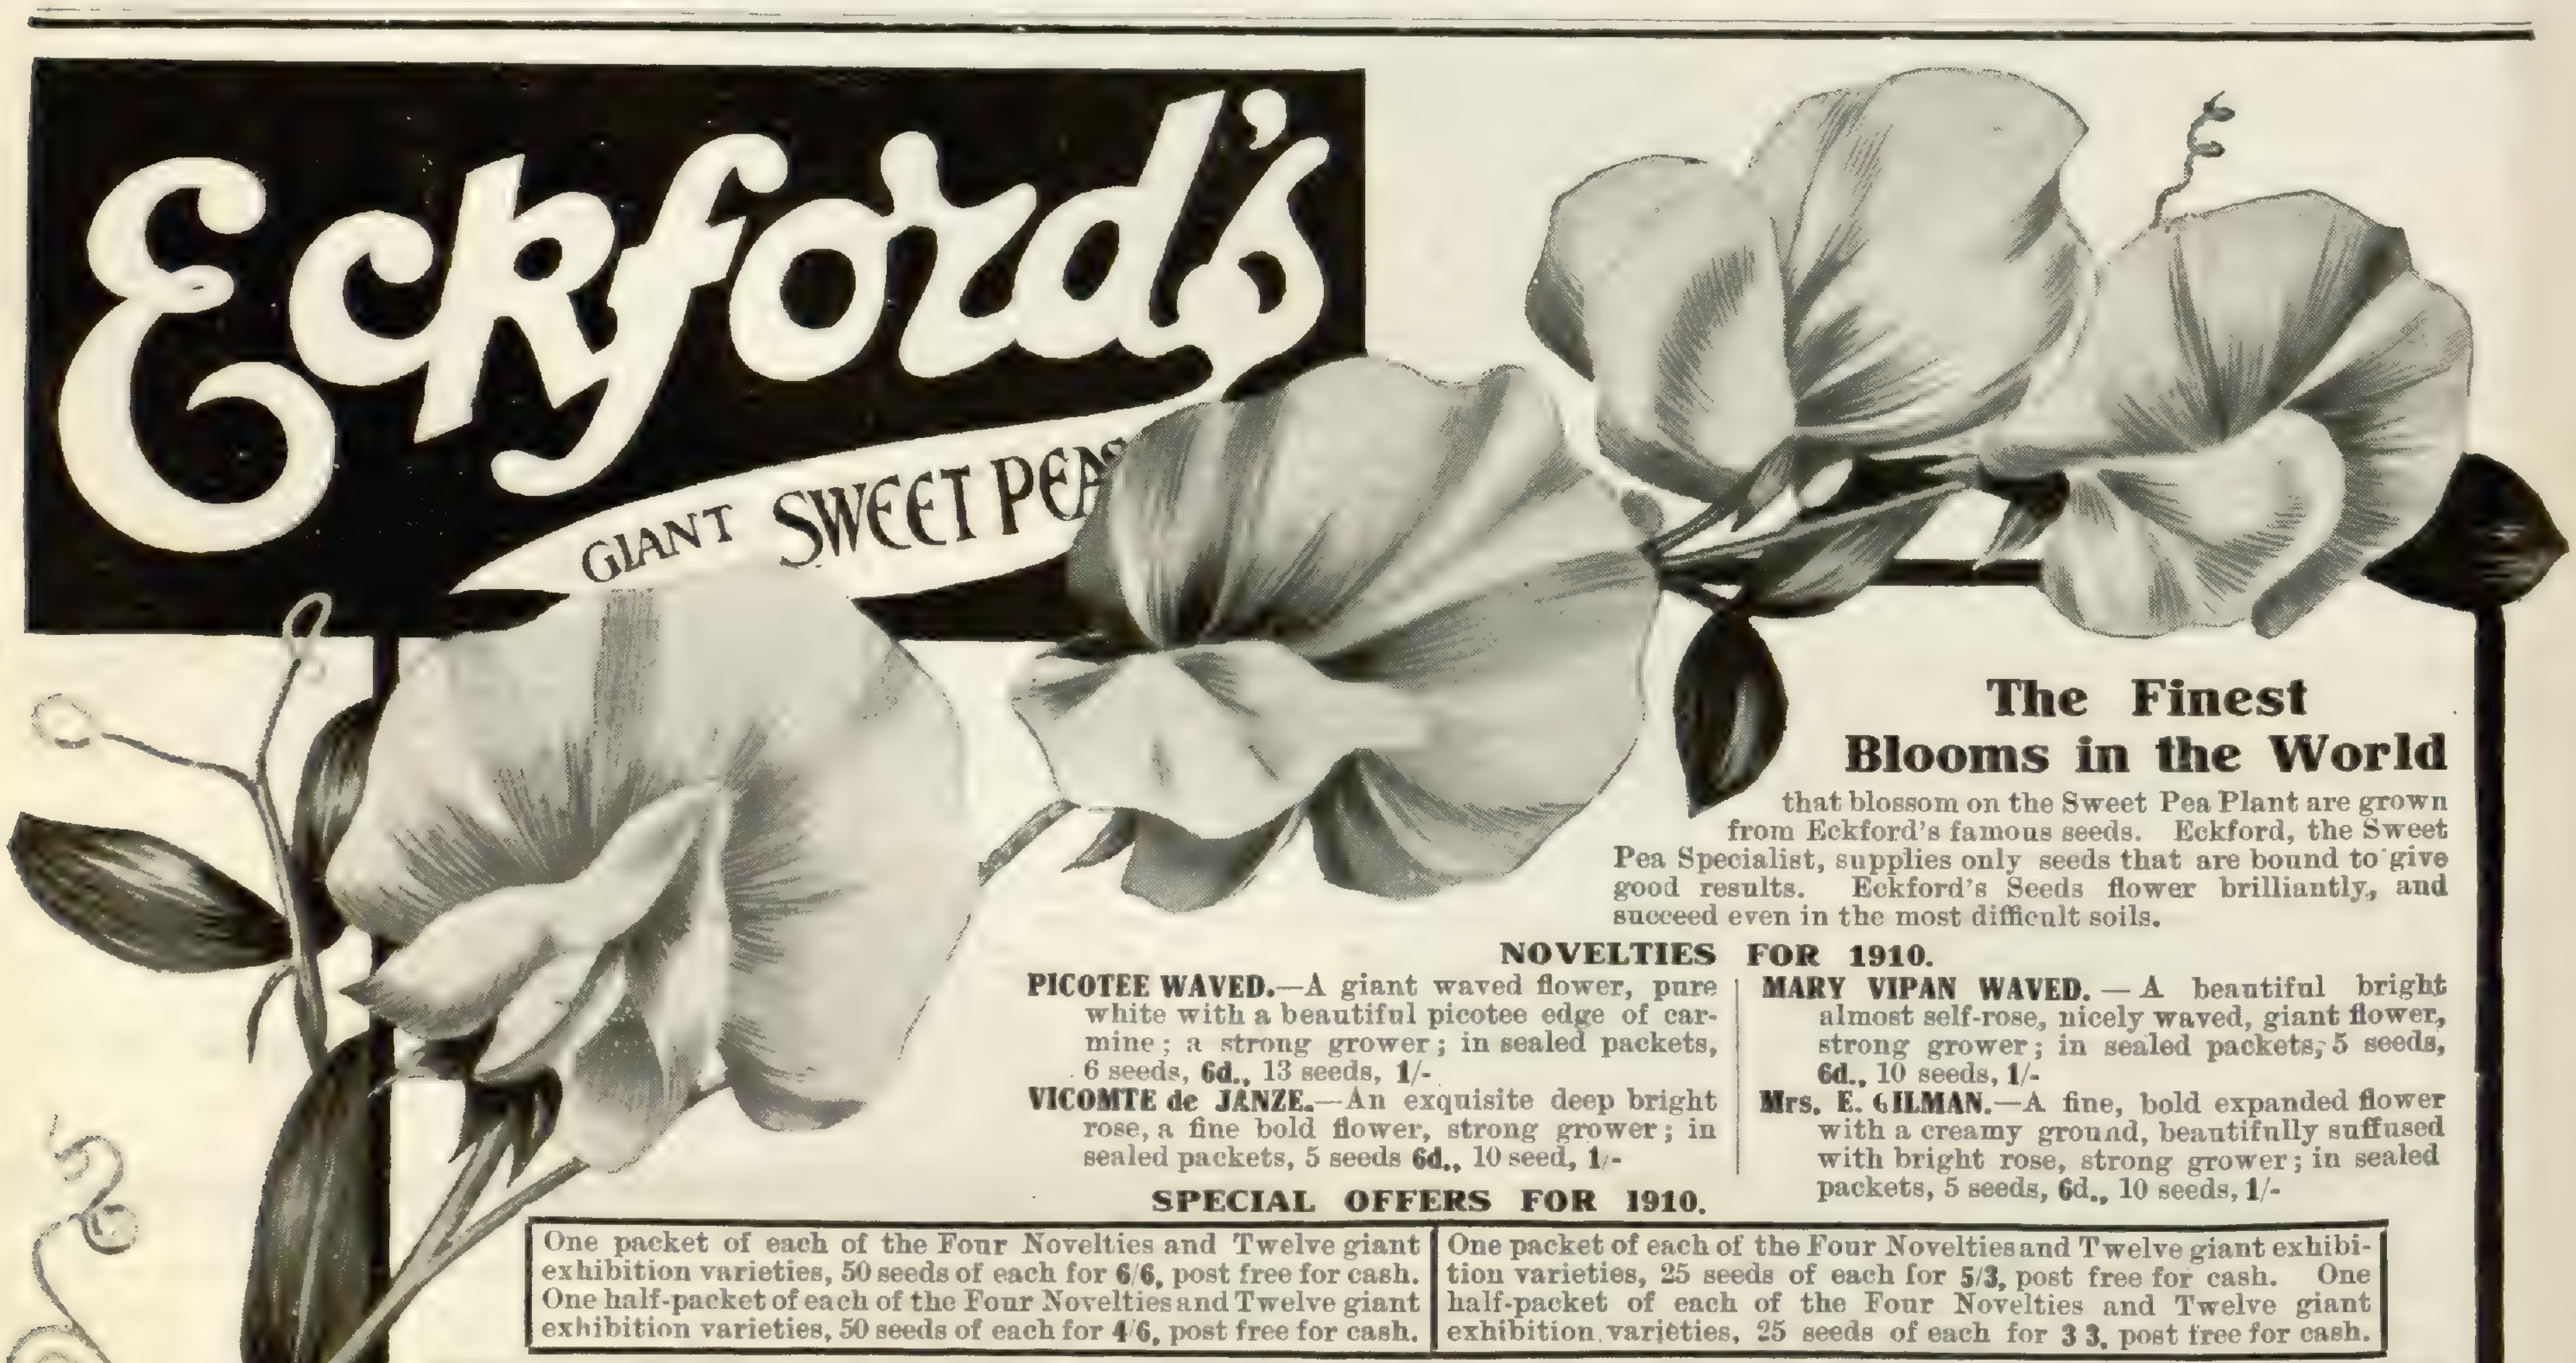
ZIZANIA AQUATICA.

The Canadian Rice plant (Zizania aquatica) is an excellent subject for planting in water, and therefore a suitable plant for the water garden. It grows from 4ft. to 6ft. in height, and soon forms a good clump. The growth is of light and elegant appearance, while the long narrow leaves recurve in a graceful manner. The attractiveness of the plant is further increased by the tall spikes which have branching heads. The seeds are like an elongated oat; the flower heads are straw-coloured, with rosy-brown scales which fall off as the flowers open. The plants seed freely, and, if required, the seeds should be watched, and gathered as they ripen, as waterfowl are very fond of them, and seeds which drop into the water are generally eaten if waterfowl are near.

So far the plants have proved hardy, and seeds sown in pans of water germinate freely. When germination has taken place, the young plants should be transferred to other pans of water, in which a layer of soil has been placed to form a rooting medium and enable the young plants to be more easily moved to their permanent stations in the water.

To display itself to advantage the plant requires considerable space. Some seeds should be sown annually, and, if sown early in the year, good plants will be produced in one season.

T. H. Slade.



The Finest Blooms in the World

that blossom on the Sweet Pea Plant are grown from Eckford's famous seeds. Eckford, the Sweet Pea Specialist, supplies only seeds that are bound to give good results. Eckford's Seeds flower brilliantly, and succeed even in the most difficult soils.

REGISTERED TRADE MARK.
THE FOUR OAKS.

When ordering your seeds, don't forget the "Four Oaks" Specialities.

SUPPORT BRITISH INDUSTRY.

All Gardeners are now discarding the old-fashioned foreign-made Knapsacks and buying THE LATEST AND BEST IN SPRAYING MACHINES.

The "FOUR OAKS" KNAPSACK SPRAYERS.

(Protected by Royal Letters Patent.)

Weight, 14 lbs.
Capacity, about 3½ gallons.

Acknowledged by all who have seen same to be **THE SIMPLEST and yet the BEST KNAPSACK SPRAYER ever produced.**

A CHILD CAN WORK IT.

THE ONLY MACHINE WITH FORCE BEHIND THE SPRAY.

This one point alone places the "FOUR OAKS" KNAPSACK right in front of all other Knapsack Machines, yet this is only one improvement out of many.

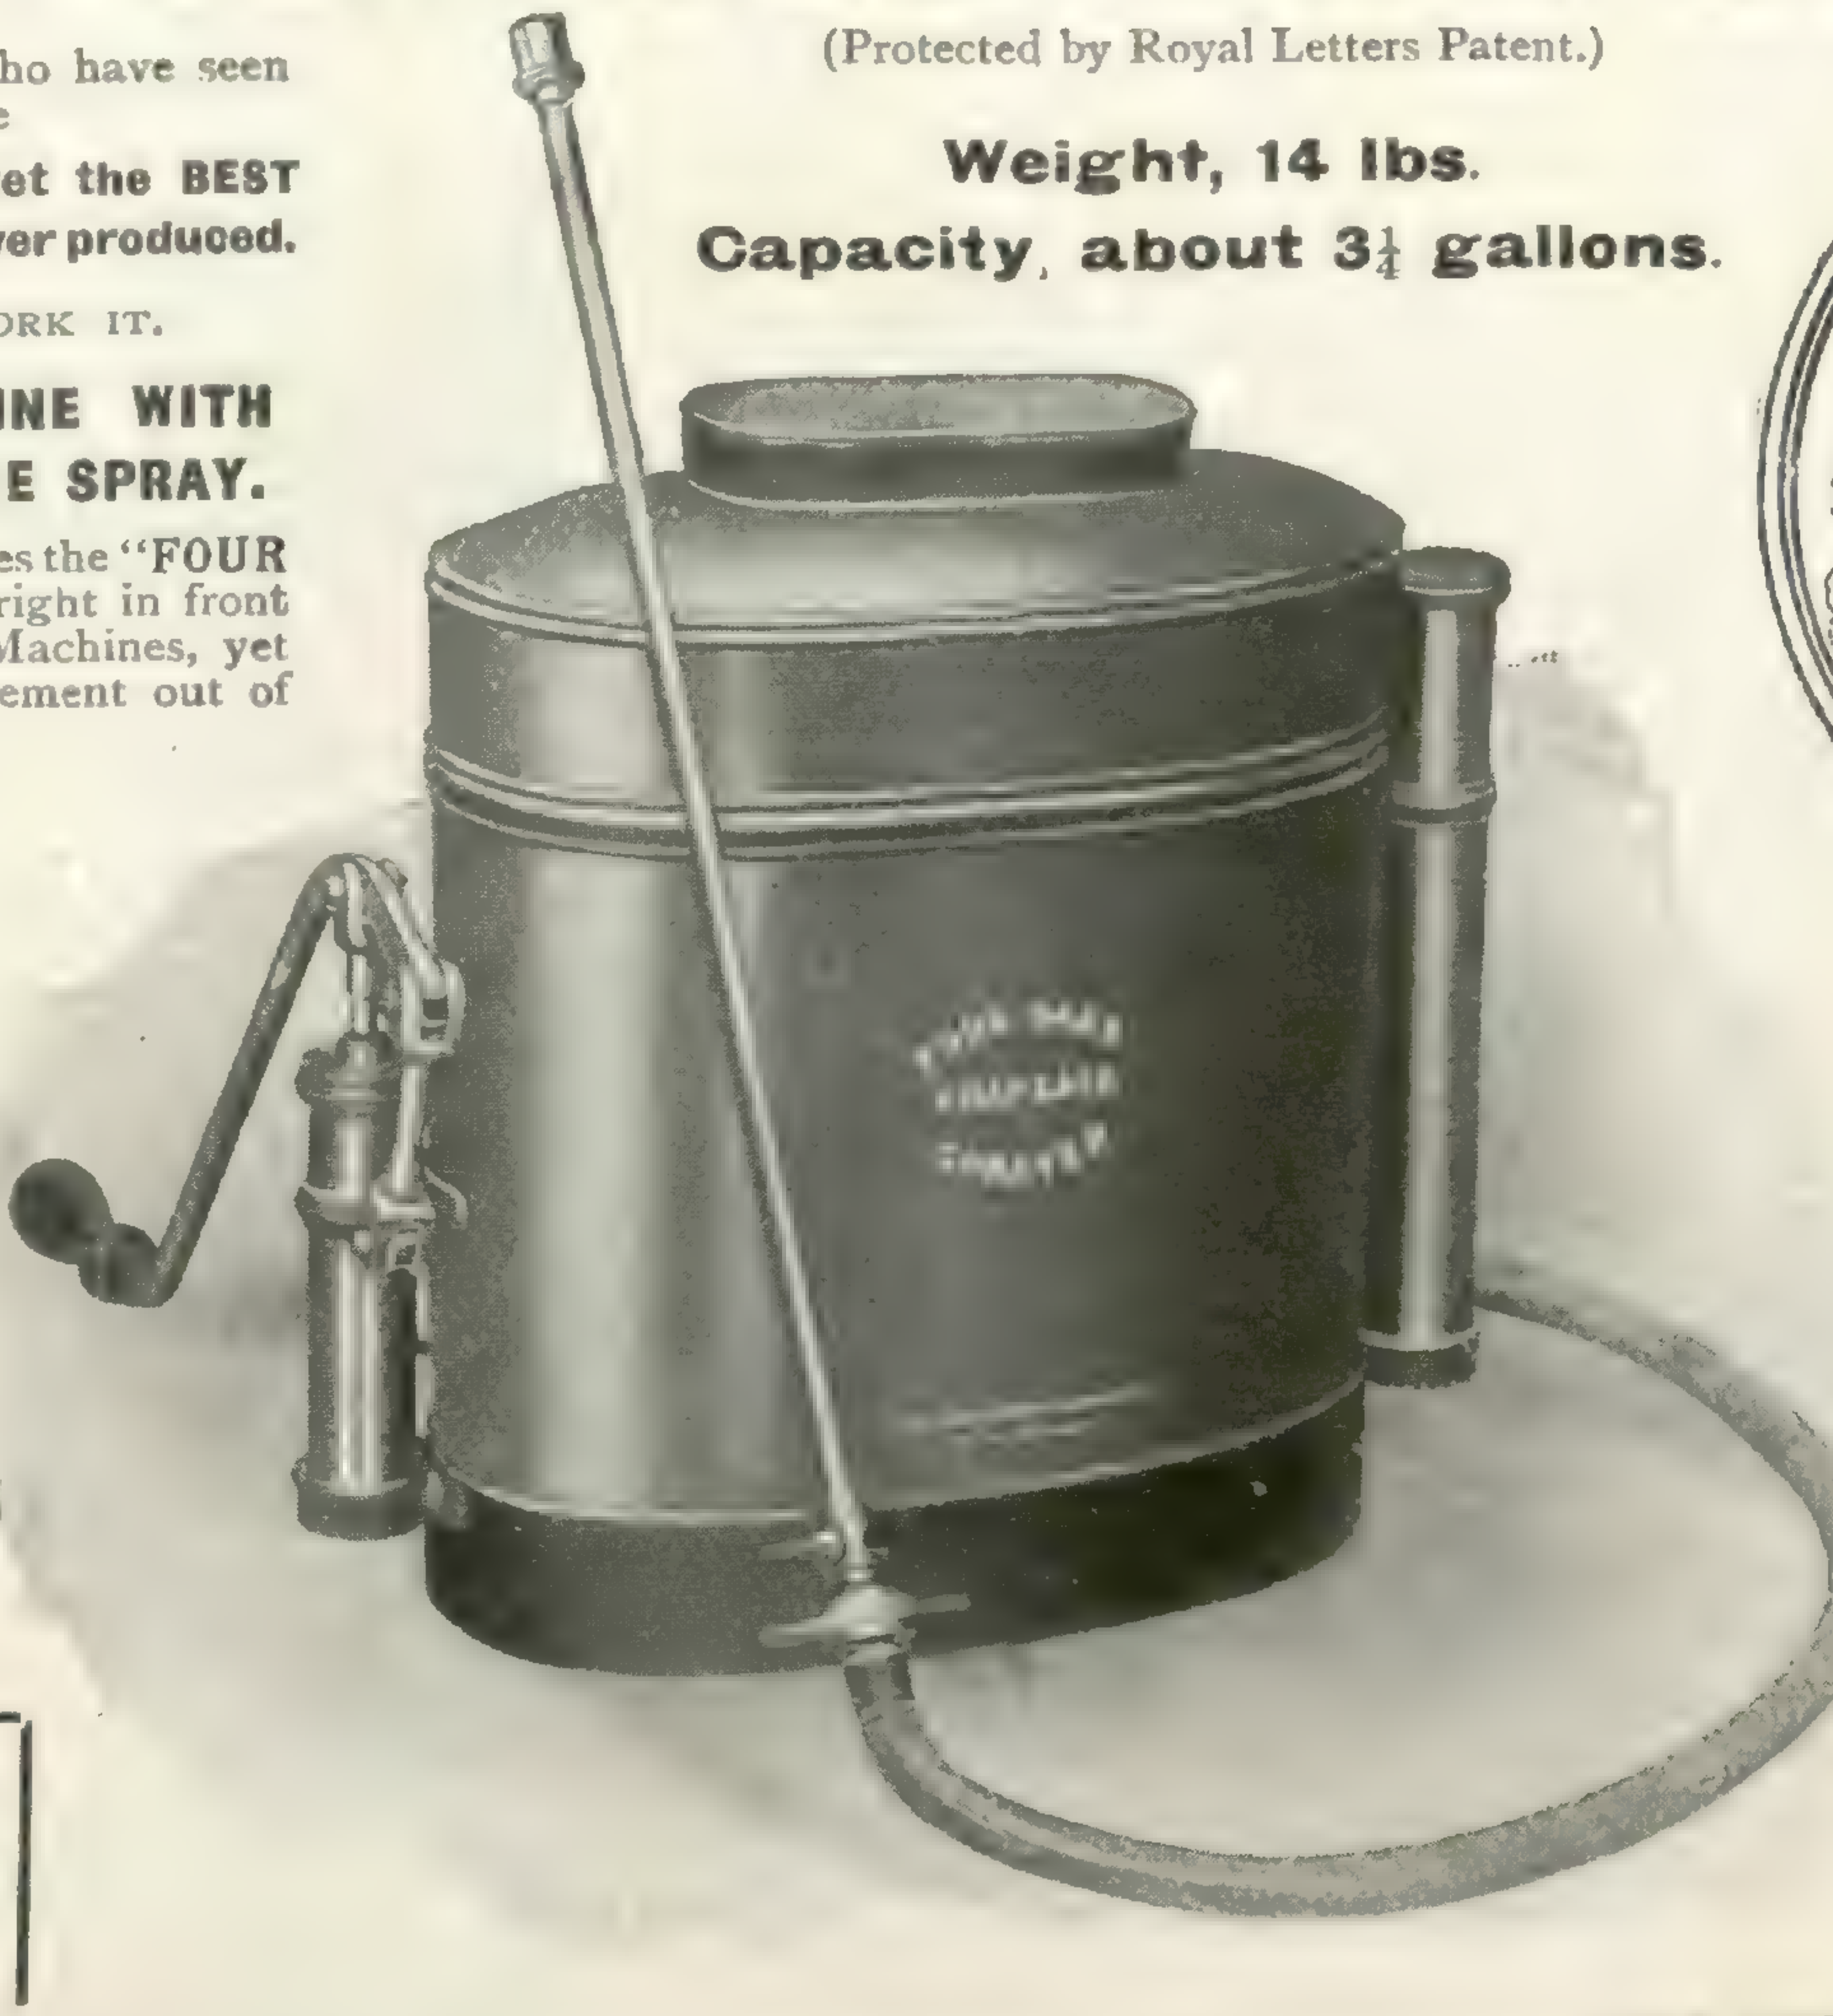
DURABILITY & SIMPLICITY THE GREAT FEATURE.

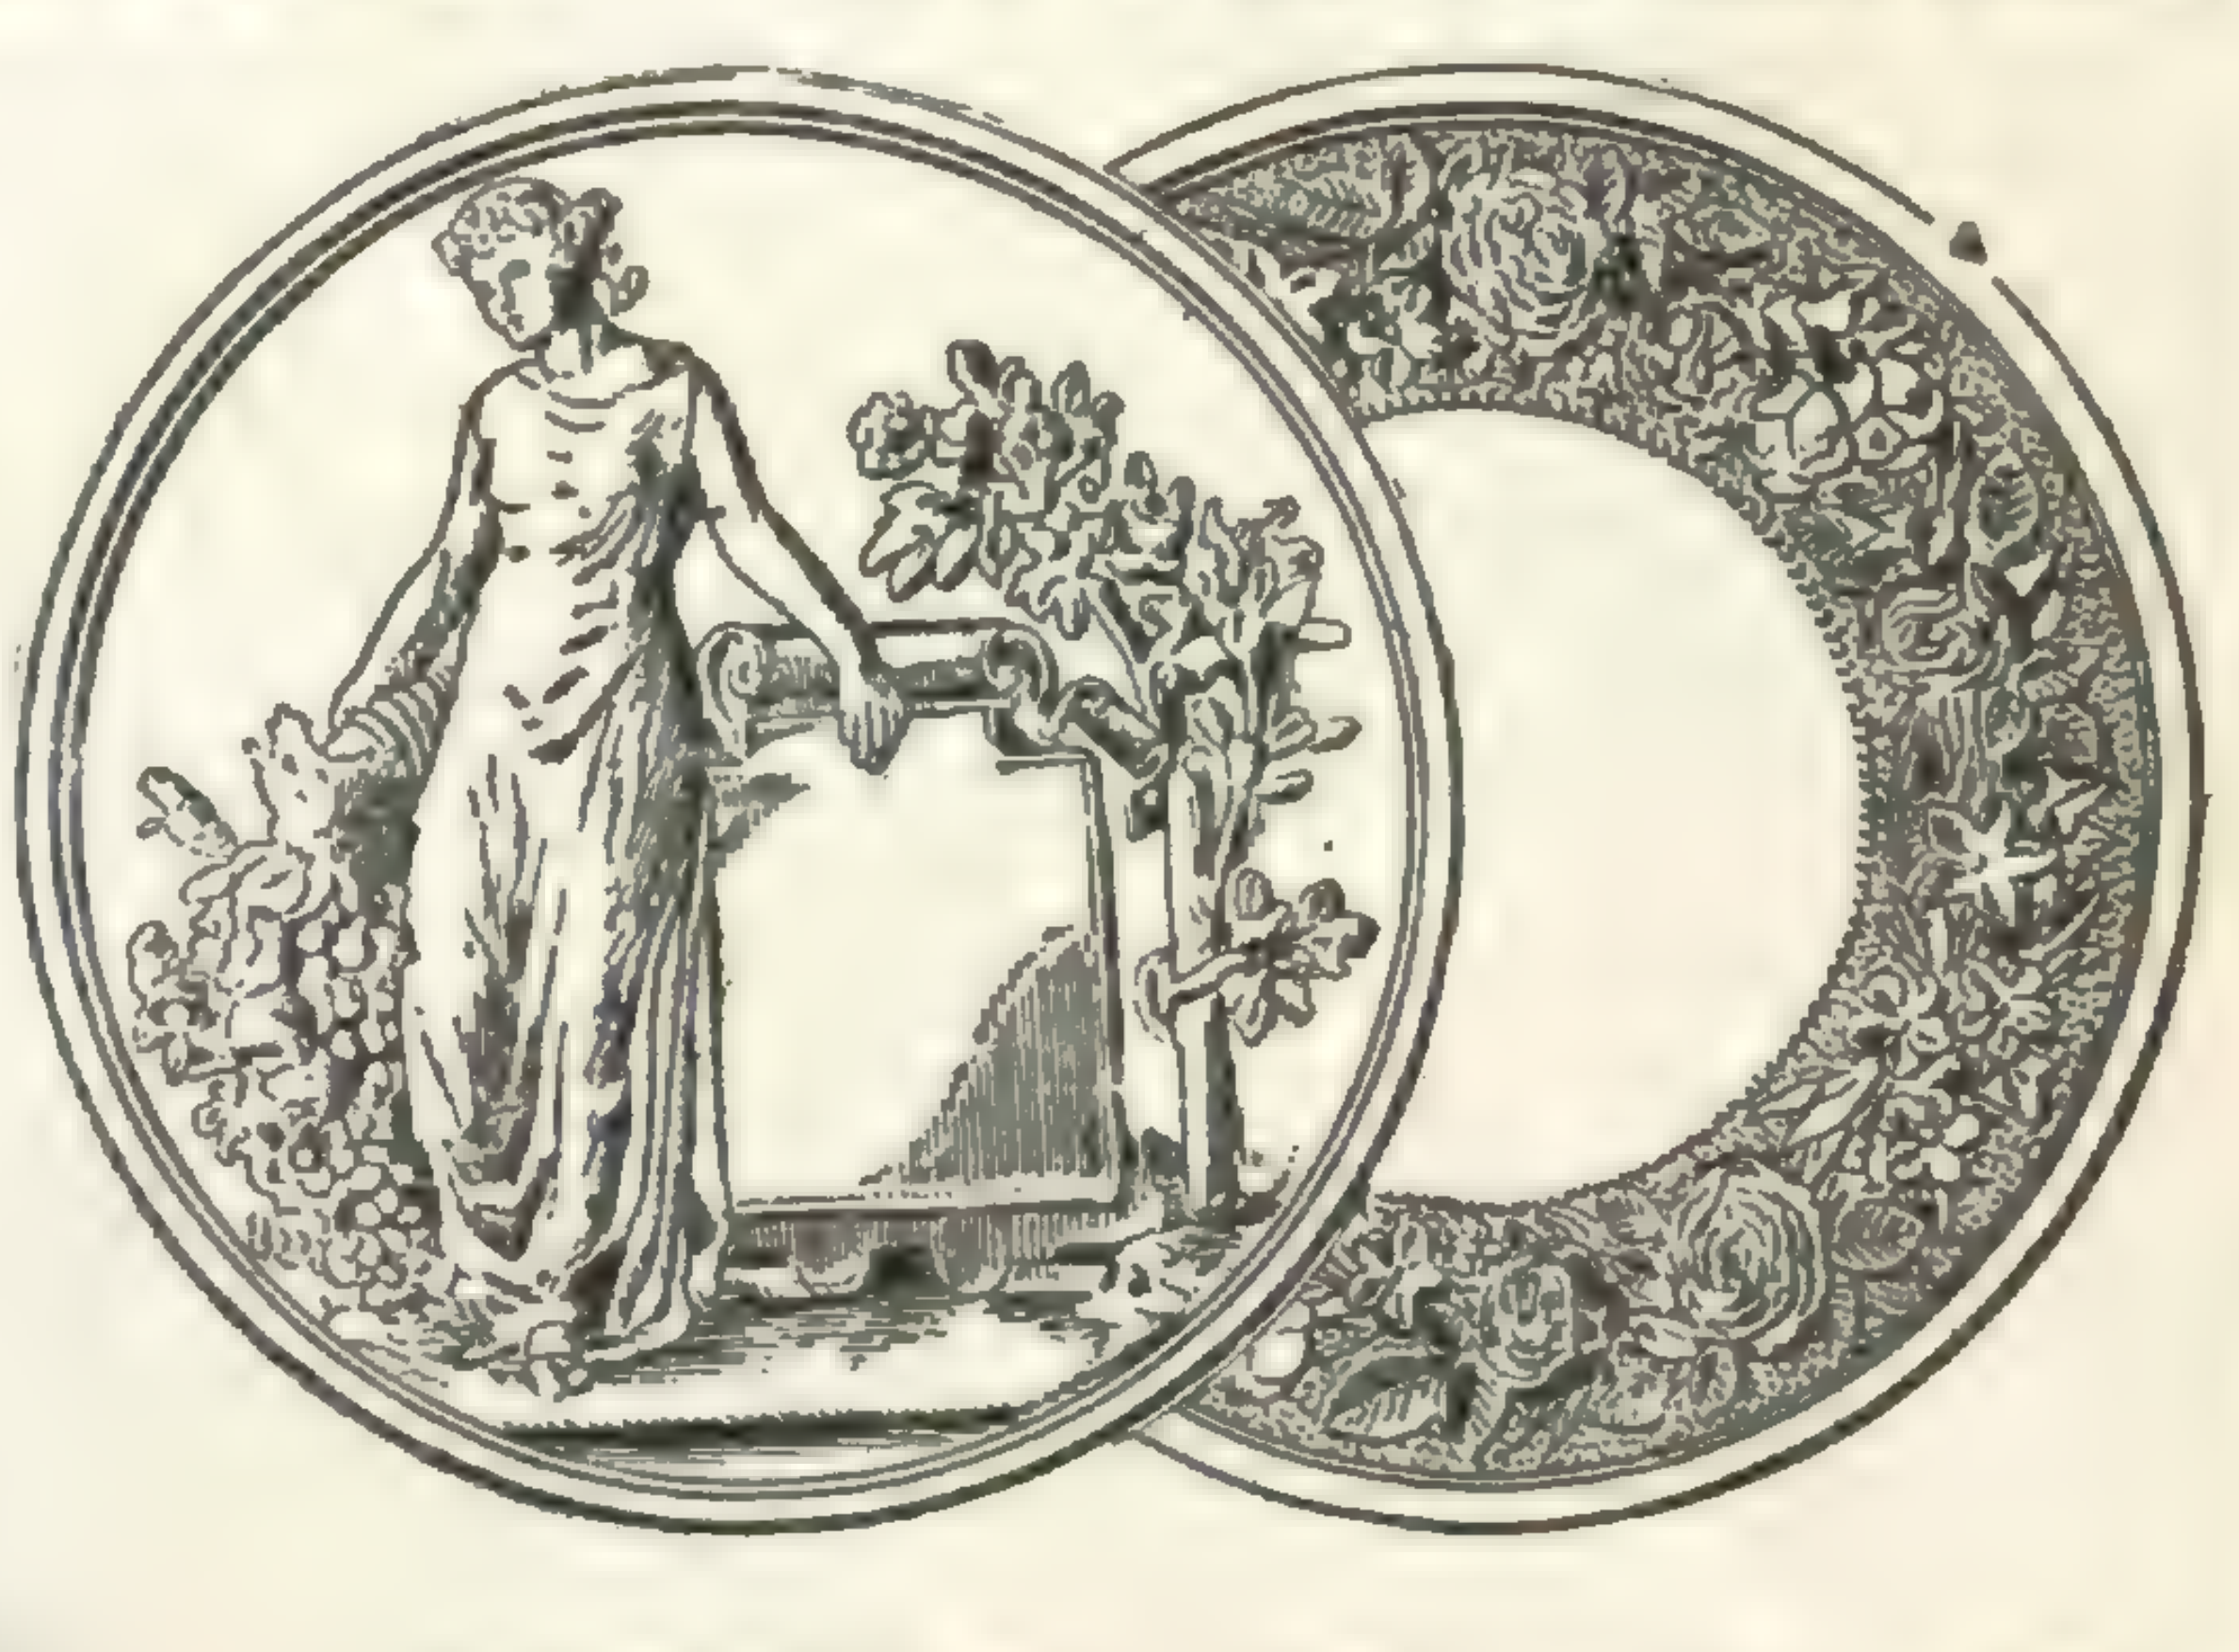
No Rubber Valves.

All Working Parts Outside.

Powerful Brass Pump giving great force behind Spray.

☞ **A Machine willingly sent on approval to any head Gardener.**





The "Four Oaks" **Knapsack** won **First Prize** (Silver Gilt Medal) at Wisbech Spraying Demonstration **AFTER EXHAUSTIVE TESTS** in competition with the world.

Also awarded **First Prize**, Silver Medal, by the Welsh National Agricultural Society, at Aberystwyth, 1909, for being Best New Implement in Show; **Silver Banksian Medal**, Royal Horticultural Society, Holland Park Show, 1909; **Diploma** at Hayes Spraying Demonstration; **Certificate of Merit**, Altrincham, etc.

"THE KING OF KNAPSACKS."

PRICE, complete with Single "Four Oaks" Patent Spraying Nozzle, also Single Swivel Spraying Nozzle and Short Brass Tube, with Stopcock, together with 3 feet length of India-rubber Tube, as illustrated above ... ... **45/-** Net Cash. Carriage Forw.r l.

Double Swivel Nozzle can be supplied in lieu of Single Swivel at **2/-** extra.

The Swivel Nozzles are for Spraying in any direction, either in front, or to the right hand or left hand, or up or down as desired by user, who can change direction instantaneously.

☞ **The "Four Oaks" Marvellous Nozzles give a finer Spray than any other ever made.** Price **3/6** extra.

Long Tubes for Spraying Tall Trees:

Patent "Four Oaks" Bamboo Lance, 10 ft. 6 in. long in one piece, with Interior Brass Tube, complete with Stopcock and all necessary Brass Fittings for spraying tall trees ... ... **17/6** extra.
6 ft. 6 in. ditto in 1 piece ... ... **12/6** ,,

The ordinary length of **India-Rubber Tubing**, as supplied with the machine, being too short for the management of the long lance by two men, ought to be replaced with an India-Rubber Tubing of 8 ft. in. length. Price, with union, **7/-** extra.

The "FOUR OAKS" Syringes ARE THE BEST THE WORLD HAS EVER SEEN.

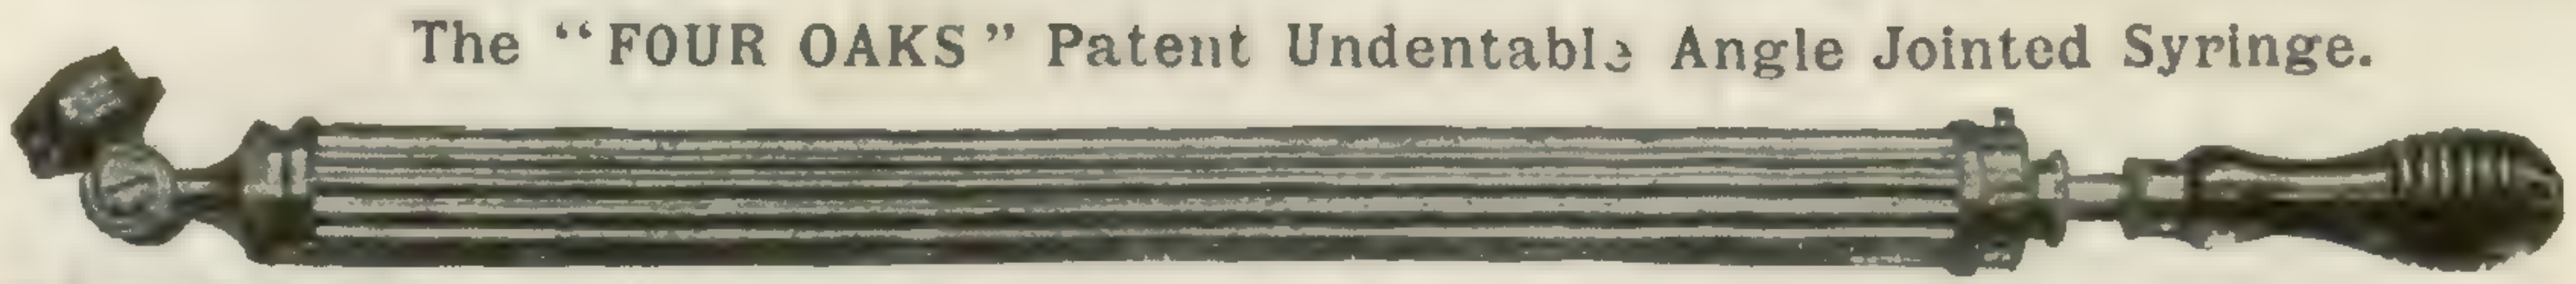
THE "FOUR OAKS" Patent Undentable Syringe.

"Four Oaks" Undentable Syringe, the Gardener's Ideal Syringe, complete with Jet as illustrated, also fine and coarse roses,

		Standard size.
No. 1.	Best quality, with teak handle Large size, 1¾ by 20 in., **25/-**	**1½ by 20 in., 21/.**
No. 2.	Good quality, rosewood handle Large size, 1¾ by 18 in., **21**/-	**1½ by 18 in., 17/6**

Standard sizes strongly recommended.

The "FOUR OAKS" Patent Undentable Angle Jointed Syringe.



"Four Oaks" Undentable Angle Jointed Syringe. Invaluable for syringing the undersides of leaves and branches which cannot be reached by the ordinary syringe. Is the Undentable Syringe illustrated above, with the addition of an Angle Joint.

		Standard size.	Large size.
No. 4.	Best quality, teak handle ...	**1¼ by 20 in., 27/-**	1¾ by 20 in., **32/-**
No. 5.	Good quality, rosewood handle...	**1½ by 18 in., 23/6**	1¾ by 18 in., **28/-**

Standard sizes strongly recommended,

The "FOUR OAKS" Patent Undentable Spraying Syringe.

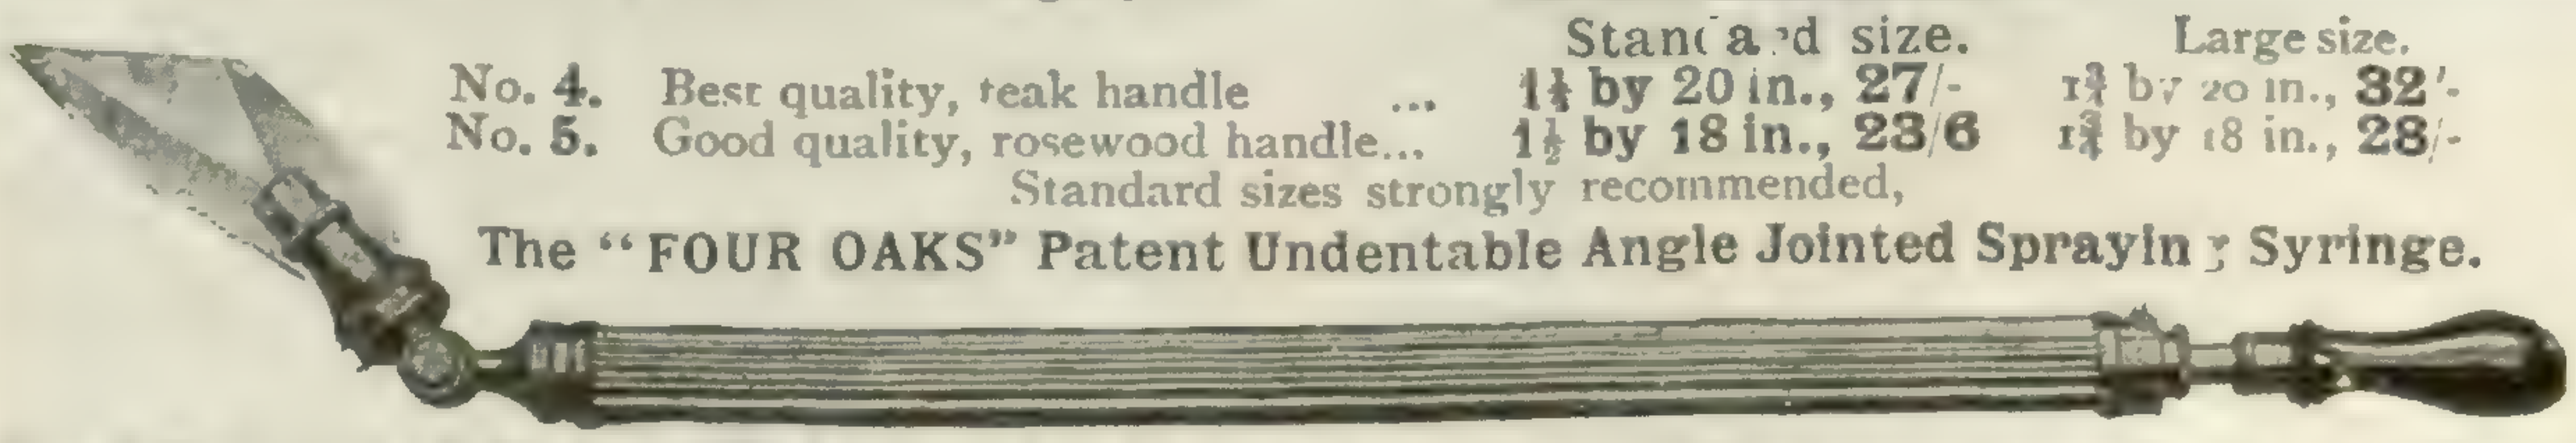
The "Four Oaks" Undentable Spraying Syringe. The most useful Syringe it is possible to have in a garden. Gives a fine vapour or mist like spray. Invaluable for ordinary spraying or for distributing Insecticides.

No. **9.** 1⅜ in. by 20 in., **12/6** 1½ in. by 20 in., **16/6**

Is fitted with quick filling ball valve.

The 1⅜ in. by 20 in. size strongly recommended.

The "FOUR OAKS" Patent Undentable Angle Jointed Spraying Syringe.



The "Four Oaks" Undentable Angle Jointed Spraying Syringe. This is the same Syringe as No. 9 illustrated above, but with the addition of an Angle Joint for spraying the undersides of leaves and branches. An invaluable syringe.

No. **9/AJ.** 1⅜ in. by 20 in., **18/-** 1½ in. by 20 in., **22/6** The 1⅜ in. by 20 in. size strongly recommended.

EXHIBITIONS AND MEETINGS.

◆

Croydon Gardeners' Association.

This society completed its second session for 1909-10 with a meeting of exceptional interest and usefulness. On this occasion there was a large attendance, and the members were entertained with a lecture and demonstration on floral decorations by Mr. R. H. Felton, of the firm of Messrs. Felton and Son, Court florists, Hanover Square, W. Mr. Felton's reputation as a floral artist is universal, and, with a keen sense of humour, throughout his lecture he kept his audience fully alive. His one great master which he copies in all designs is Nature, and his whole study is built up in this manner.

To illustrate the practical part of his work he exhibited a photograph of an overmantel decorated with the common dog-rose, and truly a beautiful picture it was, so that it exemplified clearly the artistic embellishment which can be acquired with flowers within reach of anyone. Other designs were shown where choicer flowers were used, but even in these the same talent was apparent, for the arrangements of the flowers were such that one concluded at once they were occupying the natural position as when growing. Stereotype design is unknown to him, and he strongly advised originality wherever possible. Present-day tastes accept anything original, and in this way the true artist's talent can be shown.

In his demonstration he made a bouquet of lilies of the valley, and before a very critical audience he fashioned it in a way which was very tasteful, and still could be carried without being a source of trouble to the carrier. His experience covers the whole range of floral decorations, illustrations of which he passed round to his audience, and they included receptions, dinner-table adornments, the Royal box at the Olympia, Court gatherings, and the floral emblems for those whose memory one cherishes when their labours are over, and they take their long rest.

Mr. Felton never tires in his work—at least, he appears not to do so—for, although in the midst of a busy decorative season, he was reluctant to bring his lecture to a close, and the chairman had to remind him of his late train to take him back to London. Tireless as he was, so were his audience, for they regretted exceedingly when he had to leave. It need hardly be said that the vote of thanks accorded Mr. Felton was of the heartiest.

TRADE NOTE.

The spraying of fruit trees during the winter months has now become such an essential part of the practice of experienced fruit growers that it is now being adopted by the general body of cultivators. For a considerable period one of the difficulties with which those growers had to contend who were desirous of adopting winter spraying as a part of their practice was obtaining spraying appliances adapted to their requirements. This difficulty no longer exists, for, owing to the efforts of the more enterprising of the manufacturers, cultivators can readily obtain machines that are exactly suited to their requirements. We have now before us the catalogue of the spraying machines manufactured by the Four Oaks Undentable Syringe and Spraying Machine Company, Sutton Coldfield, Birmingham, which is of much interest as showing how fully the needs of cultivators have, so far as spraying apparatus is concerned, been provided for. There are machines that are used as knapsacks, machines with oak and iron containers that run on wheels, machines with oak and iron containers that may be carried about by hand or in cart, a machine of oak that is carried about by two men by means of handles that have a resemblance to those of a hand-barrow. We advise those of our readers who are interested in spraying operations to obtain a copy of the catalogue. The machines are throughout remarkable for the excellence of materials and workmanship, and therefore the only point to be considered is their suitability for the purposes for which they may be required.

Sweet Peas.—Growers of sweet peas will welcome the third and revised edition of Mr. C. H. Curtis's popular work, "Sweet Peas and their Cultivation," just issued by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London. The book has been thoroughly brought up to date, so as to include all the new varieties introduced last year, and several new illustrations have been added. The price is 1s. net (by post 1s. 2d.), or bound in cloth 1s. 6d. (by post 1s. 8d.).

ANSWERS TO CORRESPONDENTS.

RED SPIDER ON VIOLETS.—H. S., Chelsfield: Red spider on the undersides of violet leaves is usually a sign of drought. In other words, red spider is encouraged by keeping both the roots of the plants and the atmosphere of the frame very dry. At this season of the year the difficulty most experienced is that of keeping up a circulation of air sufficient to prevent damping of leaves and flower buds; you do not tell us whether the frames are heated, and if so, by what means? Remove all decaying leaves and flowers, see that the soil is thoroughly moistened, and early on a bright mild day spray the plants with a warm solution of soft soap, using sufficient soap to make the water soft and slightly adhesive. Some flowers of sulphur may be added, or may be dusted on to the leaves while they are still moist.

CYCLAMEN FLOWERS DAMPING. — H. S., Chelsfield: Probably the greenhouse is too cold, and this, coupled with a moist, heavy atmosphere induced by lack of heat, sunshine, and ventilation, will soon cause flowers to damp off. In dull, mild weather artificial heat may not be greatly needed to maintain the temperature of a greenhouse, but it is very desirable that the pipes be kept comfortably warm and ventilation given so that the atmosphere of the house circulates freely and is kept at about 55 degrees. Water the plants carefully, and take advantage of bright mornings to water all that need it, so that surplus water is drained away or evaporated before evening.

WISLEY GARDENS.—S. L. H., Northampton: We have described and illustrated various features of the Royal Horticultural Society's gardens at Wisley on several occasions, and the work done at those gardens has been again and again referred to in our columns. It is quite impossible to describe the gardens in a brief reply; you should visit them. The gardens consist of about 60 acres of land presented to the society by the late Sir Thomas Hanbury, K.C.V.O., and includes the celebrated wild garden of the late Mr. G. F. Wilson, V.M.H. Several acres of fruit trees have since been planted, and an outdoor vineyard has been started as an experiment; fine collections of flowering shrubs and of roses have been presented; trials of vegetables and of hardy flowers and plants are continually in progress; and an extensive range of glass houses, including orchard house, vinery, stove, propagating pits, etc., has been erected, so that all departments of horticulture are represented. Each student also has a small plot allotted to him; and a botanical garden, in which plants are systematically arranged according to a natural system of classification, is in course of formation. A well equipped meteorological station is situated in the garden. Weybridge is the nearest railway station.

STANDS FOR CACTUS DAHLIA BLOOMS.—R. C., Sheffield: The regulations of the National Dahlia Society govern these matters. All boards must be three inches high in front and nine inches high at the back. For twelve blooms the board measurements are, 26in. long by 19½in. wide; for twenty-four blooms, 52in. long by 19½in. wide; and for forty-eight blooms, 104in. long by 19½ in. wide.

HERBACEOUS PLANTS AMONG RHODODENDRONS.—Cork, Ireland: In the absence of manure for regular top-dressings it will be a great mistake to plant herbaceous phloxes, helianthuses, chrysanthemums, and other strong growing subjects between the newly planted rhododendrons. The herbaceous plants would not be a success after the first year unless amply fed, while their strong roots and great need of food and moisture would make them the worst of neighbours for the rhododendrons, consequently both would suffer. Almost all the hardy lilies would do well in the peaty loam, among the rhododendrons, and would not in any way harm the latter. If you do not plant lilies or wish to spread the expense of so doing over a couple or three years, the vacant spaces may be devoted to thinly planted annual flowers.

HEERIA ROSEA.—B. J., Ireland: Heeria rosea is a somewhat rare stove plant, and one that is very useful for winter-flowering when well managed. It thrives best in equal parts of sandy peat and loam. Propagation is by means of cuttings taken in February or March, and inserted in sandy soil in a close propagating frame. Young stock should be grown freely in a warm house until the summer, when a frame or pit will suit them, and towards the end of the summer the lights of the frames may be entirely removed for a few weeks. Older-established plants need similar treatment, but they should be gradually hardened after new growth is made, and be put out of doors in a sunny position during the summer. Heeria rosea should be brought indoors early in the autumn, and, as the weather grows colder the plants should be transferred to a warm intermediate house, or stove. So far as we can gather from your letter, the failure to flower Heeria rosea is due to late housing, and, probably, to excess of heat when the plants are first brought in from out of doors. As the plants are gradually inured to outdoor conditions in the summer, so they should be gradually returned to the warm conditions of a stove or intermediate house. Heeria rosea is a sub-shrubby evergreen plant, from Mexico. It belongs to the order Melastomaceæ; Heterocentrum mexicanum is a name under which it was once known. The moist atmosphere of the South of Ireland is probably not the most suitable for flower-production in the case of a plant from a comparatively dry country, consequently shelter from heavy rains during the time Heeria rosea is out of doors suggests itself as a necessary point to be observed in its cultivation.

NAMES OF PLANTS.

L. B., Leamington.—1, Chorizema Lowi; 2, Plumbago rosea; 3, Dracæna terminalis.

R. G. J., Watford.—1, Cypripedium Leeanum, a very good variety; 2, Primula verticillata.

T. W. O., Peel.—1, Fuchsia triphylla; 2, Begonia manicata; 3, Acacia dealbata; 4, Jasminum nudicaule; 5, Solanum jasminoides.

NEW BOOKS.

GARDENING YEAR BOOK FOR 1910.

By George Gordon, V.M.H.. (The "Gardeners' Magazine" Office, 148 and 149, Aldersgate Street, E.C.) Price 1s. net; 1s. 3d., post free.

In referring to the issue of the "Gardening Year Book" for the current year, it is a matter of some interest to call to mind the fact that it is the only annual of its kind that has been the guide of amateur and practical horticulturists for upwards of half a century. It is certainly a matter of satisfaction that, high as its popularity has been throughout the past fifty odd years, it has not been regarded with so much favour by those interested in gardening as at the present time, as shown by the largely-increased demands that are now being made upon the publishers.

The remarkable success of the book is unquestionably due to the adoption of a plan which a wide experience in horticultural matters had shown to be the most likely to prove useful to the general body of its readers, and then endeavouring year by year to perfect it in its various details. Equal attention has been paid to the necessity for making such changes from time to time as would keep the contents fully abreast of the times, and thus fully meet the requirements of readers who give immediate attention to new methods of procedure, and to the various classes of plants that at frequent intervals come into special prominence.

As in previous issues, the "Year's Work in the Garden" forms a feature of much importance, for therein the reader is provided with a complete guide to the work that has to be done month by month throughout the year, and also to the manner in which the various details should be carried out. The section devoted to "Hardy Flowers for Beds and Borders" places the reader in possession of all the information he could desire on

READ THIS BOOK NOW!

READ this work now, for in the winter months you have most time for indoor study. The result will be that next year your knowledge will be greater than it ever was before, because you will gain the advice of 27 of the first horticultural experts of the day.

THOMPSON'S GARDENER'S ASSISTANT,

Edited by **W. WATSON, F.R.H.S.**, Curator of Kew Gardens.

To explain adequately what so large a work contains would require pages of THE GARDENERS' MAGAZINE. The following much abridged List will, however, give some small idea of the contents of the six large volumes: Meteorology—Plant Structure—Nutrition—Growth and Branching—Reproduction—Hybridisation—Classification—Insect and Other Plant Enemies—Plant Diseases—Soils—Manures—Tools and Instruments—Garden Structures—Heating—Propagation—Transplanting—Pruning—Flower Gardens—Ornamental Trees and Shrubs—Herbaceous Perennials—Aquatic and Bog Plants—Hardy and Half Hardy Annuals—Greenhouse and Conservatory—Stove and Tropical House—Orchids—Ferns—Palms and Cycads—Shrubs, Plants and Bulbs for Forcing—Retarding Plants—Spring, Summer, and Carpet Bedding—The Sub-tropical Garden—Orchards—Spraying Fruit Trees—Orchard Houses—Preserving, Packing, and Storing Fruits—Vegetables—Index (giving common and classic names). Thompson's Gardener's Assistant is the **cheapest** and most authoritative book dealing with **all** gardening.

THOMPSON'S GARDENER'S ASSISTANT

A COMPLETE GARDENING EDUCATION.

Hundreds of Illustrations in colour and black and white aid in explaining the text. Bound in two styles, cloth and half leather. The cloth edition costs 48s., the half leather (2 vols., Roxburgh library style), 50s. Low as the price undoubtedly is, it is not necessary to pay down the whole sum at once.

4/-

Send 4s. with your order, and we will send the work, bound in the style you prefer, carriage paid (post extra abroad), the balance of net price to be remitted by monthly sums of 4s.

BARR and SONS,
11, 12, and 13, KING STREET, COVENT GARDEN, LONDON.

the selection, propagation, and cultivation of all the finest of the hardy flowers. Not less useful is the section devoted to "Conservatory and Greenhouse Plants," all the most useful subjects having separate paragraphs wherein the best kinds to grow are enumerated, and concise directions given for their cultivation. "Bulbous and Tuberous-rooted Plants" are dealt with in precisely the same manner, and the reader is thus provided with a complete code for the selection and cultivation of the most useful genera. Ample information is given on the planting and management of hardy fruits, and on the cropping and cultivation of the kitchen garden, and with reference to these important developments it may be said that the reader who closely follows the advice given will have none but the best varieties, and these will be grown to the highest degree of perfection. As further aids to cultivators, there are chapters on fungoid diseases, insect pests, and garden recipes. There are also numerous special articles, such, for instance, as "Croquet Lawns," "Pillars of Roses," and "Simple Rock Gardens."

Invaluable as records of the work that is being done in the improvement of ornamental plants, fruits, and vegetables are the descriptive lists of the new plants, flowers, fruits, and vegetables that received distinction during 1909. Of a high degree of utility also are the directories of public parks and gardens, and of horticultural societies in the United Kingdom, for they are comprehensive, and as accurate as it is possible to make them. We would add that the book contains several coloured plates and a large number of illustrations in black and white.

THE CITY DIARY FOR 1910.

(W. H. and L. Collingridge, CITY PRESS, 148 and 149, Aldersgate Street, E.C. Price 1s.)

Those who are in no way interested in the affairs of the City of London will appreciate this diary for its handy size, strong binding, and the high quality of the paper and excellent ruling; and be not slow to recognise the fact that they have full value for their money. The City man will not be less appreciative of the merits of the diary as a medium for entering engagements and other memoranda that properly belong to the pages of a diary. He will also attach much value to the large amount of information it contains relating to persons and institutions specially associated with the City. It contains, for example, the names and addresses of the members and officers of the Corporation, the City clergy, ward clerks, vestry clerks, etc.; particulars of the livery companies, City officials, schools, hospitals, etc. We have used the "City Diary" for over a quarter of a century, and it so fully answers our requirements, which are rather exacting, that we have no desire for anything better.

FORTHCOMING ENGAGEMENTS.

MONDAY, January 10.—Royal Horticultural Society's Public Parks Examination, at Royal Horticultural Hall, at 10 a.m.

United Horticultural Benefit and Provident Society; Committee Meeting.

TUESDAY, January 11.—Royal Horticultural Society; Committees meet at 12 o'clock; Scientific Committee at 4 o'clock.

Horticultural Club: House Dinner at 6 p.m., to be followed by a lecture on Ceylon, by Mr. Alexander.

WEDNESDAY, January 12.—East Anglian Horticultural Society.

THURSDAY, January 20.—Gardeners' Royal Benevolent Institution; Annual Meeting, Election, and Supper; Simpson's, Strand.

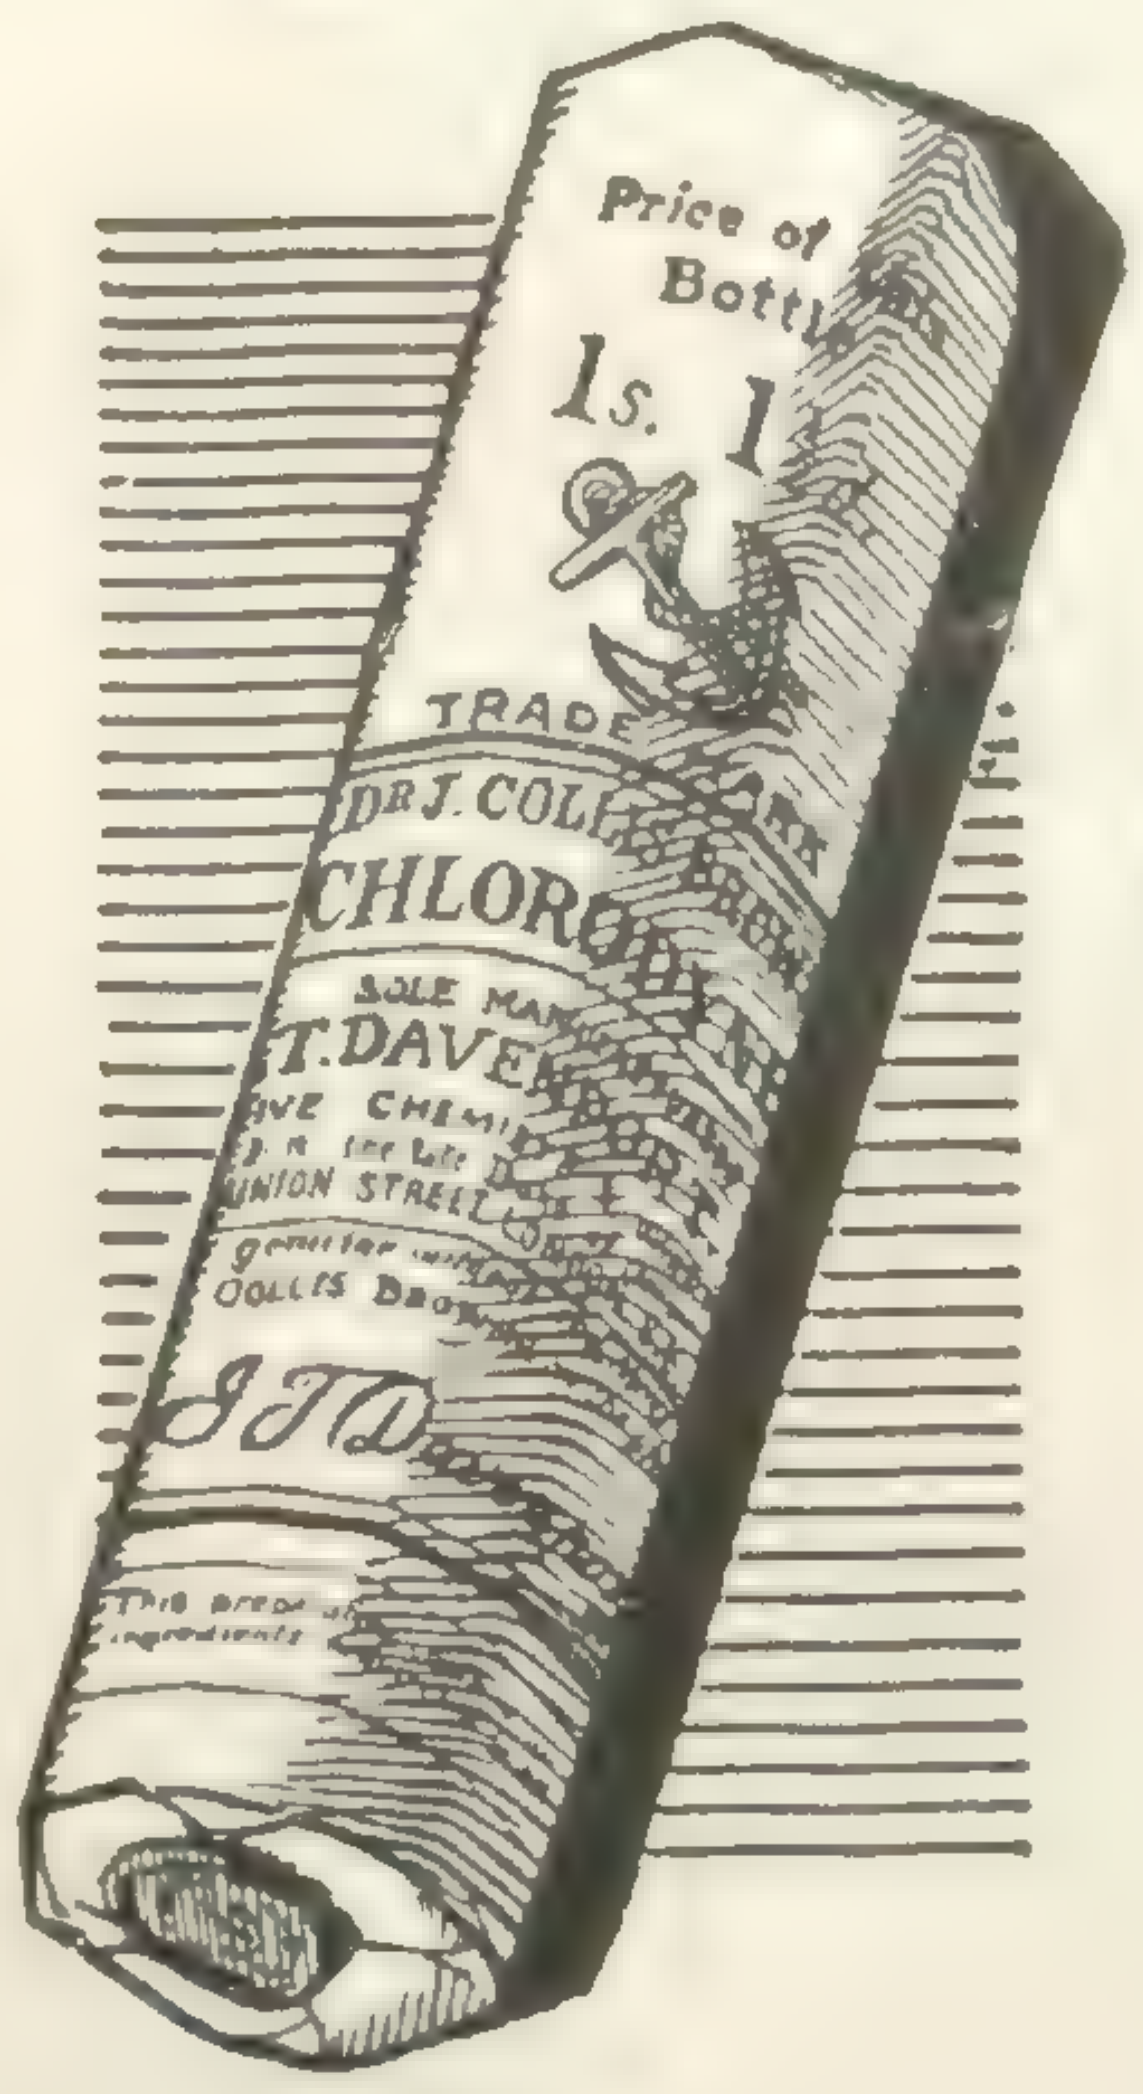
Dr. J. Collis Browne's
Chlorodyne



The Original and Only Genuine.

Acts like a charm in
DIARRHŒA, DYSENTERY and CHOLERA.

Effectually cuts short all attacks of
SPASMS, HYSTERIA and PALPITATION.

The only Palliative in
NEURALGIA, TOOTHACHE, GOUT, RHEUMATISM.

The BEST REMEDY KNOWN for

COUGHS, COLDS
ASTHMA, BRONCHITIS.

This wonderful medicine was discovered by **Dr. J. Collis Browne** (late Army Medical Staff) and the word

Chlorodyne

coined by him expressly to designate it. There has never been a remedy so vastly beneficial to suffering humanity, and it is a subject of deep concern to the public that they should not be imposed upon by having imitations pressed upon them on account of cheapness. **Dr. J. Collis Browne's Chlorodyne** is a totally distinct thing from the spurious compounds called Chlorodyne, the use of which only ends in disappointment and failure.

When you ask for CHLORODYNE see that you get

Dr. J. Collis Browne's.

The name is on the stamp of every bottle of genuine Chlorodyne.

Convincing Medical Testimony with each bottle.

Of all Chemists, **1/1½, 2/9, 4/6.**

Send for Illustrated Catalogue, free. BOULTON and PAUL, Ltd., Manufacturers, Norwich.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer. 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Insect Foes and Friends.

With plants under cultivation, it is always one of the main tasks of the grower to keep at bay, as far as possible, the insect foes which are always invading his preserves, and attacking in overt and covert ways his most precious possessions. The very fact that many of these plants are of exotic origin, and, therefore, necessarily grown under artificial conditions, which render them extra toothsome morsels for the depredators, in many instances increases the difficulty. Few plant lovers, too, know anything of entomology; to most of them, all insects are foes, save, perhaps, the bee, whose services as fertilising agents are generally recognised. Hence the knowledge that probably every foe has its own individual insect antagonist, which, if encouraged instead of being destroyed, would help him greatly in the struggle, could scarcely be too widely inculcated. Thus, for instance, the ladybird, in both its larval and perfect form, is a voracious devourer of aphis, so that a few of them will speedily clear an infested plant. The lacewing fly, whose long-stalked eggs are often seen and wondered at, is equally an aphis destroyer. Then we have a large number of slender-bodied ichneumon flies, all destroyers of other insects, most, if not all of which are foes. The spider, as a purely carnivorous insect, must be reckoned among the friends, but it is a very remarkable fact that no species of spider has been apparently evolved to deal with such easy and succulent prey as the aphis. Every gardener occasionally finds spiders at home in straggling webs in his pot plants, where there seems little or no likelihood of flies proper being entrapped, yet all the while, within a few inches of the presumably hungry insect, an ample meal of aphis is spread, which only needs a visit to fully satisfy his appetite. Even the lanky-legged sprawling harvest man, with which we are so familiar in the autumn, which spins no web, and is always stalking some invisible prey, is never seen contentedly appropriating a family of aphis, as one would desire, as a gardener, that he should do, and do thoroughly. The several varieties of thrips, including the white fly, seem similarly immune from spider attack, though obviously the easiest of prey, since, at any rate in their larval form, they are entirely sedentary. Even in slugland the gardener is apt to kill a friend instead of a foe, when he comes across specimens of the yellow haliotis, whose prey, despite its resemblance to an ordinary slug save its colour and rudimentary shell on its back, is slugs and worms, so that it should always be spared when identified. In short, so far as regards the internecine war which reigns in the insect world, as in all realms of natural history, the gardener has undoubtedly much to learn, and if the scientific entomologist could epitomise the cases where insects are particularly the gardener's friends, giving descriptions by which they could be recognised, good service would be done. In the broad sense, and apart from this internecine conflict, the insect friends in the plant world must certainly predominate over the foes. Many of the so-called foes, though playing a destructive part in one phase of their life history, make up for it by good service at another. Thus it is with the moths, butterflies, bees, and some beetles, which, in their perfect, or flying state, have done an infinity of work in plant evolution by instinctive selection of pollen from the brightest and most conspicuous blossoms, and its transference to similarly conditioned flowers elsewhere, at once strengthening the constitution by cross-fertilisation, and improving the type by the selection aforesaid. The caterpillars or grubs of all these either feed upon the foliage or on material collected from the flowers, and, in the former case, are regarded by the plant lover as terrible pests, since, unless their numbers be checked by birds or other means, the destruction they cause is apt far to counterbalance the good they do, in, so to speak, a future state. Left to herself, Nature keeps a fair balance, and it is only where man steps in, and by introducing artificial conditions, or transfers the insect, as with the codlin moth in the United States, to fresh woods and pastures new to it, and void of its natural checks, that calamity results.

MR. D. KIDD.

Mr. D. Kidd, who for many years past has had charge of the extensive and extremely beautiful gardens of Carberry Towers, the seat of Lord Elphinstone, has by reason of his administrative ability and cultural skill attained to a foremost position among the leading gardeners in the important district of which the City of Edinburgh is the centre. The gardens of Carberry Towers are not, perhaps, so frequently visited by horticulturists staying in the Scottish capital as some others, but this is owing to their not being so readily accessible as are some other of the leading establishments. That they are of much interest and of great beauty there can be no question, and it would be surprising were it otherwise, for the noble owner takes the keenest interest in them, and, as already indicated, they are under the charge of a gardener who possesses exceptional skill. The gardens abound in fine trees, handsome shrubs, attractive herbaceous borders, and an extensive water garden; and a comparatively recent addition is a Dutch garden, in which there is an excellent example of mural gardening. It is interesting to recall to mind that Mr. Kidd has from time to time taken part in the Scottish exhibitions, and has invariably proved a very formidable competitor, more especially with grapes. Mr. Kidd has shown his interest in the Royal Caledonian Horticultural Society in other ways than by contributing to its exhibitions, for he has had for some years the honour of occupying a seat on the Council of this venerable society which has done so much for horticulture in Scotland during the past hundred years.

"Gardeners' Magazine" Sweet Pea Number.—As previously announced, we shall devote the GARDENERS' MAGAZINE for the 22nd inst. chiefly to sweet peas and their cultivation. The contents will include articles on "New Sweet Peas for 1910," "Culture of Sweet Peas for Exhibition," "Sweet Peas in Scotland," "Sweet Peas in the Garden," "The American Sweet Pea Boom," "Decorative Uses of Sweet Peas," "A New Floral Hobby for Parsons," and "Sweet Peas in the Flower Garden." The number will be freely illustrated, and, in addition, a coloured plate will be presented of one of the finest of recent introductions.

Fruit Imports, 1909.—British markets were liberally supplied by fruits of foreign growth during the past year, and to those who believe in the possibilities of England as a fruit-producing country they will be regarded as larger than they should have been. The more important of the fruits that can be successfully grown in this country are apples, and of these 3,129,646 cwts., of the value of £2,007,911, were imported, these figures representing decreases as compared with the two previous years. Of apricots and peaches the imports were 52,724 cwt., of the value of £83,443, or a substantial increase, as compared with 1908. Bananas make a good showing, the number of bunches imported having been 6,238,065, and the value £1,752,190, or a slight decrease both in number and value. The imports of cherries aggregated 185,464 cwt., of the value of £210,679, or an increase of about 25,000 cwt., and a decrease of about £24,000, the low prices being due to the comparatively large crop that was gathered in England, and the wet weather that was experienced during the cherry harvest. Currants show a considerable advance both in quantity and value, the aggregate imports having been 131,442 cwt., of the value of £151,552. Gooseberries, on the other hand, were imported in decreased quantities, the total having been 27,078 cwt., of the value of £13,496. The imports of grapes were also on a considerably reduced scale, the total being 490,003 cwt., of the value of £508,111, or a decrease in quantity of about 182,000 cwt., and in value of about £220,000. Lemons were imported in slightly decreased quantities, while in the imports of oranges and nuts there were material increases. The value of the lemons was £475,967, and of oranges £2,522,491. The imports of pears amounted to 569,467 cwt., of the value of £504,423, these figures representing an increase in quantity of about 46,000 cwt., and a decrease in value of about £11,000. Plums also were imported in larger quantities, the total being 486,757 cwts., of the value of £474,749. Of strawberries, the imports were 36,829 cwt., of the value of £47,877, and the value of unenumerated fruits was £306,031, or a comparatively small increase as compared with the previous year. The total value of the fruit imports was £10,559,043, or an increase approaching £200,000, as compared with 1908, and a decrease of about £163,000, as compared with 1907.

Peter Barr Memorial Fund.—The members of the Executive Committee of this fund met at the Royal Horticultural Hall on Tuesday, January 11, and decided to issue an appeal to all admirers of the work of the late Mr. Peter Barr, V.M.H., for a sum of money sufficient to provide a gold medal annually, to be awarded by the Narcissus Committee in connection with work among daffodils, and for the maintenance of one orphan through the medium of the Royal Gardeners' Orphan Fund. Mr. William Marshall, V.M.H., is chairman; Mr. Henry B. May, treasurer; and Mr. C. H. Curtis, hon. secretary of the fund.

Gardeners' Royal Benevolent Institution.—The annual meeting and election of pensioners will be held at Simpson's, 101, Strand, London, on Thursday next, the 20th inst., when the chair will be taken by Mr. Harry J. Veitch, V.M.H., F.L.S., at 2.45 p.m. At 6 p.m. on the same day, at Simpson's, the annual friendly supper will take place, and at this gathering N. N. Sherwood, Esq., V.M.H., one of the trustees, will preside. The seventy-first anniversary festival dinner will be held at the Whitehall Rooms, Hotel Metropole, on June 22, under the presidency of the Hon. Harry L. W. Lawson.

Vegetable Imports were on a large scale during the past year, although there was a considerable decrease in two cases. The imports of potatoes were smaller than for several years past, the aggregate having been 4,282,866 cwt., of the value of £1,408,251. In 1908 the imports exceeded 7,000,000 cwt., and in 1907 they were 8,249,366 cwt. Of onions the imports were 7,470,775 bushels, a decrease of about 400,000 bushels. Tomatoes have on the other hand decreased in quantity, and increased in value, but the differences are not great. The total was 1,161,308 cwt., of the value of £954,400. Unenumerated vegetables continue to steadily increase, and the value of last year's imports was £402,739.

Kew Guild.—We are requested to state that it has been decided by the committee that the annual general meeting, to be followed by a social gathering, will be held at Kew this year on the Monday preceding the Temple Show, and not at the Holborn Restaurant as formerly. Old Kewites are further asked to note that, in accordance with the decision at the last annual meeting, the next "Journal" will not be issued until June, and will in consequence be a double number. Mr. A. Garnett has undertaken the duties of honorary secretary, pro. tem., and Mr. J. Coutts has been appointed honorary treasurer.

National Vegetable Society.—As previously announced in these pages the Duke of Portland, president of the National Vegetable Society, generously promised £10 as the first prize in the class for twelve kinds of vegetables at the society's exhibition in September next. We are informed that Lord Howard de Walden has very kindly promised to give a second prize of £7 7s. in the class, and that the committee hope to obtain a good third prize, as it is desired to ensure a very strong competition in this important class.

Withholding Prizes.—The importance of the exercise of the greatest care in the withholding of prizes in consequence of a supposed failure to comply with the conditions of competition, has been exemplified at Scone. It appears that, after the exhibition held by the Scone Horticultural Society last year the committee decided to withhold the prize of 2s. 6d. that had been awarded to an exhibitor of four tomatoes, on the ground that the visiting committee did not consider the tomatoes were of the exhibitor's own growing. The exhibitor threatened legal proceedings for the recovery of the prize money, and the parties after some correspondence agreed to submit the matter to arbitration, and appointed Mr. Edward Joss, superintendent of gardens, Montrose, the arbiter. After a consideration of the case submitted, Mr. Joss has made his award in favour of the exhibitor. He states that tomatoes can be successfully grown in an unheated frame by obtaining strong plants about the first week in June, and potting them on or planting them out on a bed of suitable soil. Then, if they are trained on wires a foot from the glass, fed and top-dressed when the first two trusses of fruit are set, and careful attention given to ventilation, watering, and feeding, to stopping the side shoots and pinching out the point of the main stem when it reaches the top of the frame, plenty of ripe tomatoes can be had by the third week in August.

A Good Record.—Mr. C. Medley, of Romsey, Hants, who has died at the age of ninety-one, worked in the Broadlands Gardens seventy-nine years, his first employer being Lord Palmerston.

Cross-fertilisation of Sweet Peas.—A correspondent of "Nature" writes: I have recently seen two further reiterations of the statement that the sweet pea is invariably self-fertilised, a statement which I think is often based on an opinion of Charles Darwin's. It may therefore be worth while placing on record an observation made by me in 1907, when examining daily and closely a large quantity of sweet peas. While Apis mellifica failed entirely to open the flower, it was done perpetually by Megachile willughbiella, and there was not the least doubt about the cross-fertilisation being effectively brought about by this bee. The point has probably been noted before, but it is worth recording once more in view of the repetition of statements as to the self-fertilisation of sweet peas.

Mr. G. F. W. Oman, who is retiring from the secretaryship of the Ancient Society of York Florists, states that during the eleven years he occupied the position of secretary, the sum of £568 1s. 9d. was received for special prizes; £2,025 17s. as subscriptions, and £526 9s. 6d. for advertisements. He also mentions that he received for salary during the eleven years £430, which is certainly not a large sum.

Want of Observation.—In speaking upon the all-important subject of nature observation, at a meeting held in Norwich, Mr. Rider Haggard expressed the opinion that, if a nation wanted to keep its virility, if it wanted to be able to match itself against foes, if it wanted to continue to thrive and breed healthy offspring, it must keep in touch with nature, and, to a certain extent, keep itself out of cities. Oddly enough, the people who lived upon the land are themselves often oblivious to the charms of nature. He thought it would be within the experience of many of them that the agricultural labourer, taken as a class, seemed to be singularly dead to the beauties among which he lived, and moved, and had his being. It might be that he really did delight in them, and that he did appreciate the beauty and loveliness of the morning and evening skies, the sound of running water, and the singing of the birds; but, if he did, then he kept it uncommonly close. But this was by no means confined to the agricultural labourer. He had known highly educated people who, although they had lived amongst rural scenes all their days, had not known the difference between an oak and an ash, or a thrush and a blackbird. That showed the want of observation. He believed they would find that unobservant people were unsympathetic people, although he did not say that this was always the case.

Beneficial Effects of Work in the Garden.—Speaking the other day at a public meeting Lord Hardwick stated that he knew a Duke who worked in his garden every day, and who, as the result, had muscles as good as those of a Billingsgate fish porter.

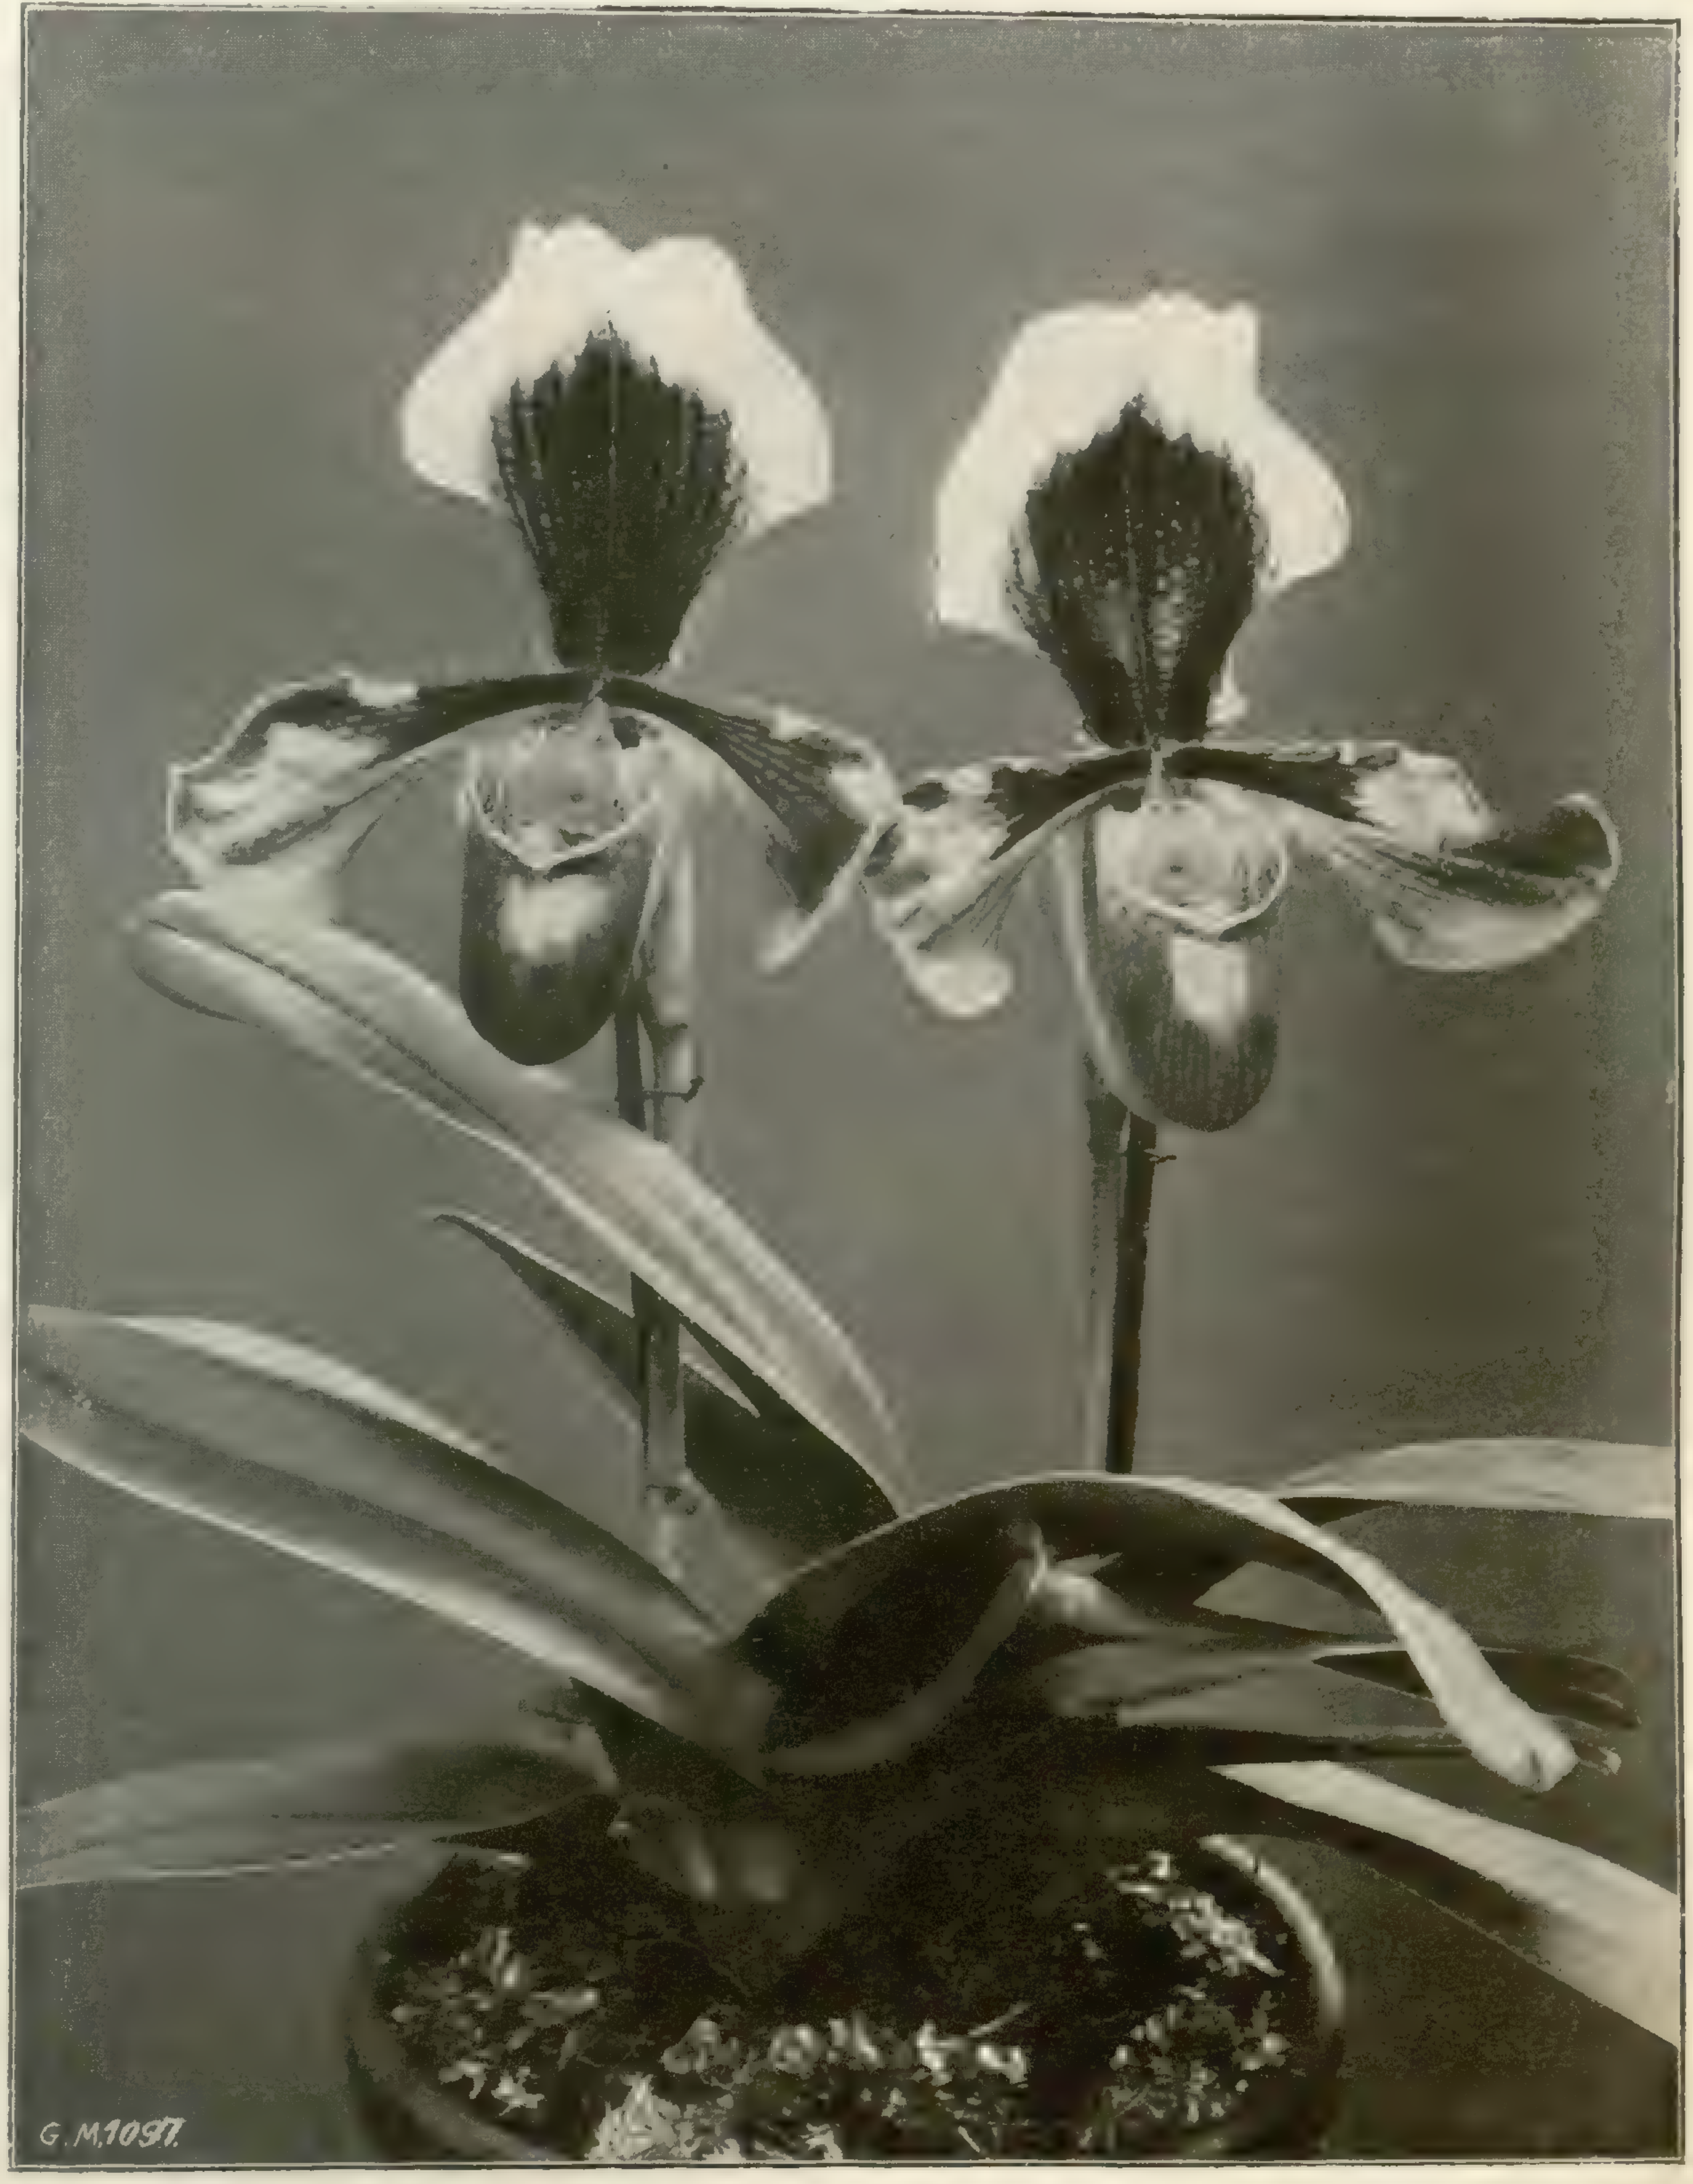
JOTTINGS: CRITICAL AND OTHERWISE.

The following sentence appears in an article on manuring lawns, in the volume of the GARDENERS' MAGAZINE for 1909, page 1,008: "I would advise that light and frequent dressings of lime and soot mixed be applied from time to time throughout the autumn, winter, and spring. Its effects are very beneficial, and most pronounced." Will the writer of the article, Mr. Walter H. Aggett, kindly go a step further and explain his reasons for mixing lime and soot together, because in the use of these two excellent materials the general advice is to apply them separately. As most people are aware, soot is a nitrogenous fertiliser, and when lime is brought into contact with it the immediate result of the mixture is the liberation of free ammonia into the air. One can always detect this by the pungent odour of ammonia in the air, and the sum and substance of the thing is that the fertilising property in the soot, i.e., the nitrogen, is driven into the air by the action of the lime, and wasted. Both soot and lime are good for lawns, but why use them together if the action of one spoils the fertilising properties of the other?

The members of the Bristol Gardeners' Association learnt something new at a recent meeting, when they were informed by Mr. Gostling, the lecturer for the evening, that fir needles were beneficial as a fertiliser for potatoes. If this is so, what a tremendous quantity of this product has been wasted in ignorance! Most of us, I am afraid, are in the habit of treating fir needles as a nuisance, and, for the most part, they are consigned to the rubbish heap. And, now, after all this, to learn that one might have grown potatoes with them, and saved the manure. It would be interesting, by the way, to know what particular fertilising properties are contained in fir needles, but, whatever they are, they do not appear to act beneficially on turf, hence the anxiety to get them swept up as fast as they fall. I hope the information given by Mr. Gostling fell on credulous ears, and that a trial of fir needles will be given next season when the potatoes are planted. Further, if this note catches the eye of Mr. Gostling, perhaps he will be good enough to favour the readers of the GARDENERS' MAGAZINE with the benefit of his experience in respect of fir needles as a potato fertiliser.

Two types of individuals are met with at gardeners' meetings, and other meetings as well, for the matter of that. One is the man who has got something to say, but cannot be induced to express himself, and the other is the individual who is so fond of talking that there is no stopping him, and nobody else has a chance. How to deal with the latter is a problem, but the Reading Gardeners' Association has adopted an idea for bringing the former out, and it promises to work well. At a recent meeting a list of questions was prepared, each one bearing a number, and when the chairman drew from a batch of tickets bearing corresponding numbers, and called one out, the holder of the number arose and spoke on the subject named on his question paper. The result was that members, including some young gardeners, who are not often heard, were induced to speak, and the interest of the whole proceedings was enhanced. I think that the departure made by the Reading Society might be followed by other gardening associations.

It is disappointing to hear that the Birmingham Chrysanthemum Society, after an existence of half a century, is in such a bad way that its future is a matter of grave concern. Mr. T. Humphreys, the treasurer of the old society, is no pessimist, but he recently pointed out the necessity of a change in the society's finances, which means, of course, that more support must be forthcoming if the Birmingham shows are to be continued. What is one to conclude from all this? Is it that the popularity of the chrysanthemum as an exhibition flower is waning, and that the interest of the public in "mum" shows is getting played out? It would appear like it, when the possible break up of a society like that of Birmingham is hinted at.



CYPRIPEDIUM BANTAM.

A handsome hybrid with large flowers, attractively coloured brown, crimson, yellow, green, and white. A.M., R.H.S. Lieutenant-Colonel Holford, January 11.

Gas tar as a preventive remedy for potato disease! There is something original about this, and it came about in the following manner. A cottager, so it transpired at a recent meeting of the Birmingham Gardeners' Association, last spring applied a heavy dressing of street sweepings to his potato patch, the sweepings being impregnated with the gas tar coating of the streets. The ensuing potato crop was entirely free from disease, and the assumption is that the gas tar must have been a potent remedy. I have heard the opinion expressed that sweepings from tar-sprayed roads are injurious to gardens, and it would be interesting to know if there is any further evidence forthcoming as to the action of tar-impregnated road sweepings as a preventive of potato disease.

In an editorial reply to a correspondent, on page 1,018, it is stated that in the experience of the GARDENERS' MAGAZINE and others the variety of black currant known as Boskoop Giant does occasionally become attacked with the bud mite. Well, a few years ago, a friend of mine thought he would make a fresh start, and be done with big bud for ever, so he planted some Boskoop Giants. He has lived to be disappointed, however, and when I examined his bushes of the above variety last spring I never saw a finer lot of fat buds, and the trees were covered with them. It was no question of a light attack, but a very severe one, and Boskoop Giant as a mite-resisting variety is a failure. At least, this is the conclusion I have come to. H.

NEW TREES AND SHRUBS.

The last of the issues of the "Kew Bulletin" for 1909 is of special interest to tree lovers for the notes by Mr. W. J. Bean on new trees and shrubs of Chinese origin, accompanied by illustrations of several of the kinds. We reproduce the notes in an abbreviated form:

The wonderful beauty and variety of the arborescent flora of Western and Central China, long ago suggested to us by the dried material of Mr. A. Henry and other travellers, is now being strikingly revealed by the living plants themselves. The present decade has witnessed the introduction to cultivation of a more remarkable assemblage of new hardy trees and shrubs than any previous one, even if we include the busiest years of such collectors as Douglas, Fortune, and William Lobb. Primarily, we owe this to the business enterprise of Messrs. J. Veitch and Sons, and to the liberality of Harvard University. Two expeditions on behalf of the former and one on behalf of the latter have been made by Mr. E. H. Wilson, an élève of Kew. The combination of qualities that have made him one of the greatest of plant collectors must be recognised as having had much to do with their success.

One of the most remarkable things about these Chinese introductions is the number of new and monotypic genera that there are amongst them. Apart from whatever beauty of flower or leaf they may possess, there is always a peculiar charm and interest attached to these solitary types. Most of the following are of this character, and it is thought that a few notes placing on record their first introduction to cultivation and a brief description of their leading features may be of some value to the growing number of cultivators of hardy trees and shrubs in the British Isles.

Carrieria calycina (Franchet).—A deciduous tree 20 to 30 feet (sometimes 40 feet) high, with a wide-spreading head of branches. Leaves ovate, up to five inches in length with a short acuminate tip, coarsely crenate. Flowers in terminal panicles six inches long, cup-shaped, one inch across, very pubescent, bluish-white. Fruit a capsule three to four inches long, covered with pubescence.

Mr. Wilson describes this tree as one of great beauty in flower. It was introduced by him for Harvard University, and from seeds presented to Kew by that institution this year small plants have been raised. It is a native of Central and Western China at altitudes of 2,000 to 3,000 feet. Of its hardiness nothing certain can be stated, but other trees and shrubs from similar elevations have proved capable of withstanding our winters. Monotypic.

Dipteronia sinensis (Oliver). — Although closely allied to the maples, this species is remarkably distinct, especially in foliage and fruit. It is a bush or small tree up to 25 feet in height, with deciduous pinnate leaves, about one foot in length on adult trees. The small white flowers are borne in erect pyramidal panicles nine to twelve inches long. The fruits are winged like those of a Wych elm or a ptelea, being flat, obovate, and three-quarter to one inch long.

This tree is growing well in Messrs. Veitch's nursery at Coombe Wood, and has recently been presented by them to Kew. It is undoubtedly hardy and, having a marked beauty of flower and leaf, as well as very interesting fruits, it should prove a most desirable acquisition to gardens. A native of Central China up to 5,000 feet.

Kolkwitzia amabilis (Graebner).—This is a deciduous shrub, five to six feet high, with opposite, ovate leaves, very pubescent. The flowers do not appear to have been seen by botanists but the fruits are quite remarkable. They are produced in short terminal clusters, each fruit about ¼-inch across, covered, like the pedicels, with numerous long, yellowish-brown bristles. This singular shrub has for several years been growing in the Coombe Wood nursery, having been introduced for Messrs. Veitch by Mr. Wilson. It grows in Hupeh on the watershed of the Han and Yangtse Rivers, among rocks at 9,000 to 10,000 feet altitude. Coming from these elevations it should undoubtedly prove hardy.

Prinsepia sinensis (Oliver). — When this shrub was first described by Professor Oliver as plagiospermum in Hooker's Icones Plantarum, t. 1,526, it was, in the absence of fruit, doubtfully placed in celastraceæ. That was in 1886, and since then not only has fruit become available, but the plant itself is in cultivation. It is now found to belong to prinsepia, a small genus of rosaceæ. Kew owes it to the generosity of M. Philippe de Vilmorin, who sent a small plant in the autumn of 1908 which stood uninjured in the Arboretum nursery during last winter, and is now very healthy.

This is a deciduous spiny shrub of lax spreading habit, now about six feet high with M. de Vilmorin at Verrières. Leaves alternate, oblong-lanceolate. Flowers bright yellow, produced singly on slender peduncles in few-flowered fascicles. Fruit red, resembling a small plum. A native of Manchuria, and appears to be a very attractive flowering shrub of a type quite new to gardens.

Poliothyrsis sinensis (Oliver), small tree, 30 feet or so high, with variable but more or less ovate leaves six to nine inches long, three to six inches wide, pointed and shallowly toothed. The flowers are greenish-white and borne in a large, erect panicle. The fruit is a dry, ellipsoid capsule, ¾ inch long, and thus very distinct from the globose, dark red berry of the Idesia.

Its fine broad leaves should make it a desirable lawn tree. It is common in Hupeh at 2,500 to 3,000 feet, and was introduced by Mr. Wilson for Harvard University in 1908. From seed presented to Kew by that institution a number of small plants have been raised, most of which survived the winter of 1908-9 planted out in the Arboretum nursery.

Sinofranchetia sinensis (Hemsley).—The Lardizabaleae section of this Natural Order is already represented in gardens by the asiatic genera Holboellia and Stauntonia, to which this new plant is allied. Neither of them is really hardy away from a wall or similar protection, whereas five plants of the Sinofranchetia in the nursery at Kew passed through the winter of 1908-9 absolutely unaffected by cold, although they were only young seedlings planted out the previous spring.

This is a large deciduous climber which covers trees 40 feet high. Its main stem is often three to four inches thick, and, after the fashion of its allies, the branches uphold themselves by twining round whatever support is available. The leaves are ternate, glaucous; the petiole six to nine inches long. The flowers are dull white, small and inconspicuous, and of no beauty. The fruits, however, are striking; they are borne in threes at intervals on an elongated rachis eight inches or more long, each fruit blue-purple, and about the size of an average grape. A native of Central and Western China, up to 7,000 feet, introduced for Harvard University.

Sinowilsonia Henryi (Hemsley).—A deciduous shrub or small tree occasionally over 20 feet in height. The leaves are broadly elliptic to obovate, rather like those of a lime, three to six inches long. The greenish flowers are in slender pendulous racemes nine inches long. Introduced by Mr. Wilson for Harvard University from Hupeh, China, where it inhabits the banks of mountain streams at altitudes of 3,000 to 4,000 feet.

Sycopsis sinensis (Oliver).—Although several species of Sycopsis are known, this is the only one hitherto found which is capable of withstanding our winters. There is no doubt it is perfectly hardy. Without any protection, young plants stood the winter of 1908-9 quite unaffected. It is an evergreen shrub up to 20 feet high, its habit, according to Mr. Wilson, comparable to that of our native hazel (Corylus avellana). The plant has little beauty of blossom, having short dense racemes of flowers, the most conspicuous feature of which are the red stamens. Native of the mountains of Central China at 4,000 feet.

Tapiscia sinensis (Oliver).—A small deciduous tree usually about 30 feet high, although one specimen found by Mr. Wilson was 90 feet high, with a trunk 12 feet in girth. The leaves are pinnate, 12 to 18 inches long. Flowers in axillary panicles four to six inches in length, yellow, quite small, with a pleasant honey-like fragrance. Young plants of this species from seed presented by Harvard University survived the winter of 1908-9 in the Arboretum nursery. Should it prove to be hardy, its fine pinnate leaves (changing to yellow in autumn) and its fragrant flowers should make it a welcome addition to our collection of small trees. A native of Western Szechuan and Western Hupeh at altitudes of about 4,000 feet, fairly common in the former province, but rare in Hupeh.

Tetracentron sinense (Oliver).—According to Mr. Wilson this is amongst the very largest of the broad-leaved trees of the Chinese forests (that is, excluding Conifers). It is often 80 feet and upwards high, with a trunk 20 feet in circumference. The Tetracentron bears a considerable resemblance to Cersidiphyllum japonicum, but is roughly distinguished by its invariably alternate leaves. It was introduced by Mr. Wilson for Messrs. Veitch about 1901, and presented by them to Kew. It is certainly quite hardy. The leaves are deciduous, broadly-ovate with a subcordate base. Flowers small, yellowish, in slender spikes about four inches long. A native of Central and Western China from 5,000 to 9,000 feet.

DECEMBER, 1909.

The last month of 1909 will be remembered for the various extremes of weather; perhaps more changes could not possibly have taken place in thirty-one days. Snowfall and rainfall during the month amounted to 6.49 inches with us. For the greater part of the month outside work was at a standstill, for either snow or rain fell on twenty-three days. The twenty-first was a very typical winter's day, clear sunshine, keen frost, and trees and everything around covered with snow. At sunset a change took place, clouds commenced to gather, and the wind began to rise, so much so that by midnight there was a terrible gale blowing. The morning of the 22nd was memorable for the hurricane of wind which caused the snow to form in immense drifts, and made locomotion exceedingly difficult, whether on railway, tramway, or for pedestrians, or vehicular traffic on the roads.

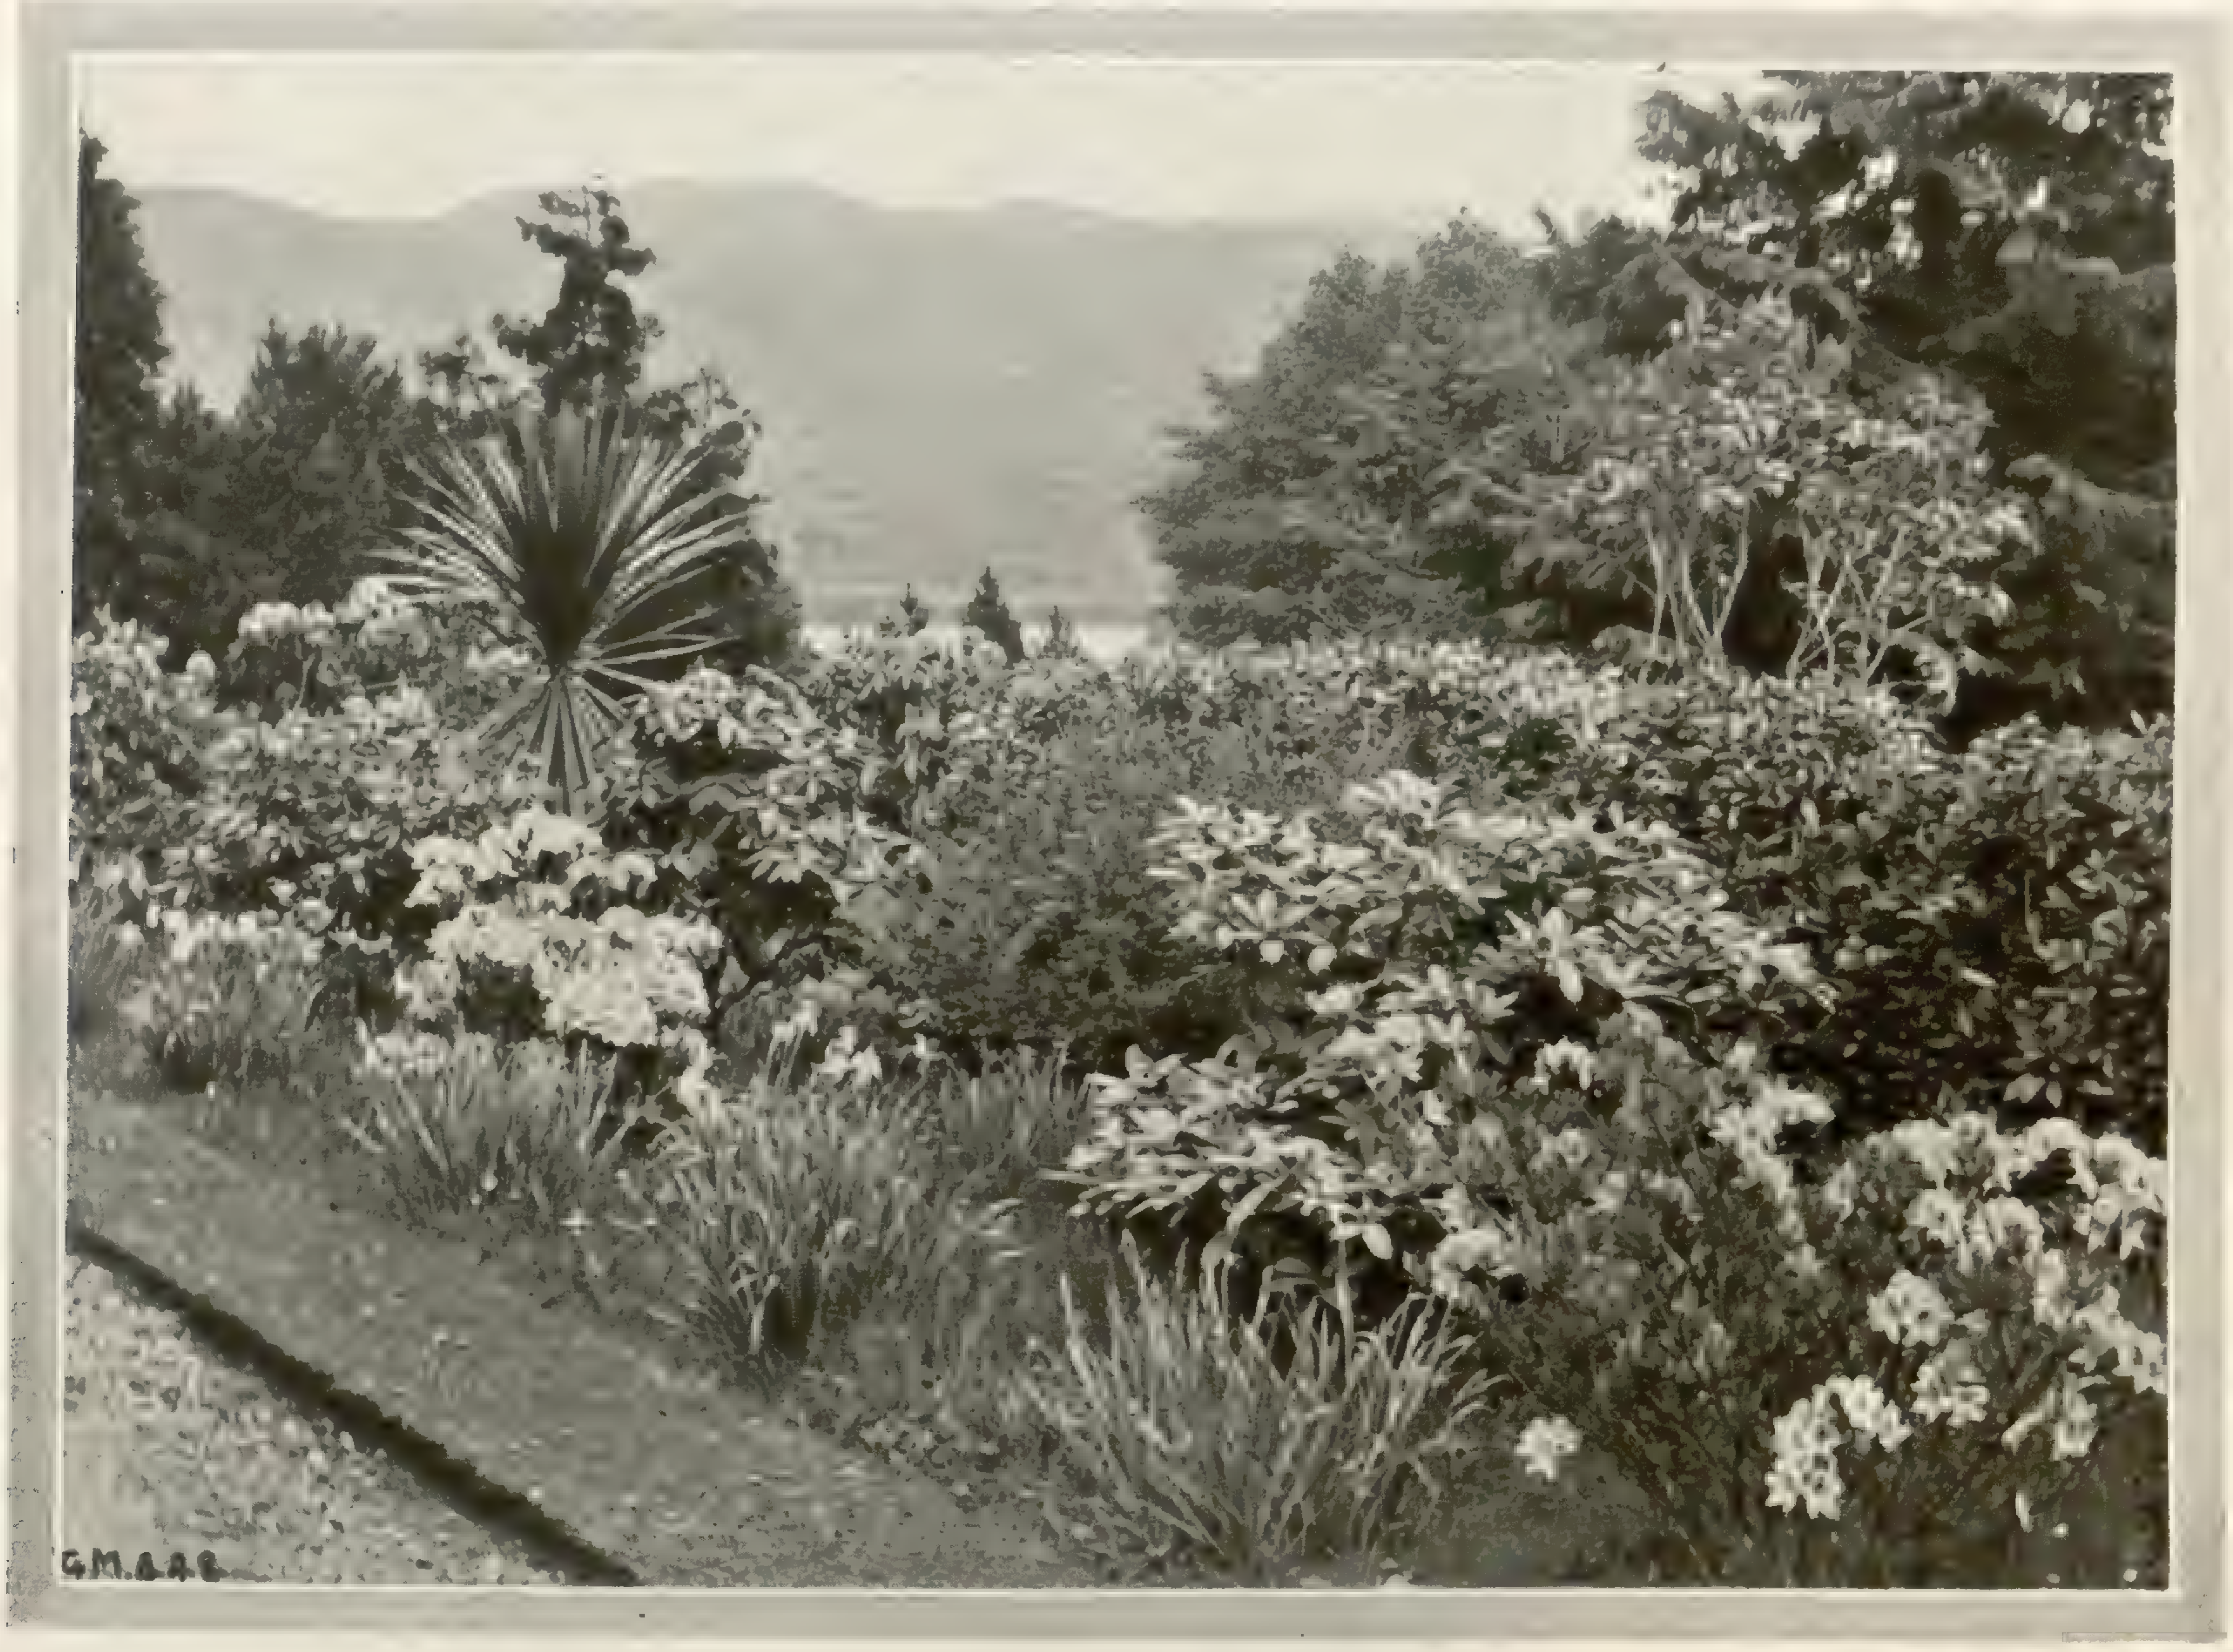
With regard to the garden the trees all added their quota of rotten sticks, and in many cases large boughs were torn off by the extreme violence of the wind. Never in my experience have I seen so many green leaves blown off rhododendrons, the grounds were literally strewn with them. I accounted for this, quite a phenomenal state of affairs, to the very sudden change in temperature, so sudden that there was not sufficient time for the branches to thaw. Consequently, the trees presented a rigid front to the violence of the storm, with the result that the leaves were ruthlessly torn off, and the ground bestrewed with them. In many cases the trees look rather naked and bare, but I do not think much real damage has been done. The toll of the storm was very great in different ways, as we have cleaned up many cart loads of debris.

Cheshire. W. M.

Potato Experiments.—In the Cirencester experiments in potato growing last year, described in the "Agricultural Students' Gazette" for December, a larger return was obtained from Irish than from Scottish seed tubers, though the produce of the former showed more disease. As regards the manuring trials, non-nitrogenous materials alone gave no increase of crop, while of the nitrogenous manures sulphate of ammonia was the best, but it is suggested that it should always be used in conjunction with superphosphate and generally a potash manure as well.

FLOWERING PLANTS IN THE WILD GARDEN.

The wild garden, with its distinctive charms and informal outlines, gives opportunities for natural grouping, that, if taken full advantage of, and suitable subjects utilised, cannot fail to make it an ideal portion of the country garden. There are so many diversities in a well-arranged wild garden, and at every other step one is confronted with the most delightful little scenic effect, which combines to make a most pleasing and interesting whole. Shady dells, where fern and foxglove foregather, emphasise with fulness the half-shady glades and the lightly wooded portions, where a perfect riot of scillas, anemones, narcissi, primroses, and a host of similar subjects cover the ground during the spring season with their wealth of beautiful blossoms.



[Photo: Miss S. M. Wallace.

A BEAUTIFUL EFFECT PRODUCED BY NATURALLY ARRANGED PLANTS IN AN IRISH GARDEN.

Open stretches and sun-touched slopes give an opportunity for a host of perennial plants, including shrubs, which would lose half of their beauty in shaded spots, while the lower margins, reaching to the flower-hung streamlet and the lily-strewn pools, open up great possibilities to the flower lover. Tennyson had truly caught up in his mind the charming effects of this wild garden beauty when he sings of

> "The tall flag-flowers when they sprung,
> Below the range of stepping-stones."

and one can picture with him the glories of the king-cups:

> "The wild marsh marigold shines like fire
> In swamps and hollows gray."

And no one will cavil at his appreciation of the wild waterside scenery, nor will they assuredly regard, in a much less degree, the water lilies which had such an influence upon the poet's thought.

But leaving the charms of the watersides, and noting the great possibilities of such subjects as the astilbes, spiræas, lythrums, epilobiums, and many others, in the beautifying of the moisture-laden margins, I would desire to devote a little space to many of our denizens of the perennial borders, with a view to their inclusion in gardens designed and planted on natural lines.

For instance, the open spaces and sunny drifts which present themselves at pleasing intervals could be devoted to great informal masses of delphiniums, bocconias, Michaelmas daisies, helianthus, heleniums, and similar subjects. Picture, if you will, the effect of the delightful blue spires of the delphiniums en masse in the sunlight, with a background, perhaps, of flowering trees, or the light greenery of birches and hazels.

Or, again, the soft delightful shades of blue, lavender, mauve, and white of the taller campanulas. Drifted masses, encroaching on either side of a wide informal pathway, with countless spikes hung with those satiny bells, and comprising such effective plants as C. grandis, C. persicifolia, C. macrantha, C. celtidifolia, etc., together with their beautiful varieties, a very wealth of beauty surely.

Glorious indeed are the rich, glowing masses of the Oriental poppies, when grouped boldly in sunny spots. Colours which are intensified by the softer colours and the greenery around them, yet harmonising delightfully withal, and giving that touch of Oriental brilliancy which seems to wake the garden to fuller light and life. Pæonies are very effective grouped on the grassland, their handsome foliage and imposing blossoms seem never more at home when thus naturalised, and one can employ such a range of beautiful forms and colourings, and arrange them to their individual fancy, or intermix them at will, that whatever the choice may be beauty will reign. Many other delightful subjects come to mind. Gaillardia grandiflora, with its rich gold, orange, and crimson colourings, is well adapted for naturalising, as also are the graceful linarias, especially the taller forms, such as vulgaris, dalmatica, and purpurea.

Irises are very effective in the wild garden, and of the bulbous forms the Spanish and English irises will do well in grass, if the soil is fairly good, while of the flag irises the Germanica section is especially suitable. Of these one should choose the stronger-growing sorts. The old common purple is useful, but more especially would I advise such handsome gems as dalmatica, Albert Victor, asiatica, flavescens, and Madame Chereau. For moister spots in the sunlight, one, of course, could utilise the handsome moisture-lovers, such as aurea, intermedia, gigantea, Monnieri, spuria, and others of the same type. They are, indeed, glorious, and well repay for planting in suitable spots

One might go much further, the list is indeed endless, and the combinations of flowering plants which one can effect are endless also. In the more open part of the wild or semi-wild garden the hardy azaleas may be successfully utilised in the production of colour effects late in spring. The charming garden on the margin of Lough Esk, co. Donegal, herewith illustrated, is a proof of this. It will be seen that the azaleas give a good succession to the flowers of the daffodils. Need I say more? It will assuredly be sufficient to point out the possibilities of the wild garden, saying, "This way lies beauty."

P. S. HAYWARD.

SHOULD FRUIT TREES BE CULTIVATED?

I note how sceptical is "G. H. H." on certain of the results of the Woburn experiments. In regard to the manuring of the trees I agree with "G. H. H." that the finest fruits come from trees manured in some form or other. Instances of the truth of this can be seen daily. I am sure that where trees are liberally manured annual crops of fruit are much more likely to be found than upon trees that receive little, if any, assistance in that direction. The reason is not far to seek. Trees growing under the latter category are weaker in every respect, and thus the blossoms of such trees do not fertilise nearly so readily nor so strongly, and the fruit cannot take its initial swelling in nearly so vigorous a manner as where the trees are stronger and have more energy. I have in my mind two examples of the truth of my views in this phase of the culture of fruit trees.

Some years ago I paid special attention to a bush tree of Lane's Prince Albert and one of Stirling Castle, annually using Thomson's vine manure as a spring top dressing, and frequently watering in the same stimulant during the summer. The result was free, healthy growth, no sign of canker in the latter variety, and abundance of very fine fruit on both trees. A change in the management took place, these two trees, along with the others, received ordinary treatment, pruning, digging about the roots, but no stimulative food regularly, in fact, seldom. The result is just an ordinary crop of fruit when there is a bountiful general crop. The second example is a small garden close to where I write, owned by an enthusiastic amateur who has abundance of stable manure at command. His apples are mainly espalier trained, and include, with others, Cox's Orange Pippin, Bramley's Seedling, Lord Derby, Worcester Pearmain, and suchlike. Manure in quantity is dug in about the roots annually, with abundant top dressings. The result is vigorous clean growth and liberal supplies of fruit every year. These two instances, apart from any other experience, are sufficient to convince me that trees are benefited by the aid of manure.

I am not an advocate of the non-pruning method, especially for newly-planted trees, and I am surprised when I see persons advocating it, when they know quite well the results that accrue from non-pruning the first year. Trees not pruned the first season after planting, especially standards, make but little growth for several years, and that of a weakly, indifferent character, surely that is a step in the wrong direction. What is required is a rapid growth of branch covering as wide an area as possible in the shortest possible time, and from which the greatest quantity of fruit will be obtained. Cutting back the main, in fact, all shoots to within a few eyes of the base induces a rapid, vigorous growth by concentrating the energy of the tree into a limited space.

The non-pruned trees, in their weakened condition of removal, cannot support the whole of the growths that are produced from the many eyes on the retained shoots, the result is the leading growth is puny from the terminal buds, while three parts of the shoot either forms fruit buds or the buds remain dormant. The advocates of this non-pruning method tell us the trees should be cut hard back the next year, when the trees have had time to recuperate from the check caused by transplanting! In these days of haste, when we wish to see full crops of fruit in the shortest possible time, surely this is not the way to obtain success. No, no, this advocacy will not do for me. I have planted and managed too many trees to ever think of such slow progress.

Hants. S.

WINTER SPRAYING.—No. II.

In a publication of this kind it is impossible to recommend any one of the various spray fluids which are manufactured for winter spraying to the detriment of others. Some of them rely simply upon the caustic action of the soda for their cleansing process, others combine paraffin with the caustic soda in some form, and others again substitute carbolic acid for the paraffin in combination with the soda, some to the extent of quite 60 per cent. of the material. The action of this last class on the moss on the trees seems a very gradual process indeed, so that one seems to have done no good at all for a month or two. The first time I used such sprays I was very disappointed, but I found the final result after six months was very good indeed, and now after a lapse of two years most of the trees are quite bright and clean, and can be easily distinguished from the unsprayed ones.

Unfortunately, the same cannot be said as far as my experience goes for a pure and simple caustic soda wash. I have frequently been much chagrined by the rapidity with which the trees took on their coat of green after being dressed with this wash. The paraffin washes are very excellent, and are not open to this objection; moreover, they make a splendid clearance of all Mussel Scale, American Blight, and such things, and probably give as big a percentage of mortality among Psylla eggs as any winter wash, but I greatly question if they have any direct action at all upon fungi, only indirectly by cleansing, and therefore destroying some amount of harbourage for spores.

In many ways it is a good thing that a winter wash containing much paraffin should have a lasting effect, as it would be, in my opinion, distinctly dangerous to the health of the tree to dress it with strong doses of paraffin winter after winter. The simple caustic wash can be easily made up by the operator, but all the others should be obtained from one of the many excellent firms of manufacturing chemists, whose specialised knowledge and up-to-date machinery enable them to combine the various ingredients much better than the mere layman possibly can.

Mr. Pickering's experiments at Woburn seem to point to the fact that the carbonate of potash which was formerly used with caustic soda in the old caustic alkali wash is unnecessary, the formula he recommends being 2 to 2½ lbs. of caustic soda (98 per cent. purity), dissolved in ten gallons of water. In his eighth report, however, he speaks of the rather dangerous nature of such strengths, and advises the provision of a basin of vinegar and water in readiness to bathe the face or hands if any should get on them.

The manufacture by many firms during the last year or two of machines which will successfully drive a heavy lime wash through comparatively fine nozzles without choking has rendered it possible, without any trouble, to cover every twig on a tree with a thick coat of lime. Various substances have been recommended for combination with lime, either for the purpose of increasing its beneficent effects or with the idea of making it more adhesive, so as to hinder the hatching out of Psylla eggs. In the former case salt has been used, also sulphur, while for the latter all sorts of substances have been tried, including resin, fish glue, waterglass, and treacle. The lime and salt wash is the most popular one, and it is in very general use in many of the fruit-growing districts, the addition of waterglass being often considered as scarcely worth the extra expenditure. It is made by taking 1 to 1½ cwt. of good flare lime, slaking it gradually, and then mixing it with 100 gallons of water in which 30 to 40 lbs. of salt have been dissolved.

Of course, it is necessary thoroughly to strain this compound, otherwise the taps and nozzles will be continually choked by small portions of lime. The greatest efficiency with these lime washes is obtained by delaying the application till the last day possible in the spring, so as to kill the hatching Psylla without damaging the opening buds.

In the spring of 1908 many trees were dressed in the middle of April, with very little damage to the buds, and splendid success with the destruction of Psylla. I have used self-boiled lime wash applied quite hot, without the addition of any other substance, and have had excellent results from it, both for its insecticidal value and for its adhesive quality. It was put on as thickly as it was possible to get it through a very powerful pump working at a pressure of 80 lbs. to 100 lbs. per square inch, and so hot that the hose pipes were almost too hot to hold in the coldest weather. It has been suggested that the reason for the excellent adhesion of this pure lime is that when applied to the tree it takes up carbonic dioxide from the atmosphere, and makes chalk upon the tree, which has been proved to be far more adhesive than if that substance had been sprayed on as chalk in the form, say, of whiting. Whatever be the reason I have found a good proportion of lime still on the tree eighteen months after, and then, not merely hanging in flakes, but firmly fixed on the tree, proving the efficacy of pure lime for this work. Unfortunately, the fungicidal value of this wash as a direct agent is absolutely nil, though probably a little better results would be obtained with a self-boiled lime-sulphur wash.

Where the fungus that causes the disease known as apple scab is known to be wintering in the bark of the young wood, a simple solution of copper sulphate at the rate of 4 lbs. to ten gallons of water used as a winter wash should do a good deal towards checking the disease, particularly if a quantity should remain on the bark, owing to the absence of heavy rains, until the spores germinate in the spring. Copper sulphate can be used with paraffin and caustic soda, so as to combine the insecticidal as well as fungicidal action, but this wash is too difficult for an ordinary person to make, and should be obtained from some manufacturing chemist. Whatever the wash used, care should be taken to use machines which will give the requisite force and penetration to perform the operation carefully and well, so that as little surface as possible escapes the spray. Do not spray immediately before rain falls if it can be avoided, and finally use every precaution to get as little of the wash as possible on the person or clothes.

Winter washing is not going to cure all the evils that fruit growers suffer from any more than is grease-banding or any other operation, but I am convinced that, properly carried out, it will materially reduce the amount of labour which has to be bestowed upon spraying in the summer, and so aid in the difficult work of successful fruit growing.

Burpee's

The Leading American Seed Catalog for 1910.

AN ELEGANT BOOK OF 178 PAGES.—it is "THE SILENT SALESMAN" of the World's Largest Mail Order Seed Trade. It tells the *plain truth* about the Best Seeds that can be grown,—as proved at our famous FORDHOOK FARMS,—the largest, most complete Trial Grounds in America. Handsomely bound with covers lithographed in nine colours it shows, with the six coloured plates, Nine Novelties and Specialties in unequalled Vegetables, and five of the finest Beautiful New Flowers, including two superb "Gold Medal" Spencer Sweet Peas.

With hundreds of illustrations from photographs and carefully written descriptions it is a SAFE GUIDE to success in the garden, and should be consulted by every one who plants Seeds, whether for pleasure or profit. While too costly a book to send unsolicited (except to our regular customers), we are pleased to mail it **FREE to every one** who *has a garden* and can appreciate QUALITY IN SEEDS. Shall we mail YOU a copy? If so, kindly *name this paper* and **write TO-DAY**!

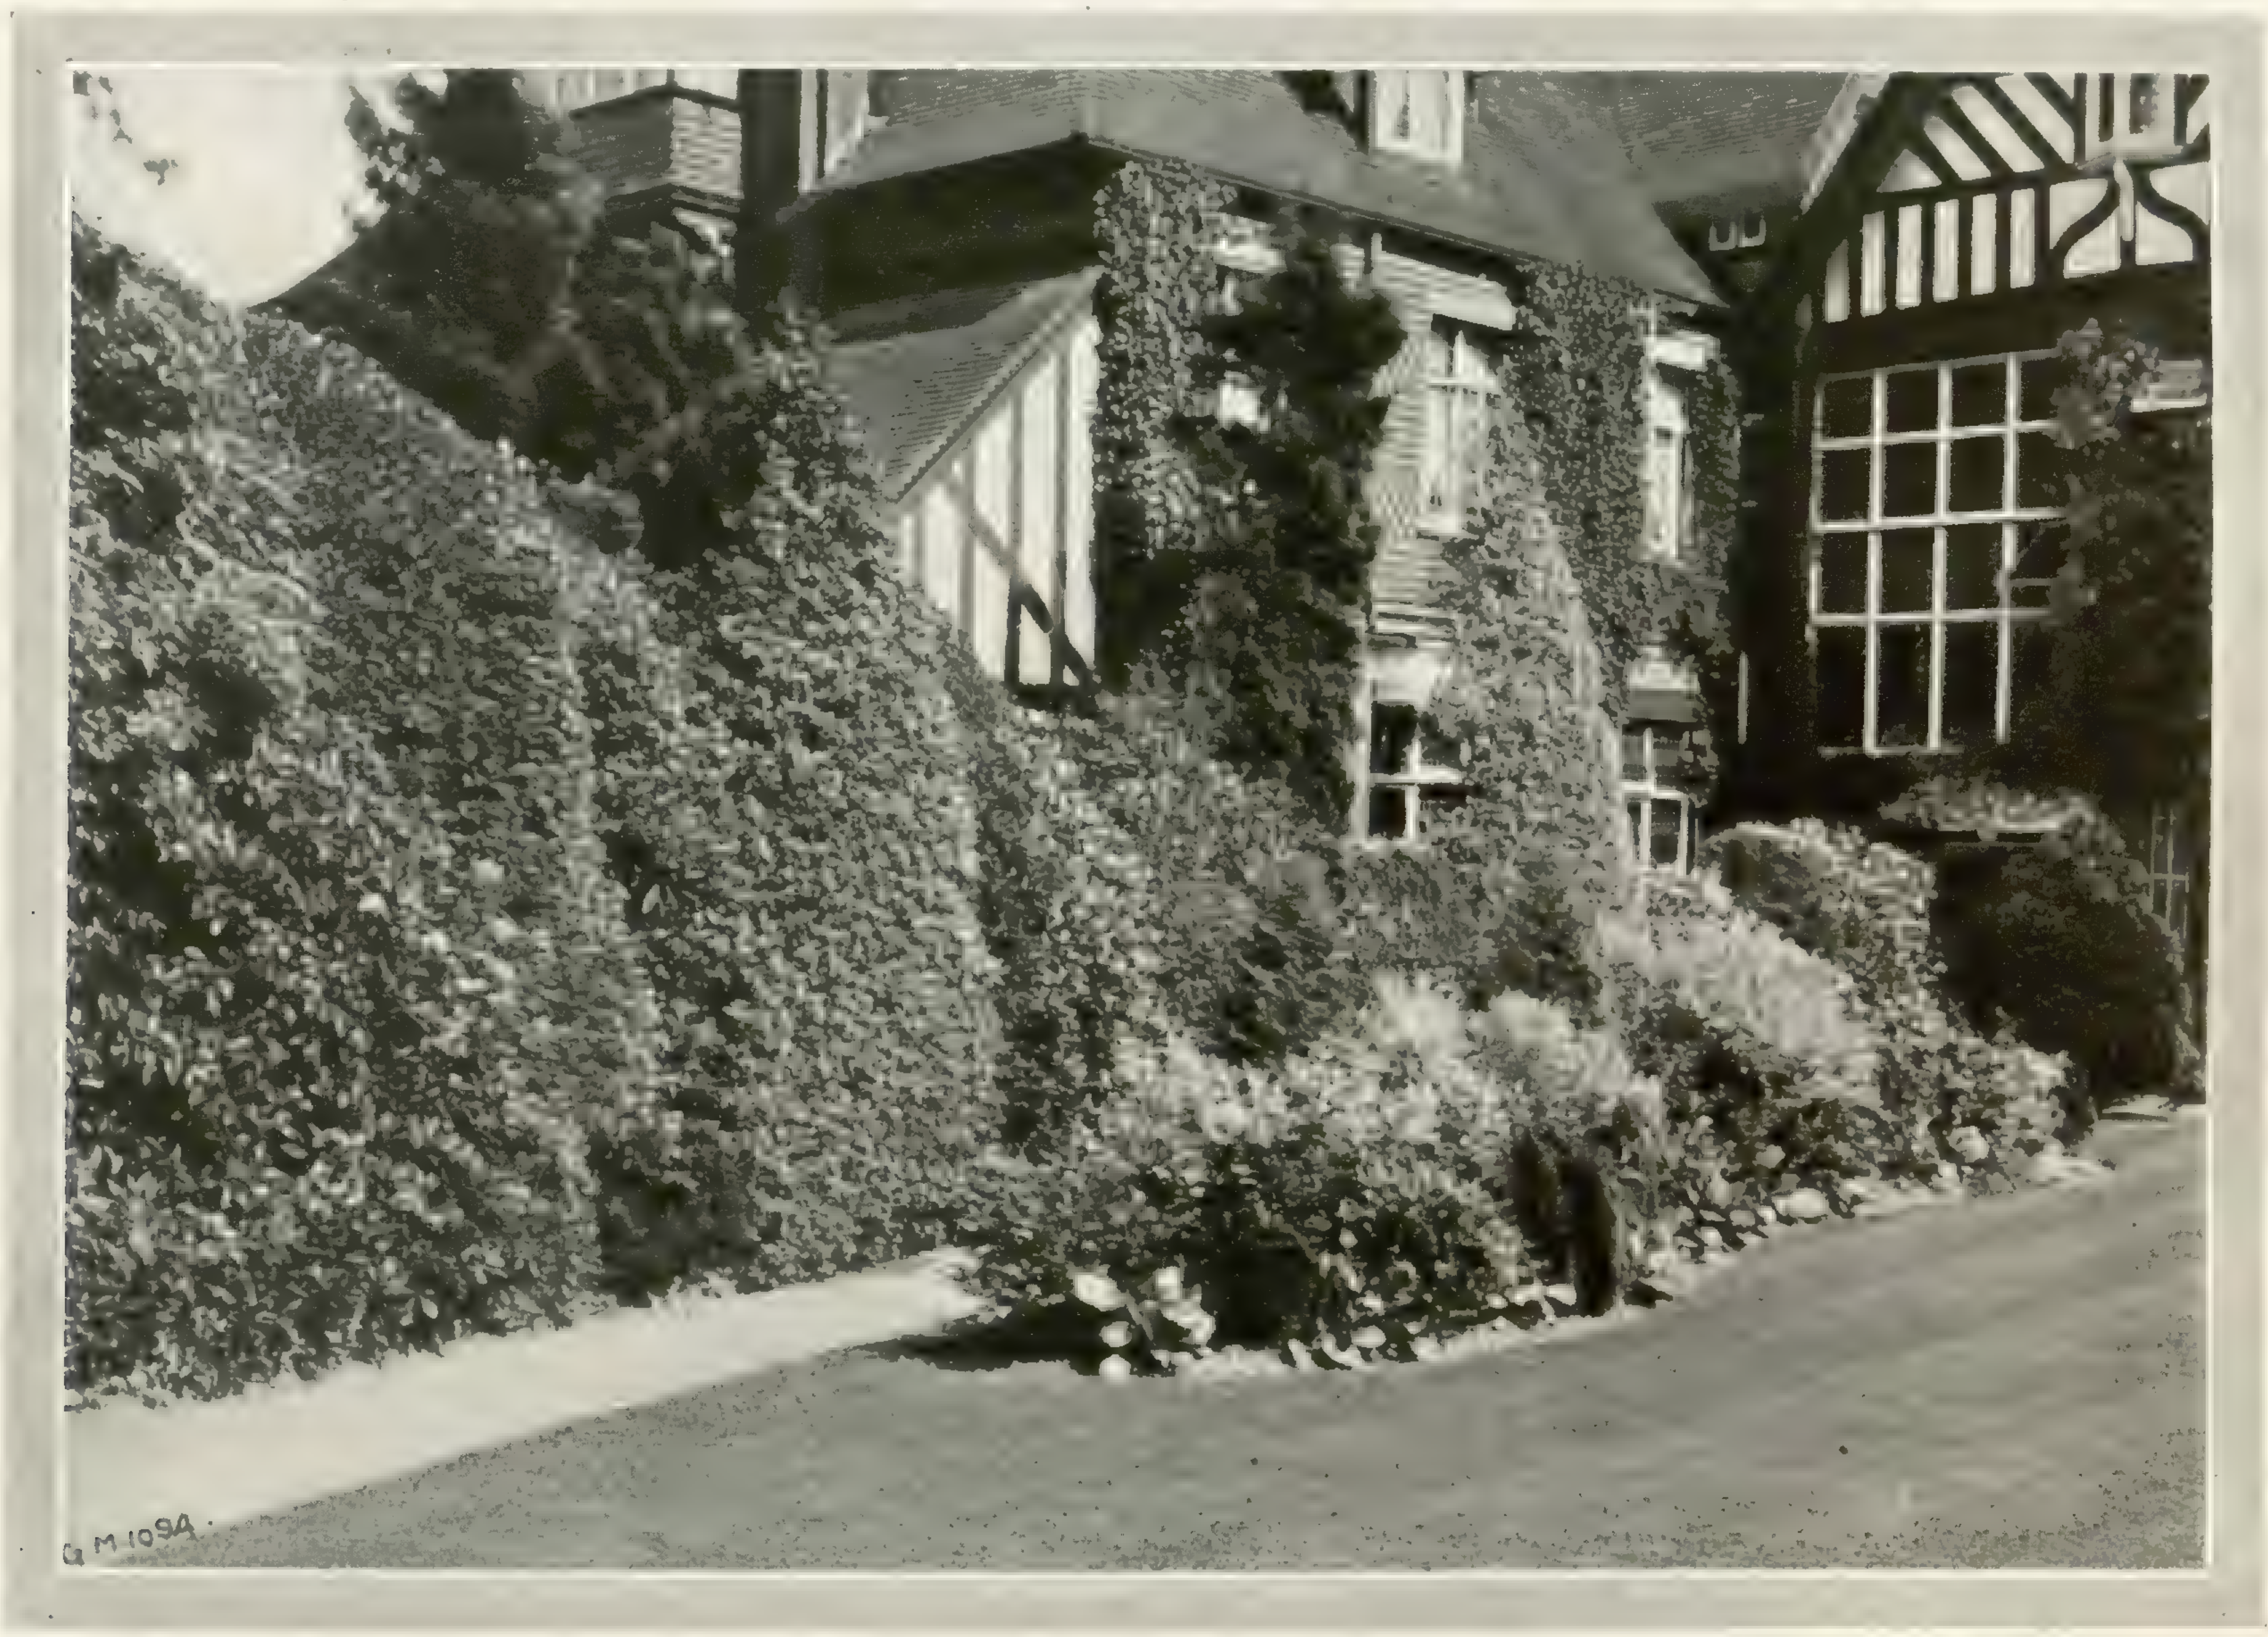
TWERTON HILL NURSERY, BATH.

SUCCESSFUL USE OF RICHLY COLOURED SHRUBS.

The value of trees and shrubs with effectively coloured foliage in garden scenery is well known to those who are actively engaged in gardening, and if not always so freely used as might be desired, there are usually reasons other than a want of knowledge of the finer kinds. In the planting of the grounds of Ely Grange, Frant, the residence of J. Waddington, Esq., they have been used freely, and with much success, and in walking through the beautiful gardens, the eye is charmed by the striking effects that have been produced by the judicious association of trees and shrubs with golden and silvery leafage with those having leaves of various shades of green.



AN EFFECTIVE ARRANGEMENT OF RICHLY-COLOURED SHRUBS
At Ely Grange, Frant.

It is not, however, to the general use of richly-coloured leafage in the Ely Grange gardens, but to the success that has been achieved in beautifying the space around one of the garden entrances to the mansion that we wish to refer. The walls of the mansion are of red brick, and the roof is covered with red tiles, and the colours have been softened to a very pleasant shade by time. On the walls are variously coloured ivies, and along the narrow border that skirts the mansion are variegated hollies that sparkle in the sunlight, and golden cupressus, which assume the richest of hues, and are singularly effective. In the large bed are shrubs of various kinds, with green, variegated and golden leafage, that combine to produce a colour effect at once rich and tasteful, and not less beautiful in winter than in the summer. The brightness of the colouring of leaves during the duller months of the year is perhaps one of the strongest recommendations that the free use of evergreen shrubs with highly coloured leafage in positions such as the one herewith illustrated could well be had. We may heartily congratulate Mr. Goldring on the success he has achieved in giving practical expression to his employer's wishes.

PLANTING.

To the gardener a knowledge of how to plant is essential, and should therefore be thorough. The experienced practical man will not require to be told how to do it, or how not to do it. It is the careless planter that should give thought to the subject.

Improper planting may not always be the fault of the planter, it may be that the workman has not had much experience in the work, or, on the other hand, he may proceed in a careless, or don't want to know manner.

Planting is a portion of the work of young gardeners, to which many of them might devote more attention than I fear they do. It is not merely digging a hole and putting in the tree or plant much as one might put in a stick, it is rather giving each tree ample room, the proper laying out of the roots in the direction they may incline to. The roots, which very often are in tiers, should be carefully laid out, the lower ones first, carefully covering these in and treading the soil placed over them before laying out those above, thus, as the work proceeds, covering each tier of roots and treading the soil firm until the proper height of planting is attained.

A varied experience of the work convinces me that proper planting is a very important factor in the future well-being of the subject planted. In carrying out the operation of planting I always prefer treading the soil firmly, except the soil just on the top, which, providing the tree or plant is made quite firm, should be left untrodden. This enables the air and water to pass down more freely to the roots. It is no uncommon thing to see the soil so firmly trodden or pounded on the surface that the water may be seen standing in pools, instead of passing down through the soil, and consolidating it.

There is also the proper height at which the plants or trees should be covered above the roots. Generally speaking, the roots may be covered about an inch, or rather the old ball of soil, which may hold the roots, should have an inch of soil over it. With roses and fruit trees, according to the stock they are worked on, the union should be covered in the planting. Trees of shrubs of any size should, after planting, be firmly staked, and in the case of standards three wires should be placed to them, triangular fashion, especially if subjected to high winds, for it is impossible for the roots to attach themselves in the land if the tree is allowed to move in any way after planting.

In securing all subjects against abrasion of the bark some soft material should be placed round the stems. For half or full standards, where they can be placed, and where one stake is sufficient for steadiness, the "Beckett" tree fasteners are admirable.

In so far as possible planting should only be done when the land is dry enough to be workable. Much depends on the nature of the land to be planted, whether light or heavy. If the land is not moved too much beforehand, and the rain has not penetrated deeply, planting will proceed under more happy conditions.

All newly-planted subjects should be frequently overlooked, and any movement from the vertical or other position should be rectified.

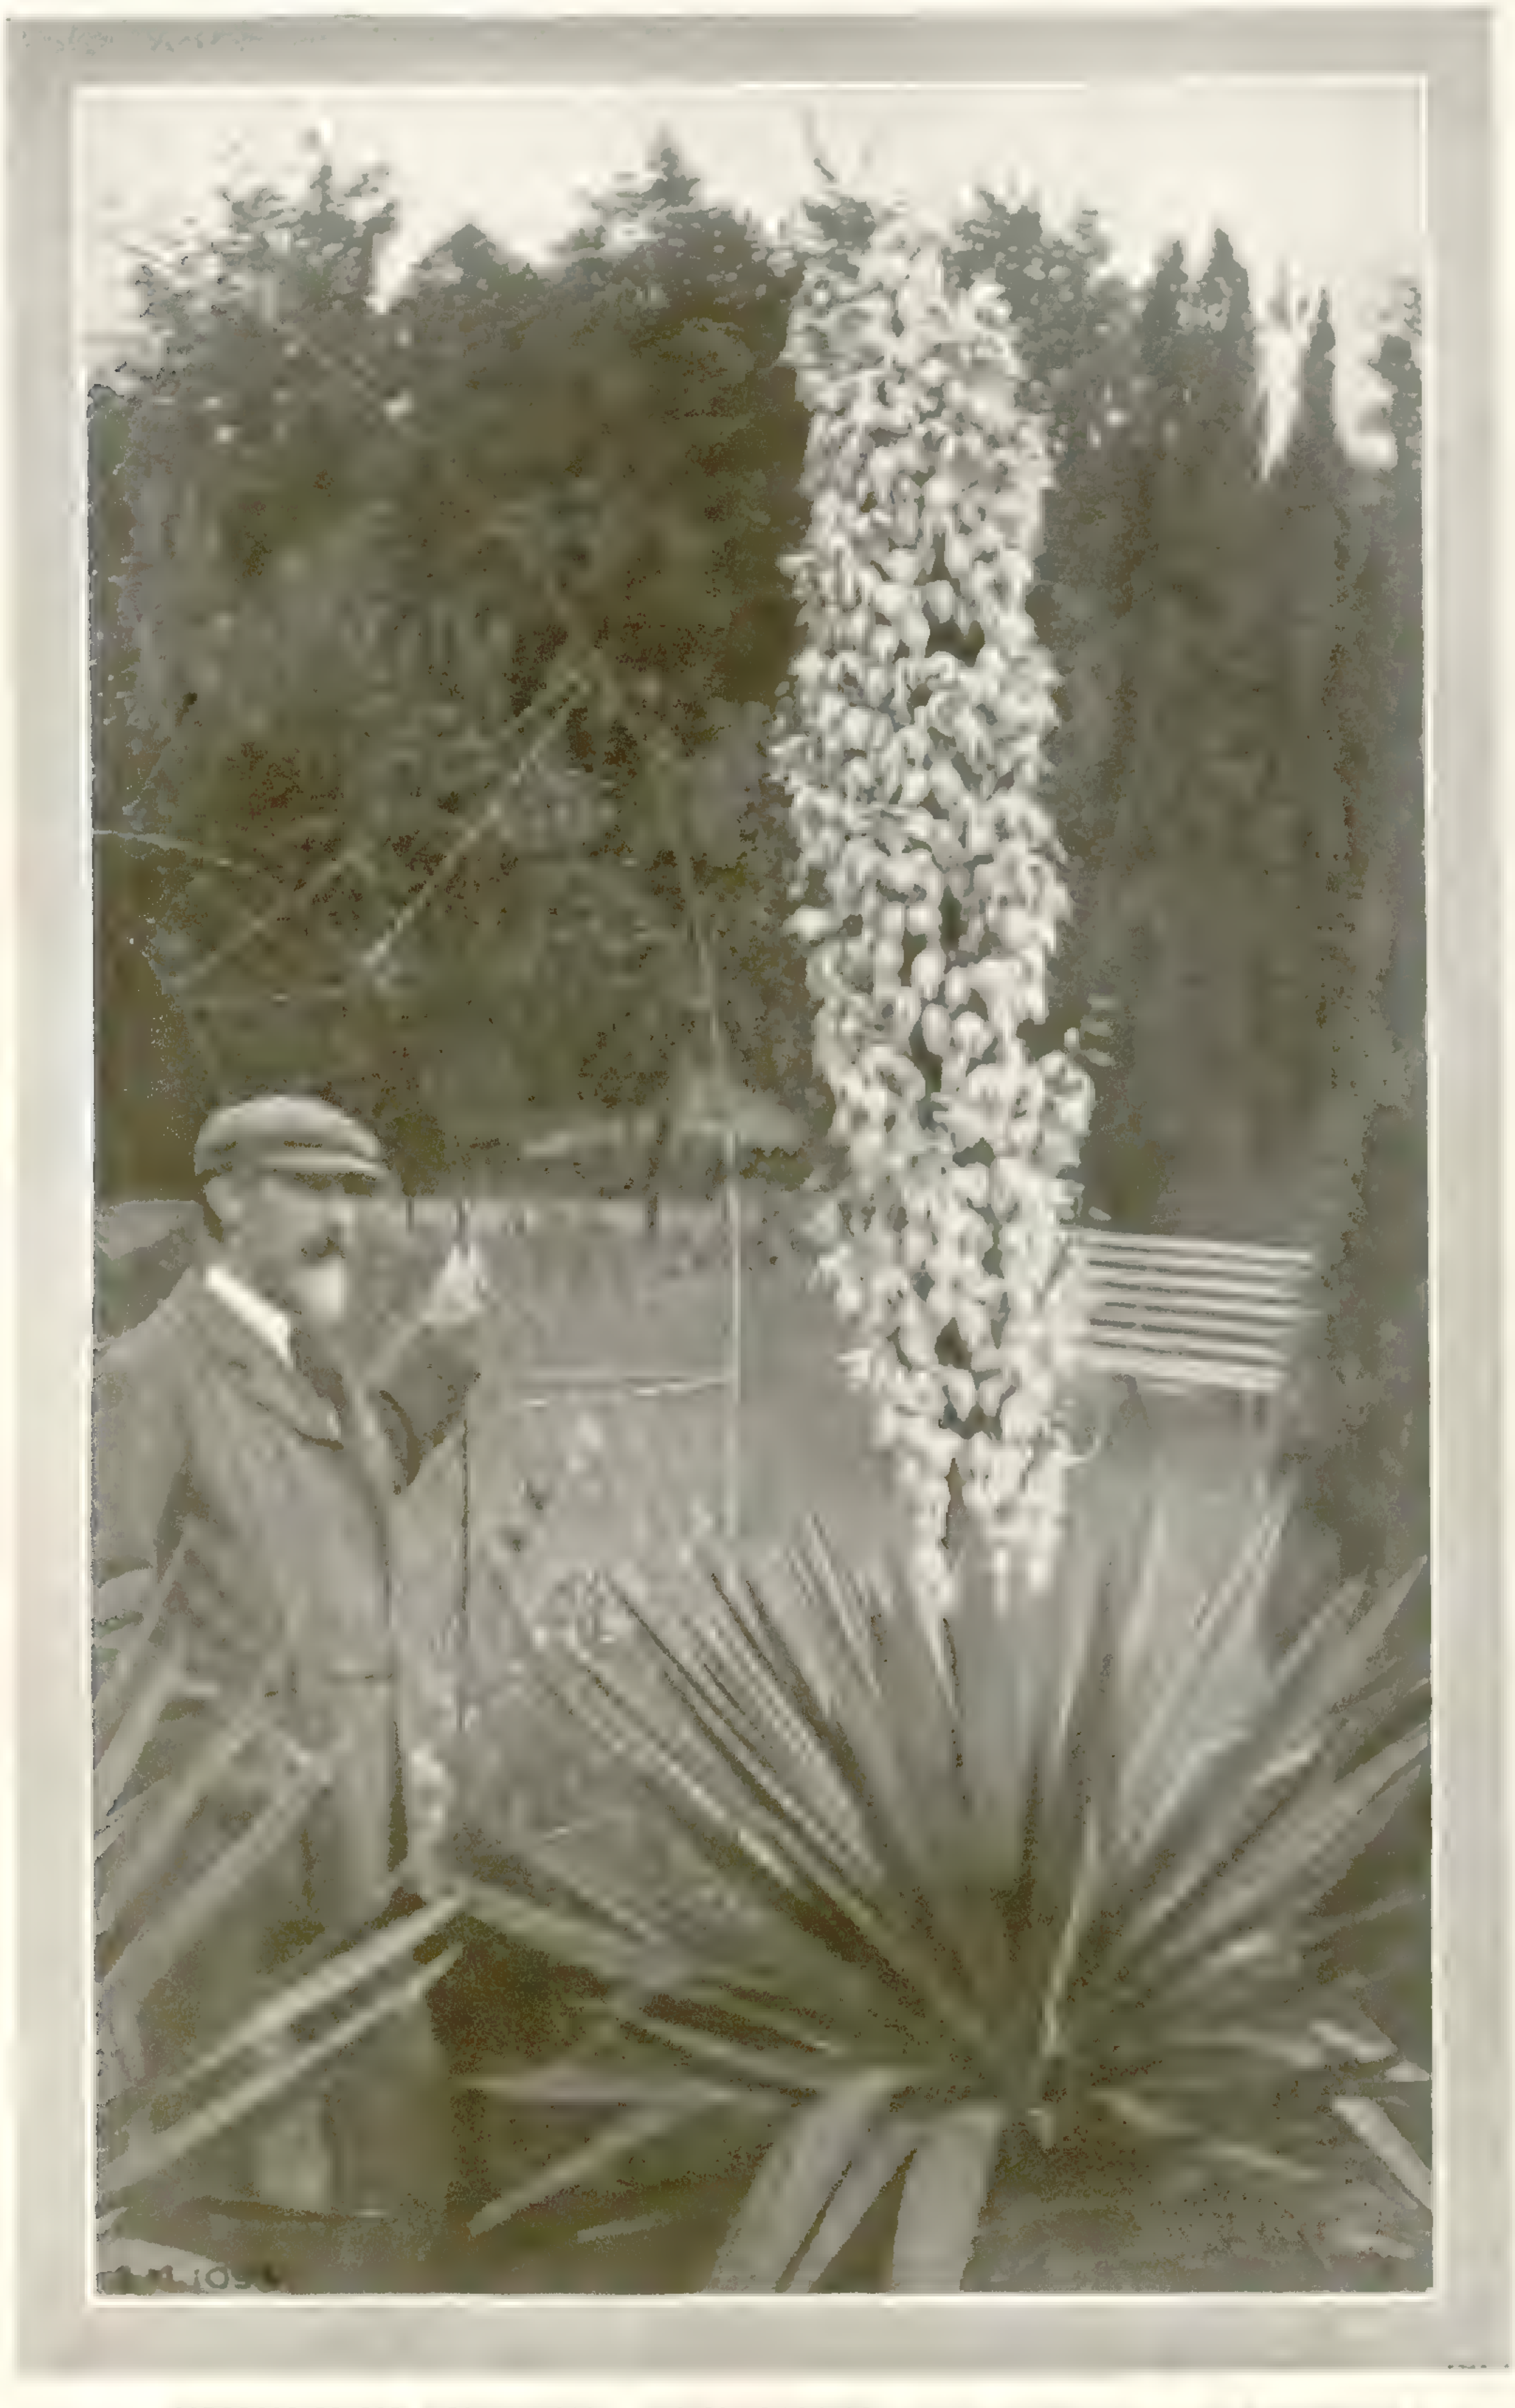
T. H. SLADE.

A HANDSOME YUCCA.

Adam's needle, as the well-known Yucca gloriosa is familiarly designated, is so distinct in character and tropical-like in appearance as to contribute materially to the attractions of gardens in which it has a place, provided suitable positions are selected. There should not be any great difficulty in selecting sites that are in every way suitable for the display of its distinctive charms, for whether forming part of a geometric arrangement in the flower garden, occupying a prominent position on the lawn, or grouped in the wild garden, it appears to be admirably adapted to its surroundings, and it invariably enhances the scene.

Occasionally a difference of opinion arises whether this species appears to the best advantage when grown singly, as in the case of the remarkably fine specimen that is herewith illustrated, or allowed to form large branched specimens. There is not, however, much in the different views that are sometimes expressed, because the question is one that largely depends upon environment. If the plants are to be utilised in beautifying a geometric arrangement of flower beds or a small garden that is formal in design, those with a single stem will be preferable, but for large lawn spaces and in the wild garden bold specimens with several stems will be the most effective, although they will not, as a rule, produce such finely developed flower spikes as the first-named. In some cases groups varying in size according to the space may with advantage be formed with plants having single stems, and if from five to seven are arranged in association they will form a feature that is at once distinct and attractive.

The cultivation of a few plants of this yucca will not involve a very large expenditure, or give rise to any difficulties in placing them under the conditions most conducive to their full development. The first essential to success is to select a position where they will enjoy a fair amount of sunlight, and the second to see that the soil is well drained. Should the soil be heavy a liberal addition of coarse grit and leaf-mould, when the sites are being prepared, will be an advantage. In low-lying positions it will be an advantage to raise the surface of the beds or sites from twelve to eighteen inches above the surface, and for keeping the soil in position either burrs or large rough pieces of stone, as may be the most readily obtained, can be used.



A FINELY-FLOWERED SPECIMEN OF YUCCA GLORIOSA
In the gardens of The Grove, Carisbrooke, Isle of Wight.

The splendidly flowered specimen we have the pleasure of illustrating is growing in the gardens of The Grove, Carisbrooke, Isle of Wight, the residence of A. L. Marvin, Esq. This yucca is, we are informed by Mr. Marvin, one of two offsets taken and planted by his gardener some ten years ago, and is generally regarded by those who have seen it exceptionally fine, both in growth and flowering. The illustration shows that the opinion held by Mr. Marvin's friends with regard to the development of the specimen is amply justified; we are unable to call to mind an example of Yucca gloriosa bearing so fine a spike.
G.

APPLE COURT PENDU PLAT.

For a period of ten years I closely watched the growth of two standards of this grand variety, and they did not fail to bear a good average crop each year. The tree is distinct from that of any other variety in growth, and the inner, or central branches bear more fruit than those similarly placed in other trees. My trees were generally in full bloom when those of a good collection of varieties had passed the flowering stage, and, in many cases, had set their fruits. Rarely were the blossoms of Court Pendu Plat damaged by frost on account of their lateness in opening. During the early part of summer it was a very difficult matter to distinguish the fruits from the leaves, even when close to the tree, so similar in colour were they. But as the autumn time came the fruits assumed a very rich colour, which deepened considerably after they were stored. The fruits are very even in size, rather flat, coloured the same nearly all over, and are of a very agreeable flavour from Christmas till April. This variety should be more largely grown. For the benefit of the inexperienced, I may add, the tree, when once established, should have good top dressings of manure, as the shoots mature well, as they are not very gross in growth.
G. B.

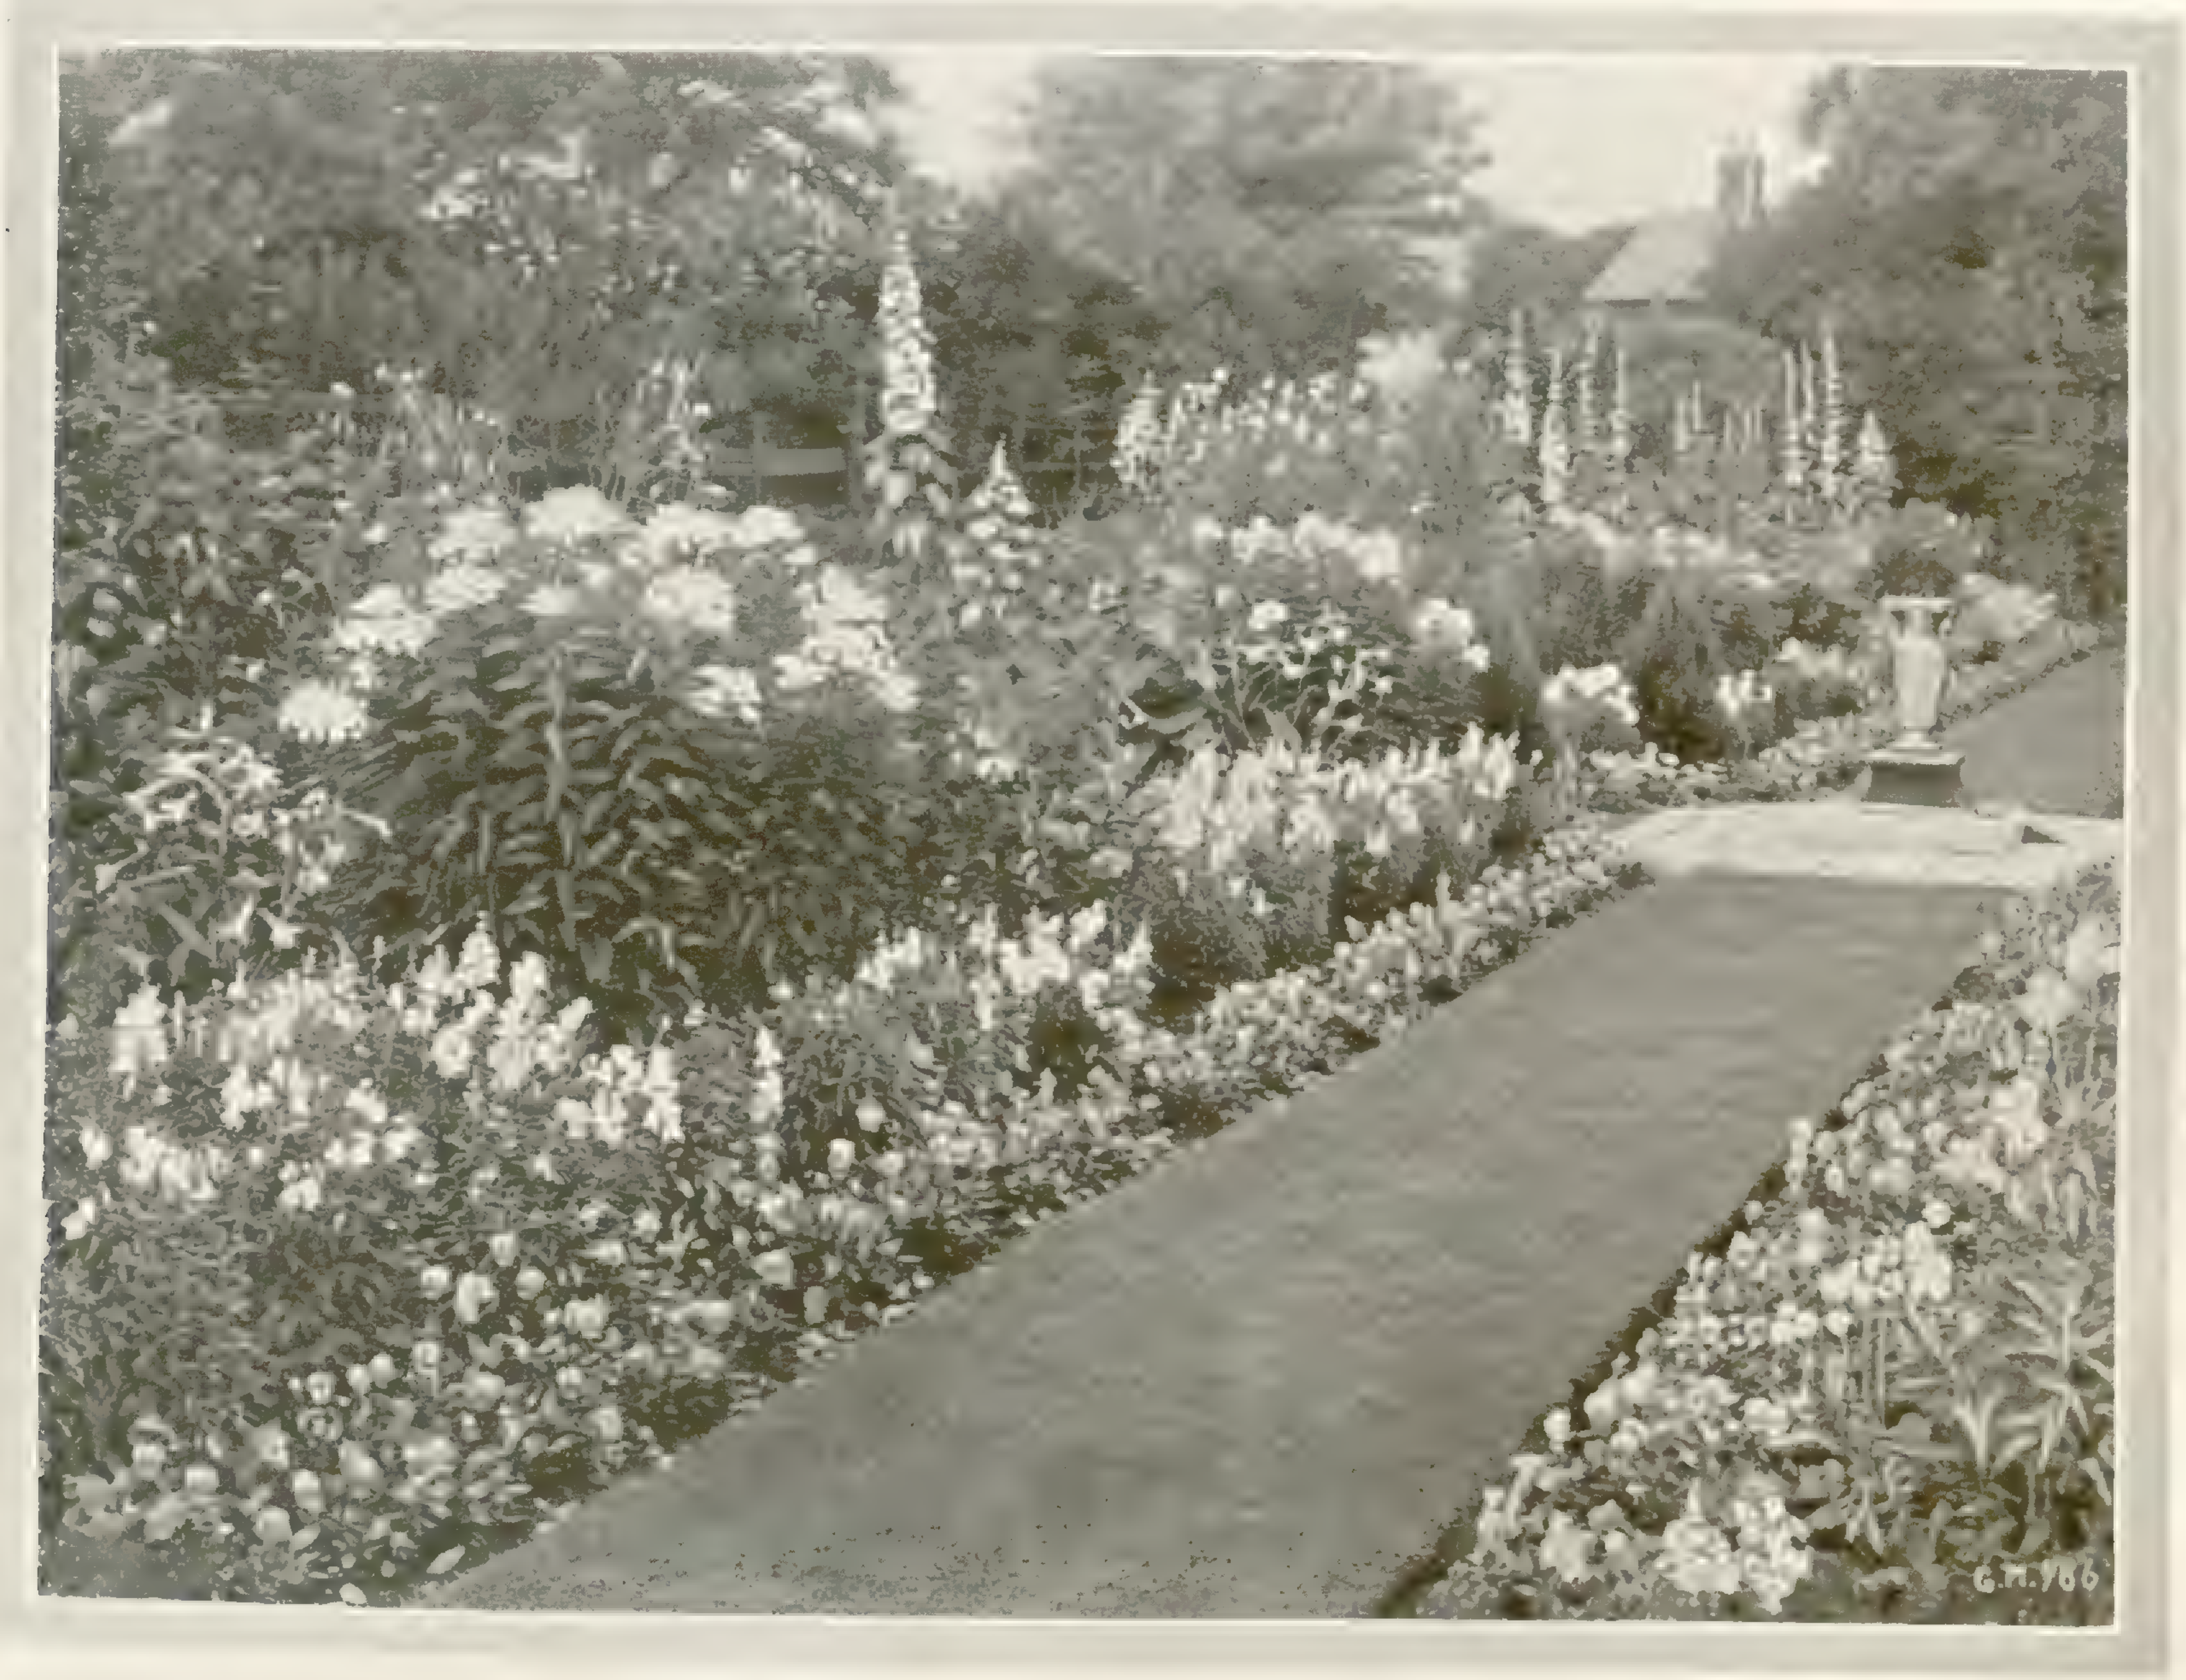
Accelerating the Ripening of Fruits.—For many years, according to the "Morning Post," the Arabs have applied cloths moistened with vinegar to bunches of dates in order to "sweeten up" unripened fruits. Following up this hint, Professor A. E. Vinson, of the Arizona Experimental Agricultural Station, has succeeded in ripening the fruit of a seedling date into a perfect commercial product in less than three days. The sprays of fruit are subjected to the vapour of acetic acid for twelve or fifteen hours. At the end of this time they have become nearly transparent and will ripen naturally without further treatment. The process can be accelerated by heating for some hours at a temperature of 45 deg. Centigrade. The process would enable dates to be shipped green, and their ripening to be effected artificially at the port of their destination. The fresh ripe date is very soft and prone to deteriorate quickly, while the unripe fruit is very firm and not easily bruised. The rapid deterioration is due largely to the inversion of the cane sugar of the date, and the fine flavour of the best dates—in the land where they can be eaten fresh—is due to the fact that the cane sugar has not been inverted but has remained as cane sugar. By artificially ripening dates at the destination they can be placed on the table with their full quota of cane sugar, and consequently of flavour.

A BEAUTIFUL BORDER OF FLOWERS.

There are not wanting writers who appear to regard the maintenance of borders chiefly devoted to hardy perennials in an attractive state after July has run its course as extremely difficult, if not impossible. The writers who hold this view state that there is an abundance of flowers throughout June and July, but with the opening days of August there is a considerable diminution, and that as the month runs its course the flowers so rapidly diminish as to closely approach the vanishing point by the end. It may be those who write thus have flower borders that are sadly wanting, both in interest and attractions, during the month in which the conditions are especially favourable to the full enjoyment of the garden, but if this is so the method of planting is at fault. To so arrange a border of hardy perennials that a continuous succession of flowers will be obtained is not the easiest of gardening matters. A thorough acquaintance with the finer plants, and judgment in selecting to ensure a proper proportion of early, mid-season, and late-flowering kinds, are essential to success in the arrangement of the various plants that should have a place in the mixed border.

If the knowledge and judgment suggested as necessary to the planting of a border that will give a succession of flowers is forthcoming, the task will be readily accomplished. The illustration of a border in an Essex garden may well be regarded as a proof of this. The owner is an amateur who devotes a considerable part of his leisure to his garden, and is careful to select subjects that possess much beauty, and thrive under ordinary conditions, and the example is one that might be followed by amateurs who are engaged in business or professional pursuits that impose a severe limit upon the time available for gardening. In this garden there is not at any period between the opening days of spring and the closing days of autumn any dearth of flowers, and there is invariably a rich display in the month of August, when the photograph of which the illustration is a reproduction was taken. There are, it will be seen, bold groups of herbaceous phloxes, stately hollyhocks, both single and double, glowing masses of antirrhinums, broad belts of violas that are simply carpets of flowers, and so on. There are, it will be seen, many other subjects, but for our present purpose it will suffice to point to those which can be readily recognised in the portion of the borders that came within range of the camera. The illustration is of interest as a successful example of grouping, but its greatest value is the proof it affords of the possibility of having an attractive display of flowers in the hardy plant border late in summer.

G.



A BEAUTIFUL BORDER OF SUMMER FLOWERS IN AN ESSEX GARDEN.

Onions.—It is now a recognised rule to raise a part of the plants for the onion crop under glass, as a great advantage is gained over those sown later in the open ground, the chief point being a longer season of growth, early maturity of the bulbs, and almost complete absence of the dreaded onion fly, which often attacks so severely those raised from seed sown in the open ground. The seed should be sown in well-prepared soil of a light character, in carefully-drained boxes, about the middle of the month. Place in a very gentle heat—a vinery or peach-house just closed answers admirably. On no account must too much fire heat be employed.—G. Ellwood.

A COLD FRAME IN WINTER.

A good frame may almost be regarded as one of the indispensable things in the smallest garden worthy of the name, but although almost everyone who takes gardening at all seriously possesses one or more, not everyone by any means seems to realise its possibilities of usefulness. As an extreme instance I might mention that quite recently someone to whom I was speaking on this subject said that his experience of putting plants in the frame for the winter was that when he went to look at them a month or two afterwards they were dead. The implied want of attention during that period of a month or two explains the loss of the plants, and apparently the owner did not remember whether the frame was open or closed during that time.

Management of an Unheated Frame.

First we will deal with the general management of the frame during the winter months, say, from November to March inclusive, irrespective of its contents. The ventilation of the frame is of supreme importance, air being scarcely less necessary during the winter except during periods of severe frost—than in the summer. If the sash or light is pushed all the way down, or pulled all the way up, during mild weather, the plants are likely to have that excess of moisture which is often more fatal to them than frost. When the plants have become dry, as they will do at any season if sheltered from the rain, removing the sash is one way, though not the best, of having them watered when the rainfall is sufficient, but otherwise the better way

MO. BOT. GARDEN
1911

is to water occasionally those pots that need it, and keep the sash in its normal position on the frame, raising it a couple of inches both top and bottom by inserting wooden blocks, saucers, seed pans, etc., so affording a current of air right through the frame.

If the sash is only raised at one end, as is usually done in summer time, there is apt to be stagnation of air at the other end unless the sash is pulled up for a time every day—and the result will be seen in many of the plants becoming weakly or mildewed. The frame may be left in this well-ventilated condition for weeks at a time in open weather, even 5 or 10 degrees of frost not necessitating closing it at night unless it contains rather tender plants or those which are rather less than half-hardy. During a sharp spell, or on any single evening when there seems likely to be more than 10 degrees of frost, it should be shut for the night, and opened again in the morning if the frost is merely a night frost, or likely to be soon dispelled by the sun. If it is severe winter weather it may be kept shut night and day, and even kept covered with sacking, mats, etc. In fact if the weather is severe enough to justify its remaining shut it is best kept covered up also, thus keeping the plants in a more or less frozen condition, when they will take no harm. When the sun reaches the frame, even during a sharp spell of frost in midwinter, it thaws the plants and causes evaporation, with the consequent risk of mildew. Nothing is more fatal to plants than being thawed by the sun in a closed frame.

Advantages of the Unheated Frame.

We will next deal with the uses of the frame. There are many hardy or half-hardy plants which, in cold, damp soils and situations, often fail to stand the winter, and of these may be mentioned such old favourites as pentstemons, eschscholtzias, antirrhinums, sweet peas, Lobelia cardinalis, scabious, gaillardias, and Iceland poppies. Such may be potted up in the autumn, or, better still, seedlings of them raised in the summer may be grown on in pots, or, in the case of pentstemons and antirrhinums, cuttings grown on in the same way, and all put in the frame to be ready for the first sharp frost, which is generally to be expected soon after November comes in. And not only may such plants be kept from excess of cold and wet in this way, but they may be preserved from the ravages of slugs if the bed of the frame is properly prepared beforehand. This may be accomplished by thoroughly liming the surface of the soil where the frame is to be placed, two or three times at intervals of ten minutes, on a damp morning, and then, when the frame is put in position, or before if preferred, a three or four-inch layer of cinder ashes over the bed will make the frame pretty nearly slug-proof for the winter if slugs are not put in with the pots, each of which should be carefully inspected before being put in.

If annuals are raised in pots such a frame is very useful for storing some of the hardiest, which would otherwise fall victims to the slugs, among which may be mentioned cornflowers, sweet sultans, clarkias, Bartonia aurea, larkspurs, lupins, Dianthus sinensis, annual chrysanthemums, and the like. No less useful is it, too, for keeping stools of early-flowering chrysanthemums, which, in a slug-infested soil, so often fail to produce any cuttings in the spring, or even to survive at all. A few plants of favourite sorts, if potted up or put in boxes, and kept free from slugs before they have suffered too much already in the autumn, will provide abundance of cuttings. Lastly, a cold frame with a good bed of cinder ashes is the best place for pots of bulbs during the autumn and early winter. They should be completely immersed in the ashes as soon as potted—the sooner after August the better—and then taken out a few at a time, as wanted, to force in the greenhouse, or to grow on more naturally in the frame, remembering to shade them from full sunlight for a week or so after the callow shoots are exposed to the air. An inverted flower pot over each pot of bulbs is not a bad device, enough light entering through the drainage hole of the protecting pot to serve for a few days.

Arrangement of Occupants.

If one has a couple of frames or more it saves some little trouble and attention if those plants which simply need protection from slugs or excessive wet are put in a frame by themselves, as then there need be no question of shutting or covering up that frame except in very severe weather, such attention being confined to the one containing the half-hardy plants. Those with no other glass than a cold frame may grow many pots of flowers for indoor decoration, beginning with Roman hyacinths and snowdrops in January, and continuing with narcissi and hyacinths in March, and tulips and various members of the primula family in April. Other plants which lend themselves admirably to the slight expediting which even a cold frame affords if put in a sunny corner of the garden, are Dielytra spectabilis, Lenten roses, wallflowers, Solomon's seal, and violas. Alger Petts.

THE DOUBLE BULLATE CROWFOOT.

Of the various double crowfoots which we find cultivated in gardens that named Ranunculus bullatus plenus is probably the most ornamental and showy. It reminds one in some ways of the double calthas, or marsh marigolds, but is more refined in its way than they, and is better suited to the border. The plant forms a neat bush a foot or so high, having pleasing green leaves, and a number of prettily imbricated double flowers of a good yellow, approaching to orange in their hue. It is a flower which comes from the Mediterranean region, but is perfectly hardy with us. I have known it for many years, and in no case have I ever been aware of its suffering from the effects of the most intense winters we have experienced. Like many of its family, the double bullate crowfoot likes a rather strong soil, but it is not insistent upon this, and I have grown it well in a sandy soil, when no stronger one was available at the time. It flowers in summer, gives us its handsome blooms for a considerable time, and is very readily increased by division, either in spring or after its flowering period is over. S. Arnott.

Chrysanthemum Mrs. L. Thom.—This Japanese variety came from Australia some three years ago, but has not been seen in good condition until the season just past. It is a loosely incurving variety, building up a large bloom possessing much quality, while its colour, soft canary-yellow, is all that could be desired. Now that first-class blooms of this type and colour are not over-plentiful, exhibitors would do well to include this variety in their collection. Naturally an early-flowering variety, it should be propagated quite late, and stopped once, securing the first crown bud on single-stemmed plants.—E. M.

EXHIBITION ONIONS.

The craze for cultivating large onions seems to be increasing rather than diminishing year by year, and the original champion growers of this useful and wholesome bulb are adding to their numbers. The fact that soil conditions and high-class cultivation are to a large extent responsible for success is demonstrated when we sow a pinch of the same stock of seed in barren soil and in rich soil for comparison; the former crop attains a size no greater than that desired for "picklers," while the latter produces moderately-sized bulbs.

Soil Conditions.

It is useless to attempt the cultivation of large exhibition bulbs unless very special preparation is given to the soil, and needless to say, as in the cultivation of many other plants, some soils seem to be naturally adapted to the cultivation of the onion. In this district of Basingstoke, I was impressed many years ago by the excellence of the onions grown by Mr. Bowerman, of Hackwood Park, and by Mr. Kneller, of Malshanger, and other gardeners in the neighbourhood. Finally, I was filled with a desire to try what soil of a similar character a little further afield would accomplish; the result was that within two years I found little difficulty in growing onions averaging two pounds in weight. A few turned the scale at 2½ pounds, and one well-formed bulb weighed exactly 3 pounds 5 ounces.

Sowing the Seeds.

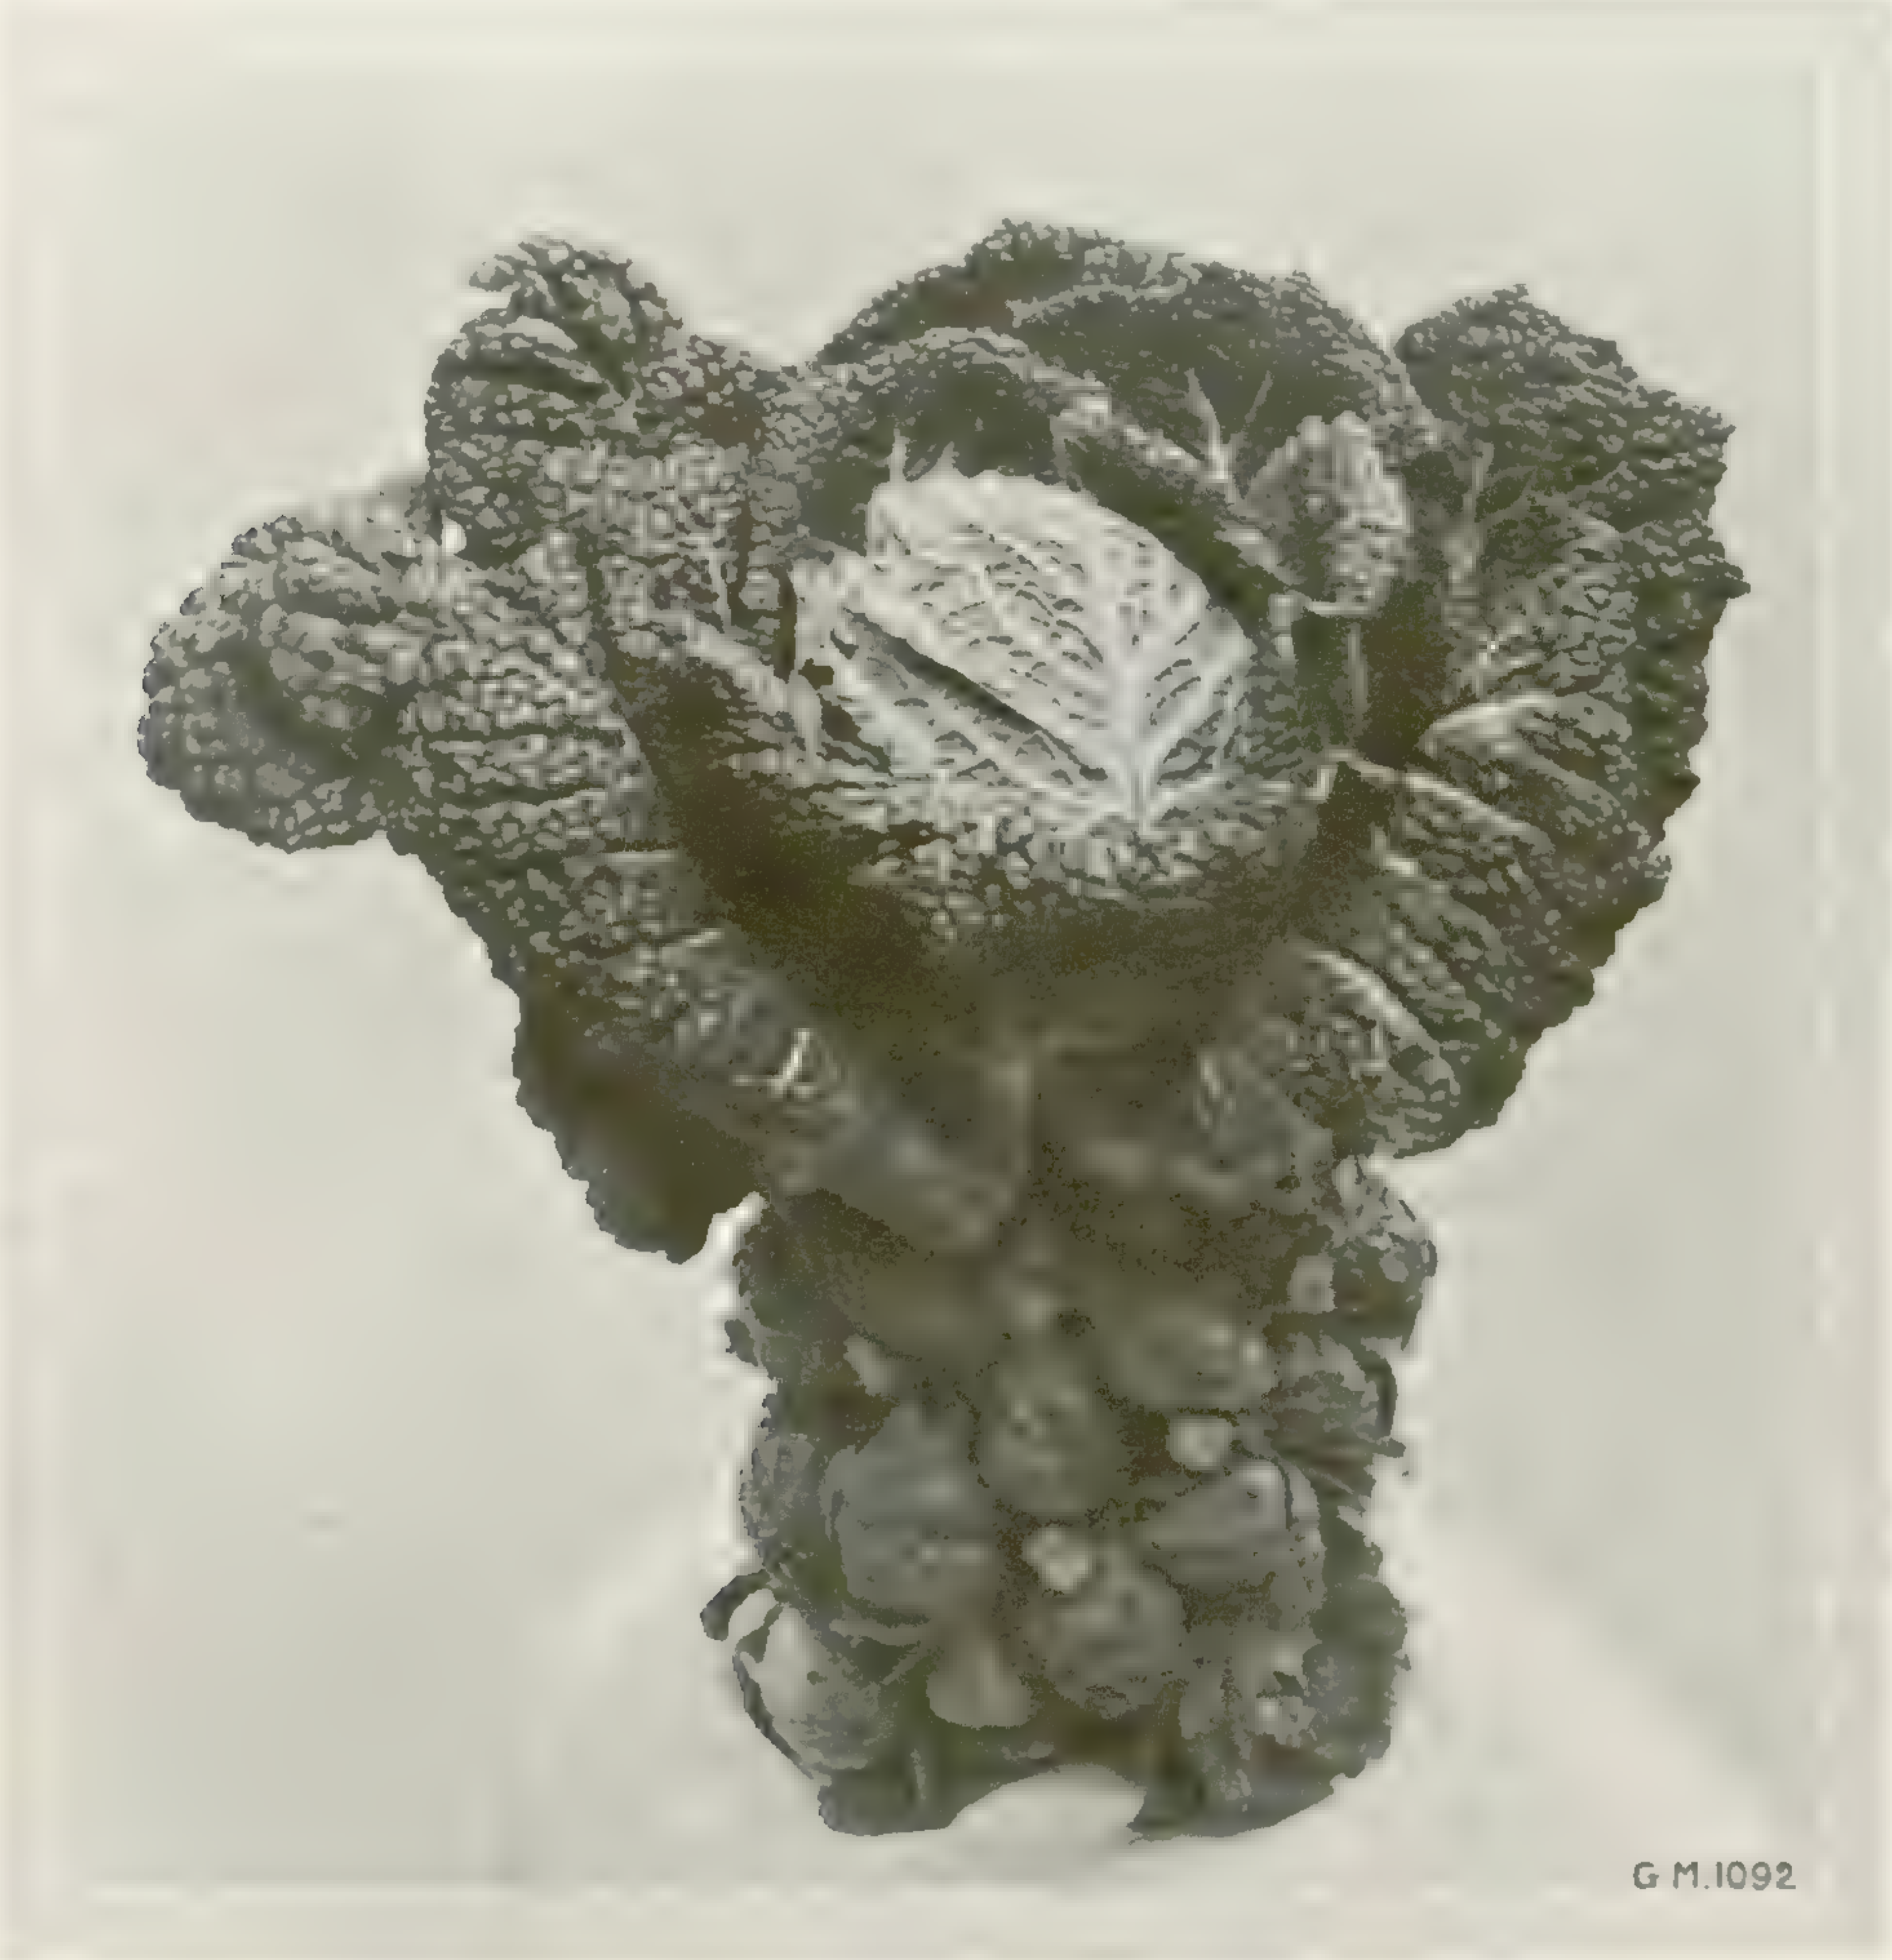
Seed is best sown in boxes during the month of January or early in February. The boxes need not contain more than three inches of soil. In a temperature of from 60 to 65 degrees germination soon takes place, provided a good watering has been given, which should not be repeated oftener than is necessary, once or twice proving ample.

I once had a failure with seedlings through an excessive quantity of soot getting into the soil by accident, which had the effect of severely checking their growth. When the seedlings are large enough to handle, they should be transplanted into boxes; for preference these boxes should be two feet long, one foot wide, and five to six inches deep.

In preparing the boxes for the reception of the plants first place a layer of rotten manure at the bottom, then fill up with fairly rich soil, for example, old chrysanthemum soil that has been well aerated and sweetened, and which has previously received an abundance of liquid manure. After making the soil comparatively firm commence to prick out the plants three inches apart and place them near the glass, meanwhile keeping the house or frame closed for several days in order to stimulate root action. When this is established air must be admitted freely night and day except during severe frosts. If seedlings are allowed to get drawn up and thereby weakened, they never do so well as strong, robust plants which have been well hardened off.

Selection and Treatment of Soil.

Needless to say, all growers of exhibition onions must trench their soil early in the season, particularly when it is of a stiff, retentive character. There is no better aspect than one facing south or south-west. Take out a trench two spits wide and two spits deep, wheeling this soil to the other



NEW SAVOY SPROUT.
Exhibited by Messrs. Sutton and Sons.

end of the ground where the bed is to finish —unless it is preferred to divide the ground down the centre and make trenches shorter in length to avoid much wheeling. Dig up the third spit, allowing it to remain at the bottom of the trench, and spread over it a good layer of well-rotted manure, that produced from fattening or cake-fed animals for preference. The first spit of the next trench should be put on this, and on the top of this another layer of manure, which cover in turn with the second spit, the third spit being dug up and left in the bottom as in the first trench. The rougher the surface on the top of the ground is left after trenching the better, as then the frost will penetrate the soil more readily, and with better results than when the soil is left smooth on the surface.

What is of equal importance is that with heavy soils this treatment will prevent the particles from running together so easily when subjected to heavy rains. As the month of March approaches, or in February if the weather is open and dry, the ground should have a liberal dusting of soot, lime, and wood ashes forked over the surface. Towards the end of March or April a similar dressing should be given again, but this time supplemented with a sprinkling of dry poultry manure or guano. The lime will make the soil sweeter, and it will also work better, as also will the wood ashes in addition to supplying potash in a very available form, especially beneficial to soils light in texture. This dressing, as well as the previous one, need not exceed one ounce of each to the square yard. The soil must now be forked over to the depth of a digging fork if its freeness and porosity admits of this being done.

Planting.

In the South of England, planting out is usually commenced about the middle of April, selecting if possible a dull, showery day, but not sufficiently wet to cause the ground to be injured by treading upon it. Windy days should be avoided as the young roots are very sensitive, and if dried either by wind or sun the seedlings receive a severe check, more so than they do by frost arresting their growth after being planted out. Never plant inferior looking plants, but only those of sturdy habit. Plant with a trowel and take all possible care of the roots, removing them from the box with a ball of earth attached. The plants must be given ample room both between the rows and from plant to plant; in the former case allow at least 18 inches, and not less than 15 inches from plant to plant. Firm planting is essential, and as the work proceeds, give a liberal watering through a fine rose. If the weather should continue dry, this watering may be continued merely until the plants cease to show signs of "flagging."

Old Basing. J. C. NEWSHAM.

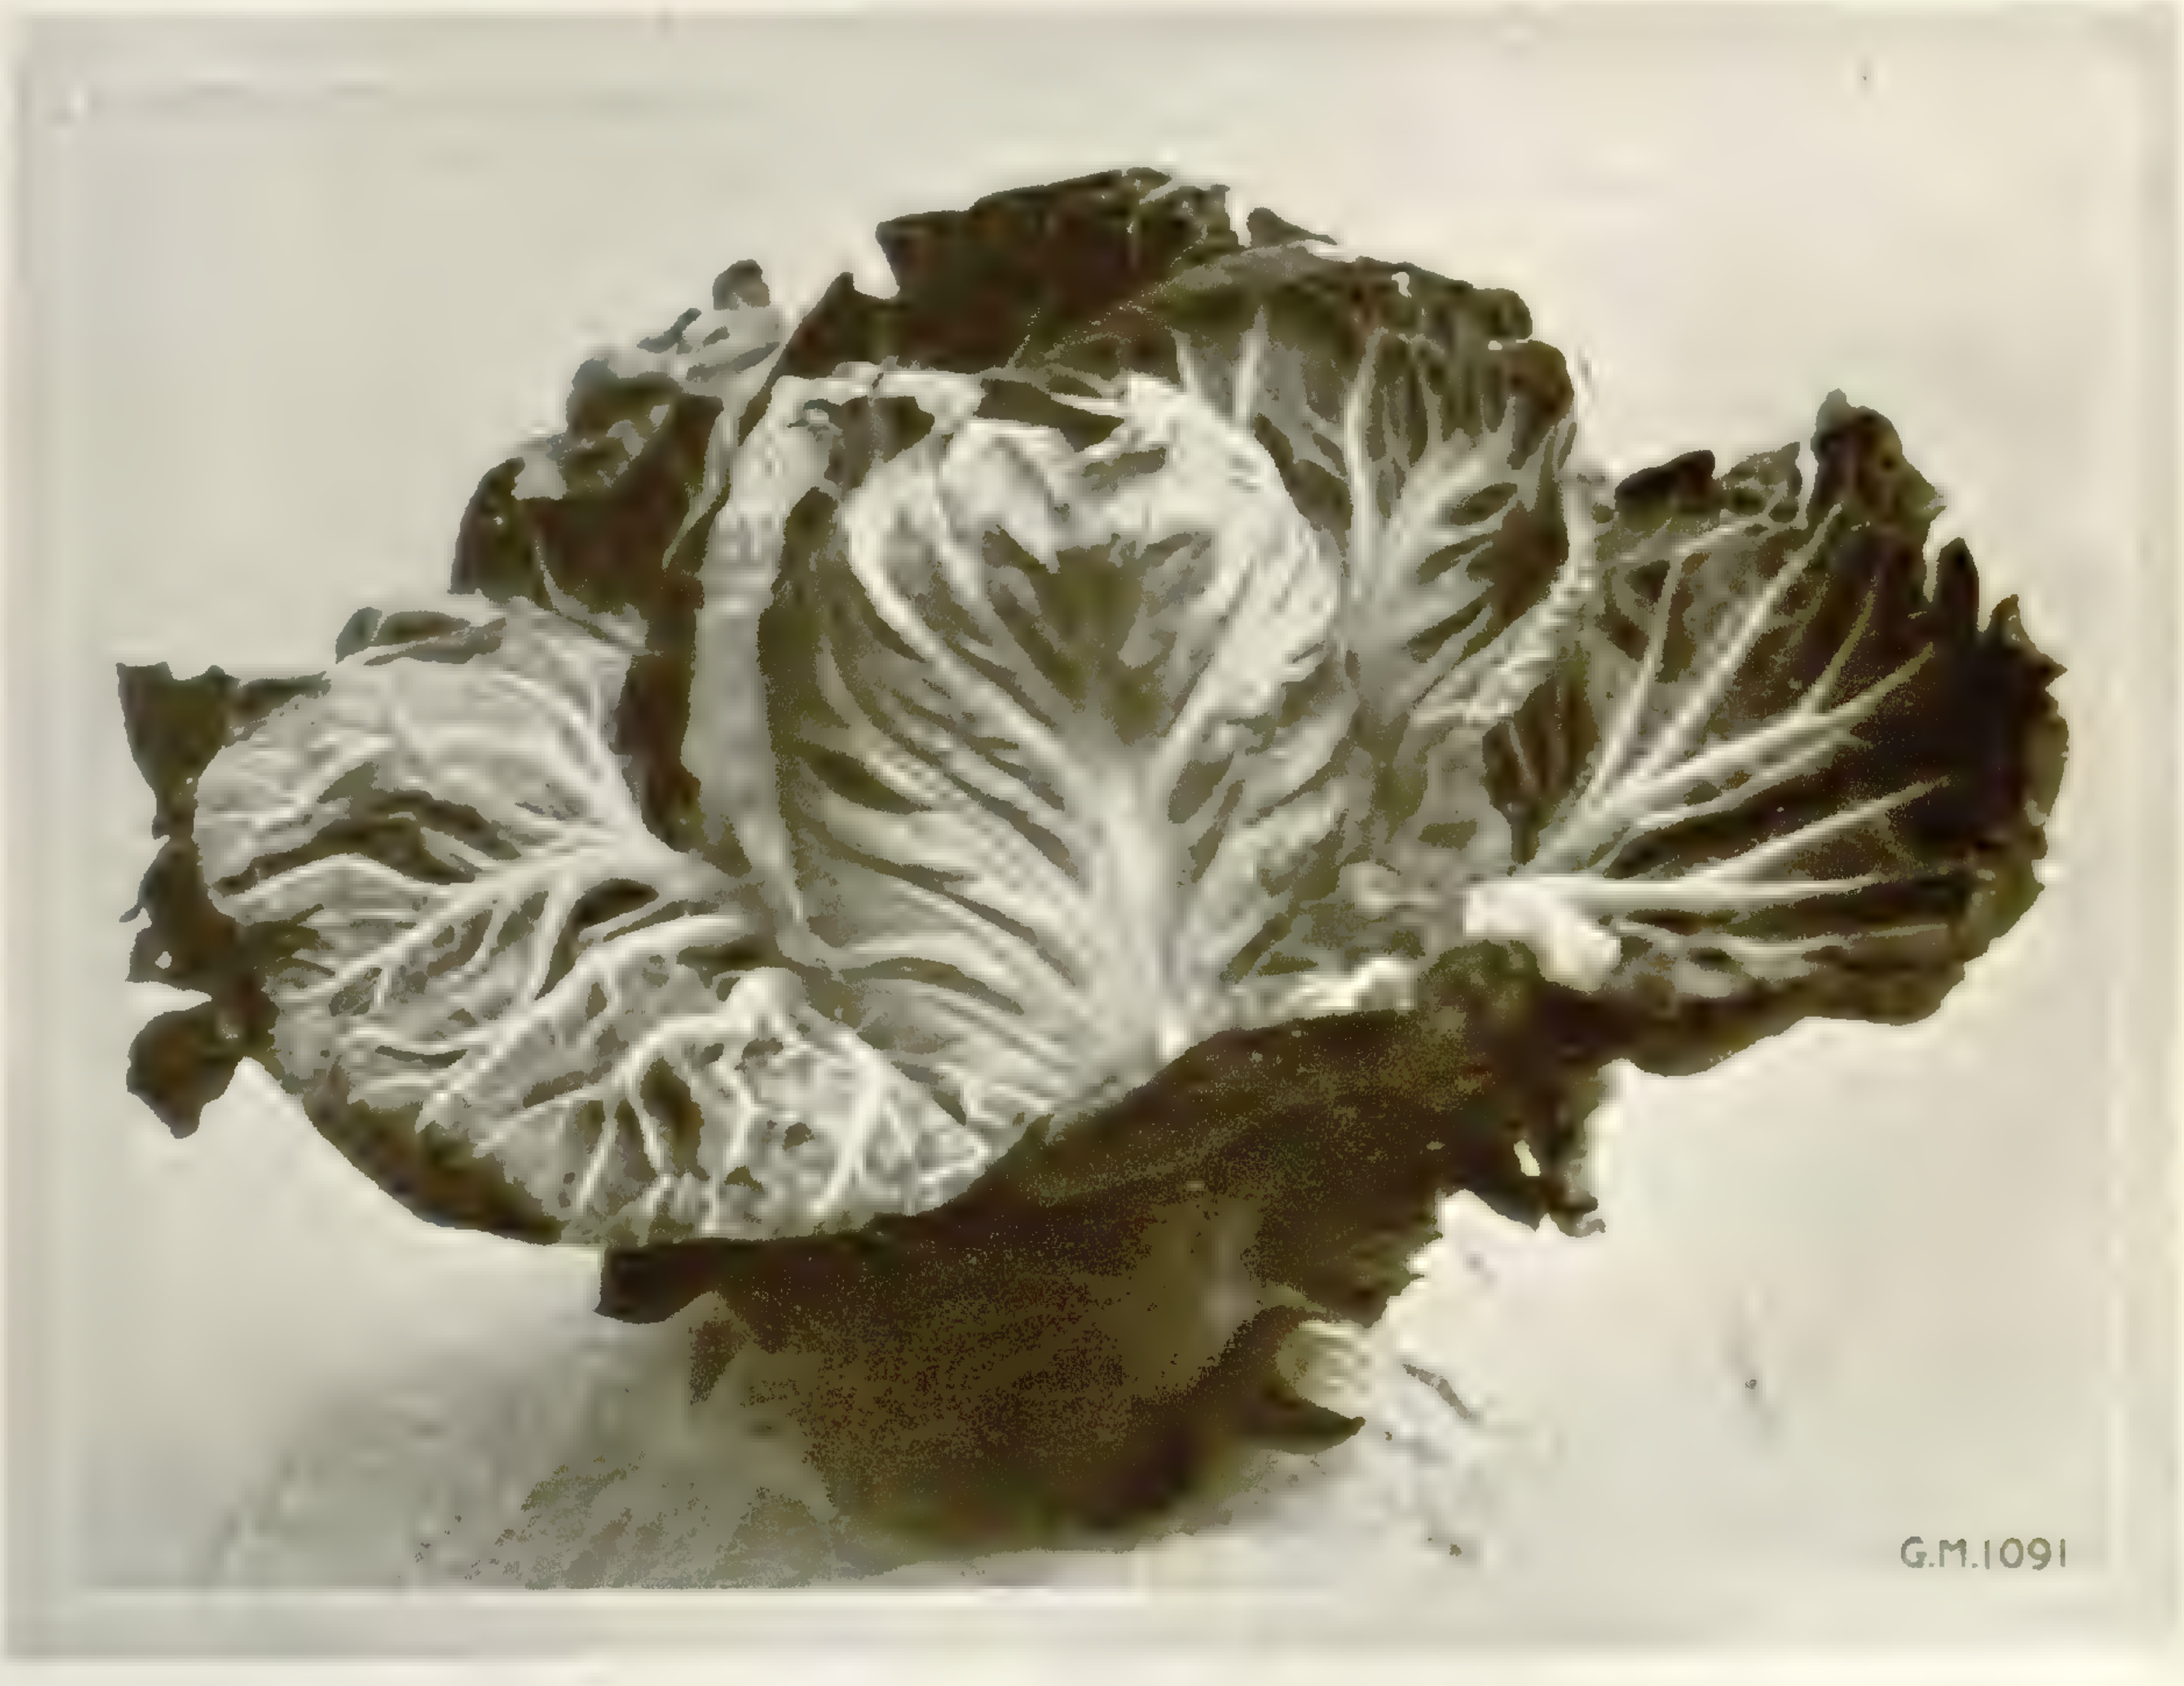
(To be continued.)

NEW BRASSICAS.

To the first of the two meetings held by the Royal Horticultural Society in September last, Messrs. Sutton and Sons, of Reading, contributed a collection of brassicas, which, as stated in our report, was remarkable for its comprehensive character, and for the inclusion of several quite new types. It was of much interest to see at a public exhibition fully-developed plants that had been grown from seed collected from specimens of the wild cabbage growing in its native rocks on the English coast, and still more interesting was it to have an opportunity of seeing the latest results in cross-breeding in the great family of brassicas. The new types were three in number, and of these we were specially attracted by the Savoy Sprout, because it has the promise of proving a useful addition to the list of green vegetables available during the winter. This has a stem of moderate height bearing throughout its whole length compact sprouts, and surmounted by a medium-sized savoy. The sprouts, like the head, have the distinctive characteristics of the savoy, and will, unless we are much mistaken, be much appreciated by those who like the flavour of small green savoys, but have an objection to the large, compact heads so much in vogue. The general character of this new vegetable is well shown in the illustration of one of the specimens exhibited on the occasion referred to.

Next in importance is the Hearting form of Couve Tronchuda, or Portugal cabbage. The typical form is of strong growth, with wide-spreading leaves, and is grown for the leaf-stalks, which, when nicely cooked, make a most acceptable dish. In the new type the growth has been so compressed that the leaf-stalks have all but disappeared, and the leaves form a compact heart that closely resembles one of the high-class, medium-sized cabbages with conical heads. The appearance of the hearts of the new cabbage suggest that they will be tender and delicate in flavour. Of this also we give an illustration.

The third of the new types is a Brussels sprout with a cabbage head. G. G.



A NEW HEARTING FORM OF COUVE TRONCHUDA.
Exhibited by Messrs. Sutton and Sons.

NOTES FROM KEW.

Erlangea tomentosa is a comparatively new composite from Central Africa, and though it can scarcely be called showy, is remarkably free flowering, and has the advantage of being at its best in the depth of winter. In general appearance it suggests an affinity with the ageratums and eupatoriums, forming like most of them a free growing, freely branched plant of a half-shrubby character. The broadly lanceolate leaves of this erlangea, which are clearly serrated, are, as well as the young shoots, clothed with a whitish tomentum, thus giving to a specimen a distinctly hoary appearance. The flower heads, which are borne in terminal corymbs, are individually small but very numerous. The colour is pale lilac with a lighter centre. A group of plants about a yard high and in full flower, is very noticeable in the greenhouse No. 4. Though as above stated this erlangea is not showy, yet it is, I think, destined to become popular. Its ready propagation and easy culture are great points in its favour.

Buddleia asiatica is in no way a novelty, for it was introduced in 1874, but after that it seems to have been lost. It was reintroduced by Mr. Wilson when travelling for the Messrs. Veitch in 1902, and rapidly became popular, being given a First Class Certificate by the Royal Horticultural Society on January 23, 1906. Though at that time comparatively unknown in this country it would appear to have been extensively grown on the Riviera, and according to Mr. Wilson himself it was a popular plant in the gardens of the Far East when he sent it home. The same writer states that it is found throughout Eastern Asia and Java, while in China it is fairly common in the Yangtsze Valley, Yunnan, and South China generally. In a state of nature it occurs as a large shrub, but under cultivation good flowering examples may be grown in pots from six to nine inches in diameter. In this way it forms a loose bushy specimen, nearly every shoot of which is terminated by a long narrow raceme of white fragrant flowers. Its beauty in this state is well shown in the greenhouse, where for the last couple of months or so it has gained many admirers. Like most members of the genus it strikes root readily from cuttings, and grows freely.

With the exception of the old Crassula (or Kalosanthes) coccinea, very few members of the genus are regarded as flowering plants. But C. lactea, an old species, for it was introduced in 1774, is, in the shape of dwarf bushy plants, employed as an edging to a group of taller subjects, and very pretty it is in this way. The stems, though less than a foot in height are very stout, and clothed with ovate leaves of a thick succulent character. The flowers, borne in flattened panicles, are individually starlike in shape and of a pure white colour. Being a native of South Africa it only requires greenhouse treatment, and as a winter-flowering subject it is certainly well worthy of note.

The Correas, known popularly as Australian fuchsias, were favourite subjects for specimens in the days when hardwooded plants were cultivated far more extensively than they are now. The flowers of the whole of them are of an inflated tubular shape, and the segments recurving at the tips. They are disposed in a drooping manner, and are altogether suggestive of a fuchsia, hence the popular name. One of the brightest of all is C. cardinalis, whose flowers are scarlet, tipped with green. The "Dictionary of Gardening" gives March as its season of blooming, but it is just now very effective in No. 4 greenhouse.

Senecio canalipes, the climbing member of the groundsel family, has been several times referred to in the Gardeners' Magazine. It is flowering freely in the succulent house, at Kew, a condition in which it has been for a long time, the dry atmosphere and genial temperature apparently meeting its requirements. It is a desirable rafter plant for a good-sized structure, being a vigorous grower with heart-shaped leaves, partially lobed and thick in texture. The flowers, which are borne in large, branching, loosely disposed clusters, are a little over half an inch in diameter, and of a rich yellow colour. A succession of them is kept up from autumn to spring. In the same structure, and also in flower, is a specimen of the Cape Ivy (Senecio macroglossus) which is a much better-known plant than the preceding. The flowers are a great deal larger and of a paler yellow, but at no time is there the wealth of blossom that one finds in Senecio canalipes.

In that portion of the T range where an intermediate temperature is maintained some of the aphelandras are conspicuous by reason of their bright coloured blossoms. Notable among them are A. aurantiaca, with prettily marbled leaves and spikes of orange scarlet flowers; A. Fascinator, whose leaves, dark green above and purplish beneath, have the midrib and principal veins marked out with silvery white, the flowers being scarlet; and A. nitens, with bronzy green leaves and scarlet flowers. All are easily grown, and from the brightness of their flowers they make a goodly show at this season.

Ipomæa Horsfalliæ Briggsi is flowering freely in the Victoria Regia house, and so beautiful is it that one wonders why it is not more often met with, as flowers in the depth of winter are none too numerous. Though the typical I. Horsfalliæ is listed in most nurserymen's catalogues, I have searched in vain for the variety Briggsi. This is certainly surprising, for it is, at least in my opinion, superior to the type, from which it differs in its smaller and deeper coloured flowers, and the greater profusion in which these are borne. Added to this I. Horsfalliæ often flowers in autumn, whereas Briggsi is, as a rule, at its best in December. It must be nearly twenty-five years since I first met with this variety at Kew, and it has been a delightful feature every winter since.

Some bushes of the choicest hybrids of the Javanese section of rhododendrons which were a few years ago planted out in the Mexican or warmest end of the temperate house are now in flower, and very bright and effective they are. As seen during the dull half-light of a mid-winter day those with blossoms of an orange or orange-scarlet tint stood out by far the most conspicuously. For some reason or other, probably owing to the fact that their blossoms are not suitable for cutting, these rhododendrons do not receive their due share of attention. K.

Apple Barnack Beauty.—This is one of the best late-keeping apples that I know of. It is a useful variety for March, April, and May, being at that time firm of flesh, high coloured, and of good flavour, better than many dessert varieties then in season. The fruits are medium sized, suffused with yellow and red in the autumn; as the spring time comes richer streaks of red appear which give to the specimens a very attractive appearance indeed. I have found this variety a really good one grown as a standard, and very prolific, but it is best grown as a pyramid or bush.—G. B.

FORCING OUTDOOR RHUBARB.

The season for rhubarb having commenced, various devices find their several advocates actively engaged in procuring the means whereby a succession of this much-sought edible is obtained. The familiar cone-shaped pot or flour barrel find a ready purpose at this time of year, and the time-honoured manure bed, which is all the more lasting and steady when tree leaves form a component part, may be seen in most gardens. Rhubarb is very adaptable to this form of culture when the earlier sorts are chosen. Late varieties, like Victoria, do not readily respond to warmth before the new year is advancing, and for the earlier supplies most gardeners avoid this kind, excellent though it is for later service. Forced in this way, there is a taint of manure imparted unless care is exercised in providing means of escape of steam through a tilted cover, and when strongly flavoured by contact with manure the sensitive palate rebels. Grown in pipe-heated mushroom houses there is a much more natural flavour in forced rhubarb, and it is consequently less offending to the critical palate.

The common course of procedure is to heap the fermenting manure round the pots first to about one-half their height, adding further layers as this becomes necessary; but though seldom practised, the most economical and most effective system that has come under our notice is to plant the roots in special beds raised slightly above the ground surface, and having wide alleys between. These are dug out sufficiently deep to allow of manure and leaf beds being made to a depth of eighteen inches to two feet, slightly covering the adjacent soil around the pots. The heat generated acts directly on the roots to their whole depth, which naturally brings about a much quicker response than that following the more common practice of heaping on the open surface about the pots. These beds have two rows of plants in them, their width about three feet, and trenches between them two feet wide. It must be said that duplicate beds are necessary, so that they do duty every alternate year, a practice that is followed in the case of ordinary cultivation. It might be suggested that in adopting this particular course for the purpose of early outdoor forcing short beds, say, twelve feet in length, that would accommodate a dozen plants, would be more convenient for the private garden. If this could be formed on the frame ground it would be more readily accessible both for application and removal when the heat is exhausted. It would be advantageous to allow the manure to remain in the trench during the summer, as this would obviously lessen the need for applied moisture to sustain them in their growing period. The removal of this manure to the whole depth of the trenches would expose the whole surface of the bed to the action of frost, air, and sunshine, all tending in turn to assist maturity of crown, conditions so essential to economic forcing in early winter.

Specially made beds reserved for the earliest supplies will, by the rotative course of forcing, submit more readily in course of time, and supply daily gatherings as early as the season demands, which is about the period of Christmas. Those readers who may not have adopted this course, and have pressing demands made upon rhubarb supplies, may find it advantageous to prepare such beds during the present winter as a possible provision for future requirements. To support the sides and keep the soil from crumbling down by the action of the weather, it will be obviously necessary to fix light boards and stakes, unless the trenches are opened at a future period, when the soil has had time to settle perfectly. This might appear the more adaptive, because unless good strong crowns are set apart for this intensive system, two years must elapse before forcing is attempted, and by that time the ground would be firm, and the sides rigid.

It may be said in passing that since the cost of horticultural buildings and heating has been so reduced and popularised the need for outdoor primitive methods of forcing has not been so great as was the case in bygone years, at the same time it still has a limited application.

W. Strugnell.

STOCKS FOR ROSES.

When we consider the great variation of soil often found in a very small area, the necessity of using foster roots that naturally prefer a certain class of soil is evident. The question of suitable stocks is a wide one, for we can make no hard and fast rule even for a given class or section of roses; while in not a few instances it is even better to use no stock at all. So many opinions are given upon this matter that I do not expect to escape criticism, and merely give a few of my own experiences and observations.

We use the brier in three forms, seedling, dwarf cutting, and as standards of more or less height, from the hedgerow. Then there are the manetti, De la Grifferaie, polyantha, and sometimes a few of the stronger-growing varieties. Some of the easiest to grow are Dorothy Perkins, and others of like habit from the Wichuraianas. These root very freely, and most varieties grow well upon them. Unfortunately the persistent and natural tendency to produce root suckers is very troublesome when making use of these as stocks, but with this exception I like it better than De la Grifferaie or Rosa polyantha simplex. It is certainly a good foster stock for the stronger growing teas and hybrid teas when upon a rather light soil, which does not suit the brier so well as that of a cooler and closer nature. But the suckers must be kept down, and these push from the roots like those of the blackberry and raspberry. Stocks of these roses are very soft in the bark, and swell more evenly with the growing bud of a strong variety than in the case of briers. But it is fatal to a weak grower for the same reason, as it soon overgrows, and practically swamps it with its excessive supply of sap, much more than any but a strong grower can accommodate. Another point in its favour is its doing so much better upon a dry and naturally sandy soil than is the case with brier, and yet does not provide the same rankness of sap—if I may use such a term—as the manetti: I also find it quite as early to push into growth. In fact, if it were not for its tendency to form suckers rather freely away from the base of the plant I should esteem it much more.

Referring to the manetti, it must be said that this stock is not nearly so much used now, not even for the hybrid perpetuals and Bourbons, two classes that, a few decades back, were seldom grown in any other form than as dwarfs. It is better than the brier in a few instances, such as very light soils, that we seldom find the brier thriving upon in a wild state. Like the stocks previously mentioned, the manetti is not very suitable for weak growers, and yet we find a few notoriously indifferent habited varieties do well upon it in the maiden stage, and perhaps most of the best flowers of Horace Vernet, Marie Verdier, Louis Van Houtte, A. K. Williams, and Monsieur Noman, among others, are obtained the first season from budded manetti. As a rule, however, these deteriorate rapidly, and seldom live more than three or four years.

There is little choice between the cutting or seedling brier stocks. The first certainly throws a better maiden plant, and frequently gives some grand first flowers, but it soon reverts to its natural habit of deep rooting. Both are the best all-round stocks we have. A much deeper shade of colour is obtained, particularly among the crimsons and maroons, while the season of flowering is certainly lengthened, and I find plants upon brier longer lived; nor are they so subject to red rust as when upon the manetti, although the same variety is growing side by side upon the two stocks.

If the manetti is not so useful for teas and hybrids in the open, plants often do well when grafted, or even budded, in the open and lifted for pot culture, probably because the roots are unable to wander and get into so strong a condition.

A stock that pleases me very much where a few really good flowers are wanted, in preference to greater numbers, is the short hedge brier. When these break from eighteen to twenty-four inches from the ground we can grow varieties with a drooping tendency better than when upon the usual dwarfs. The very fact of these flowers being so full and heavy causes them to hang down, and often be splashed in some form. Most of these roses, too, are produced upon much more slender growths than the trusses of smaller and lighter varieties. I am alluding to such as Dean Hole, Catherine Mermet, Bridesmaid, Medea, Mrs. Edward Mawley, Maman Cochet, and its white sport. Abnormally short-habited kinds, like Lady Mary Fitzwilliam, Lady Alice, and others, are also helped by the short brier stems, and I have generally succeeded in obtaining better individual blossoms of most trees when grown in this form.

Just a word about soils. We have grown roses upon stiff clay, and upon a clayey soil that pulverised almost to dust when exposed to the air. Here we find brier the best. By the way, such soil as I have just described is excellent to intermix with light sandy loams, and does more good than so much manure without this stay. Black, sandy, and peaty loam suited the manetti better than the brier, but the stock grew too rank for many varieties. A rich, stiff, and fairly deep loam is the most suitable. But we can make up our soils with a very little trouble, far less in fact than when growing lilies, rhododendrons, azaleas, etc., upon soils not naturally suited to them. Much depends upon manures supplied. Use a stiffer and moister natured manure upon light soils than upon those already on the close or stiff side.

These notes will, I hope, help the amateur who intends planting out stocks this season for budding upon next summer. We do not plant out our dwarf stocks until early in the spring, so that there is ample time yet, but it is undoubtedly better to have all hedgerow briers planted by November; October is my favourite month for these.

A. Piper.

Uckfield.

There is no better guide to the kitchen garden than Vegetables and their Cultivation, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables, saladings, and herbs for home use. Price 5s. net, by post, in box 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SUCCESSION OF FLOWERS.—There is a material difference between a purely orchid collection and an ordinary private collection which is limited in the numbers of plants grown, and also the accommodation provided for their cultivation. It very frequently occurs that in these limited establishments the plants are expected to be in bloom at a particular season of the year, or a prolonged season of successive flowering plants is desired. It is not so difficult to provide orchid flowers at a stated season, because only those plants need be grown which bloom at the desired periods. In the case of limited accommodation, and a desire to have plants in bloom during the whole or the greater portion of the year's cycle, certain numbers must be grown under conditions that are not altogether suitable to their requirements. Also accelerating or retarding the flowering in some cases must be done. To carry out the details successfully considerable forethought is necessary on the part of those in charge, and the grower must have more than an ordinary interest in his work. In years such as 1909, when so many plants fail to properly mature and ripen their growth, the difficulty is very great in maintaining a continuous succession of flowers. I frequently feel that those of us who are working under more favourable conditions fail to appreciate the difficulties that have to be surmounted, and it is seldom that contributors to the gardening Press give much help to those working under limited conditions. True, the difficulties have been very greatly minimised since the raising of orchid seedlings became so generally practised.

SELECTIONS.—There is little difficulty in making selections, that, under favourable conditions, should supply the requirements in this direction, but to do this satisfactorily I consider that cool, intermediate, and stove temperatures are necessary. I am quite prepared to admit that where sufficient numbers of odontoglossums and other cool house orchids are grown we have the material that rarely leaves a break in flower production throughout the year, but this is in part owing to the durability of the flowers. In the intermediate house, where the temperature is retained at from 55 to 60 degrees in winter, the whole section of winter-flowering and other cypripediums can be accommodated, as also many other kinds of orchids suitable for successive flowering. Here also the stove or warm house kinds may be rested, or placed when in bloom to prolong the flowering. This house is indispensable. In the stove we may grow such kinds as the dendrobiums, phalænopsis, vandas, ærides, calanthes, phaius, and those of the South American kinds, such as the cattleyas, the warm-growing oncidiums, and others that require a brisk temperature and a humid atmosphere in which to make their growths. There are a number of gardens in this district where no houses are specially set apart for orchid cultivation, yet many of these have a goodly number of orchids, and the success achieved is so great that in many cases frequent additions are made. I have no doubt that in due course some of the owners who are so much interested will become prominent orchid collectors.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

HOUSE CLEANING.—As the opportunity occurs the stoves should have their annual cleansing, and in none of the plant houses is this more necessary than in the stove. Therefore when commenced no detail should be overlooked that would tend to make this operation most thorough, for if troubled with any pests, such as thrips, red spider, mealy bug, or ants, the present time is the best in which to master them; and if it is not done properly now it may mean many days' additional work during the season, and probably just when time is precious. When possible all the plants should be removed from the house, as this will greatly facilitate the work. After this has been done all climbers, such as stephanotis, allamandas, etc., that may be planted out should be carefully pruned. Retain only the wood necessary to furnish a supply of young growths for the coming season, the remaining growth should then be sponged, dipped, or syringed with some insecticide: if these are planted out in borders or brick pits it is wise to cover them over during the process of washing down, as if they receive a thorough soaking of water they are rather apt to start into growth before they are wanted. After the house or houses have been thoroughly scrubbed with soap and water, and had a good washing down with the hose, I like to give the whole house, woodwork, glass, stages, in fact everything, a good spraying with a mixture of clear water and paraffin, fairly strong, and this will kill nearly everything in the way of pests that may be about. Before returning the plants to their quarters again, all ashes, shingle, or shell should be taken from the stages and thoroughly washed, or replaced by fresh, whichever may be deemed necessary, but this will only be required every second or third year. All walls should be whitewashed, using a little sulphur and paraffin mixed with the lime, and if this is slaked down immediately before using it will be found to dry white and hard, and not come off on to one's clothes. Also the pipes should receive a coating of lamp black and oil (boiled). This will make the houses look clean and neat, and if the blacking is done one day and the pipes briskly heated at night, they will be quite dry next morning, and nearly all the smell will be gone. The plants, where necessary, should be carefully sponged and syringed before they are returned to their places, and any that have become leggy or otherwise unsatisfactory should be pitched away, providing, of course, there is sufficient young stock to take their places.

ADIANTUMS.—In many stoves adiantums are often grown in quantity, and where this is the case these, when returning the other plants after washing down, may be left in an intermediate house for a time and kept fairly dry. This will tend to rest them, and growth will be stronger when they are repotted and returned to their warmer quarters.

CROTONS AND DRACÆNAS.—These, where they have become leggy and are wanted for young stock, should be ringed at once, as by so doing fairly large plants may be taken off quite early before the sun will have gained much power. Otherwise they are very apt to flag, and many of the bottom leaves are lost. After ringing or tonguing all the plants so treated should be kept as close together as possible, so that they may receive frequent sprayings overhead to keep the moss in a moist condition, under which treatment they will make root quickly. I do not advocate this method of propagation, as I always find cuttings put in during the autumn or early in the spring make much lighter and more graceful plants.—Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

EARLY PEACHES.—Houses in which peach trees, either planted out or in pots, are swelling their buds, should have a night temperature of 50 degrees, with a rise by day from fire heat of 5 degrees, and an increase of 10 degrees from sun heat, accompanied with a little top ventilation. A fairly moist atmosphere should be maintained, and in the mornings of fine days the trees be syringed with tepid water, but avoid keeping the buds constantly wet. As a preventive of greenfly, vaporise the house immediately before the blossoms open. During the blossoming period raise the temperature 5 degrees, discontinue the use of the syringe, promote a gentle movement of the air by opening more or less, as external conditions dictate, both the front and back ventilators, and assist the fertilisation of the blossoms by distributing the pollen at midday by the aid of a camel-hair brush or rabbit's tail. As soon as the fruits set resume syringing, and when the shoots are about one inch in length commence disbudding by rubbing out the most forward of misplaced shoots. This operation should be gradually done at intervals of a few days.

SUCCESSIONAL AND LATE PEACH HOUSES.—A house having been prepared should be closed in time to keep up the supply of fruit, and if not already done, late houses should be made ready for closing as required. After cleansing the house, well wash the old wood and the fruit-bearing shoots with a solution of some approved insecticide. Be careful to dislodge scale, and to avoid injury to the buds of the trees. In training, if there is more young wood than is required to clothe the trees at five inches apart, thin out that which is gross or weakly, always bearing in mind that crowded wood does not produce good fruit or good wood for future crops. Remove the surface soil of the border, replace it with fresh compost, and top-dress with short stable litter that is free of woodlice. Should the borders require water, moisten them thoroughly.

STRAWBERRIES. — Patience must be exercised in forcing this fruit, especially during the early stages of its growth, for until the flowers expand the night temperature should not exceed 50 degrees, and that by day from fire heat 55 degrees. As soon as the blossoms open a rise of 5 degrees should be allowed, a circulation of air—avoiding cold draughts—maintained, and artificial heat, as advised for peaches, be given to ensure perfect fertilisation. Thin the fruit once it can be observed that enough are set for the crop, bearing in mind in doing so that over-burdened plants cannot yield large fruits, and expose it to the sun by supports. Closely attend to the removal of runners, and watering, at no time permitting them to suffer from drought. As nourishment, give occasional light dressings of suitable artificial compounds, or regular supplies of diluted farmyard liquid, from the time leaf growth commences until the fruit begins to colour, while the plants in fine weather should be daily syringed, except in their blossoming and fruit ripening periods. Batches of plants to meet demands should be introduced into warm quarters at suitable intervals of time, and in all cases keep the plants well up to the glass upon shelves placed in sunny positions.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

CAULIFLOWERS.—If seed of the early varieties, such as First Crop and Early Forcing, was not sown last month, let it be done at once in boxes filled with sandy soil that has been sifted, and place in a temperature of about 50 deg. Put the seedlings into 2½in. pots when ready. Others could be boxed off, and eventually planted in frames where a gentle heat can be maintained till the heads are fit for cutting. These will be found to fill a great gap, should inclement weather occur to retard late broccoli. Raise in the same manner Magnum Bonum, Defiance, and White Queen for succession.

CUCUMBERS.—Seeds of cucumbers should be sown singly in thumb-pots filled with a light compost and plunged in a hotbed. If this is not available, plunge the pots in an evaporating trough filled with cocoanut fibre refuse or coarse leaf-soil. Be very careful with the water, a moist atmosphere almost sufficing till germination takes place. Put the seedlings in 3½in. pots, and replunge till ready for their final planting on hotbed mounds.

PEAS.—A few boxes should now be sown with seed of an approved variety, to finally plant into a frame where they will produce their crops. Sow broad beans likewise.

FRENCH BEANS.—To maintain a constant supply a fortnightly sowing should be made. At this dull season of the year the best results are obtained by sowing six seeds in 4in. pots. When ready, shift into 7in. or 8in. pots, using for this purpose a compost consisting of equal parts loam, coarse leaf-soil, and spent mushroom-bed, warming the whole thoroughly before using. Keep a warm, moist atmosphere where growing freely, and top-dress weekly. For first crop sow Sutton's Forcing and Ne Plus Ultra, and for later crops Canadian Wonder.

LEEKS.—If specimens are required for early supplies the seed should be sown about the 21st of the present month. In this case sow in 6in. pots, and when the seedlings are ready for pricking off place them in a similar temperature to that advised for onions, and give them a position near the glass.

TOMATOES.—A sowing of seed should now be made of tomatoes. Sow in 6in. pots at this season of the year, and use a compost consisting chiefly of leaf-soil, with a little loam and coarse sand added. Warm the soil previous to sowing, and place the seed pots on a shelf in a warm house quite near the glass. When the seedlings are showing the first true leaf pot off singly, using thumb-pots and more loam to the compost, but keep them in the same temperature. Excess of moisture must be avoided both at the roots and overhead.

POTATOES.—If the sets have been encouraged to form healthy sprouts, lose no time in endeavouring to procure at an early date small dishes, by planting three sets in each 10in. pot, using a friable compost. Always leave enough room for further top-dressings. Place in warm temperature, but aim at a steady growth. Sutton's May Queen and Webb's Express are splendid varieties for this mode of culture.

MUSHROOMS.—Where a good supply of fresh horse manure is obtainable beds should be made at frequent intervals to maintain a regular supply. If the manure is not forthcoming in good quantities small beds should be made more frequent still, as, if the material is not gathered almost at one and the same time for preparation, much of the value of the droppings will be lost.—George Ellwood, Swanmore Park Gardens.

DOUBLE ARABIS.

This useful spring plant (Arabis albida fl. pl., syn. Corbeille d'Argent) has obtained a great vogue during the last few years, and is now regarded as quite indispensable for spring bedding. Whether it is a newly-raised plant or not is perhaps not certainly known, but it is only very recently that it has come to be generally grown, being given an Award of Merit by the Royal Horticultural Society in 1900. I read in a six-year-old catalogue that "this new double form is undoubtedly destined to become one of the most popular border plants," which was truer than many of the catalogue prophecies. It forms one of a trio, the other two members of which are aubrietia and Alyssum saxatile, which look extremely well grown together in a bed by themselves. As a surfacing plant for a bed of hyacinths, for those who like such artificial and formal beds, there is nothing better, no matter what their colour may be.

The double arabis comes into flower rather later than the single form, and lasts much longer, practically throughout April and May, and even later, the flowers being useful for cutting. Like the other rock cresses, of which aubrietia is one, it is better grown in sunshine than in shade, and it matters little how dry it is, or whether the soil is heavy or light, though in a damp soil on the level it is apt to die away and become untidy during the winter.

As it does not produce seed it must be propagated by cuttings, which are best taken about flowering time or soon after, and dibbled in a reserve border to be ready for putting into the flowering positions in the autumn. It spreads very fast, and is best replanted every two years. If allowed to encroach on the iris, the latter will die away in a few months. Alger Petts.

GRAND YORKSHIRE GALA AND FLORAL FETE AT YORK.

June 15th, 16th, and 17th, 1910.

PRIZES ... ... £800.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

There was a comparatively small display on Tuesday, January 11, but, as often happens when exhibits are fewer than usual, the interest and quality of the display were high.

FLORAL COMMITTEE.

A beautiful group of plants, finely set up opposite the entrance by Mr. Prime, gardener to the Marquis of Salisbury, Hatfield House, Hatfield, was a great feature of the show. The centre consisted of very fine examples of the brilliant and graceful Euphorbia jacquinæflora, margined with freely-flowered plants of Saintpaulia ionantha, and flanked by groups of the handsome Begonia Gloire de Sceaux, and the useful Gesnera refulgens. Messrs. H. B. May and Sons, Edmonton, brought up a most interesting exhibit of ferns, showing delightful plants of the exquisite filmy ferns Trichomanes scandens, T. radicans, T. alabamense, T. maximus umbrosum, T. auriculatum, Todea superba, T. pellucida, and Hymenophyllum caudiculatum. These proved a great attraction. Various nephrolepis, platyceriums, and other ferns were shown, with a few daphnes and Indian azaleas.

In the large group submitted by Messrs. James Veitch and Sons, Chelsea, the leading features were well-grown flowering plants of perpetual carnations, the fragrant Daphne indica, and freesias, Begonia Patrie, the new Erlangea tomentosa (A.M.), the graceful Moschosma riparium, and the showy blue Tillandsia Lindeni. Some splendid carnation flowers were charmingly set up by Mr. H. Burnett, Guernsey, who had beautiful specimens of Mrs. H. Burnett, Bridesmaid, Rose Dorée, Rose Pink Enchantress, Marmion, Alvina, and Britannia, as well as numerous yellow and other seedlings.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, contributed a wide selection of cyclamens, of various forms and colours, a group of Daphne indica, and a goodly collection of popular varieties of carnations. The graceful and elegant Primula malacoides, freely flowered, was shown by Messrs. Bees, Lim., Liverpool, who staged several dozen plants. Messrs. H. Cannell and Sons, Swanley, showed some large examples of Begonia Socotrana, and a selection of brilliant zonal pelargoniums. Messrs. Barr and Sons sent up some delightful Christmas roses, lachenalias, hyacinths, heaths, and snowdrops.

Perpetual carnations were again finely shown by Messrs. W. Cutbush and Sons, Highgate, their vases of Mr. T. W. Omwake, Rose Dorée, Mrs. H. Burnett, White Perfection, Countess of Onslow, Afterglow, Aurora, Beacon, and Enchantress coming in for a great deal of admiration. The same firm showed Christmas roses, Schizanthus coccinea, the lovely little Iris histrioides major, daphnes, forsythias, and hamamelis. Begonia Patrie was beautifully shown by Mr. A. Young, Oxted Nursery, Oxted, plants in small 60's, and in 48's and 32's, being all smothered with carmine flowers.

ORCHID COMMITTEE.

Mr. Collier, gardener to Sir Jeremiah Colman, Bart. Gatton Park, Reigate exhibited good spikes of Lælia anceps Sanderiana, L. a. Williamsi, L. a. Hilli, and a big plant of Masdevallia Schroderiana. Messrs. Stanley and Co., Southgate, contributed Odontoglossum Duvivierianum and Cypripedium Gisela von Bulow, the latter a handsome flower with splendid dorsal sepal, and effective markings, derived from C. Euryades and C. Beckmani. Mr. E. Rogerson, West Didsbury, Manchester, brought up some choice cypripediums, such as C. Hindeanum, C. Actæus, C. Leeanum Clinkaberryanum, C. Hiawatha, C. Zeus, and C. Helen II. Mr. G. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney Hill, exhibited Odontoglossum Wiganianum Goodson's var., O. Lambeauianum, O. eximium Goodson's var., O. Rolfeæ, and some fine forms of O. crispum.

Messrs. James Veitch and Sons, Chelsea, submitted a very interesting and attractive group of orchids, consisting chiefly of cypripediums and odontoglossums. Among the former we made special note of C. insigne Sanderæ, C. Actæus, C. Euryades, C. Little Gem, C. Actæus Langleyense, C. Elatior, C. Simoni, and numerous fine C. Leeanum and C. Lathamianum varieties. The odontoglossums were crispum varieties. Mr. Edward V. Low, Vale Bridge, Hayward's Heath, showed Lælio cattleya Charlesworthi, some good forms of Cattleya Trianæ, Cypripedium aureum Surprise, C. Minos Youngi, C. Ville de Paris, C. Olivia, C. Euryades splendens, etc.

In the large display put up by Messrs. Charlesworth and Co., Haywards Heath, calanthes, Lælia anceps, and odontoglossums were the leading features, and there were numerous fine spikes of all of them. The dark varieties of L. anceps were especially good. Odontoglossum Phœbe, O. Ossulstoni, and O. crispum varieties were extremely beautiful. The contribution from Messrs. Stuart Low and Co., Bush Hill Park, Enfield, was made very bright by flowering examples of Lælio-cattleya Charlesworthi, Oncidium varicosum, Epidendrum Cooperianum, Odontoglossum Harryano-crispum, Cypripedium Curtmanni magnificum, C. Leeanum giganteum, C. Orion var. Bella, and the handsome Cattleya Percivaliana splendens.

Messrs. Sander and Sons, St. Albans, submitted the new yellow and white Phaius Cooperi (B.C.). Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking, showed three large spikes of the curious long-tailed Habenaria Ugandæ, and received a cultural commendation for it. Messrs. Cypher and Sons, Cheltenham, brought forward a group of well-grown cypripediums that contained fine flowers of C. Charlesianum Cypher's var., C. Mrs. Mostyn, C. Fascinator, C. Leeanum Clinkaberryanum, C. Mons. de Curte, C. Niobe, etc. Mr. Maurice Mertens brought over a few splendid seedling odontoglossums, and a fine plant of Miltonia Bleueana nobilior. Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, scored with two cypripediums, gaining an A.M. for both C. Bantam and C. Atlas, the latter of large size, and the former finely marked with bright brown. Cypripedium Leeanum His Majesty, from F. Wellesley, Esq., Woking, was a fine flower.

Very beautiful was the white, lemon-lipped Lycaste Skinneri armeniaca (F.C.C.), submitted by Mr. Balmforth, gardener to F. Menteith Ogilvie, Esq., The Shrubbery, Oxford. Messrs. J. and A. McBean, Cooksbridge, showed a few fine cypripediums, and a good example of Odontioda Groganæ. Messrs. Wm. Bull and Sons, Chelsea, showed Cypripedium Hobarti magnificum and Odontoglossum crispum Flora, finely marked.

FRUIT AND VEGETABLE COMMITTEE.

A grand display of apples and pears was made by Messrs. Jas. Veitch and Sons, Chelsea. The fruits were plump and otherwise well preserved, and they were a centre of interest all the day through. The fruits were excellent examples throughout, and represented one hundred and fifty-two varieties. A few of the apples that were specially attractive included Beauty of Stoke, Ribston Pippin, Wadhurst Pippin, Lord Derby, Lady Henniker, Baumann's Red Reinette, Bismarck, Chas. Ross, Newton Wonder, Alfriston, Lane's Prince Albert, Golden Noble, Gascoigne's Seedling, Beauty of Kent, Bramley's Seedling, Tyler's Kernel, Annie Elizabeth, Easter Pippin, and Blenheim Orange. The finest of the pears were Catillac, Bergamotte d'Esperen, Beurre Rance, President Barabé, Marie Benoist, Olivier de Serres, Blickling, and Beurre Alexandre Lucas.

CERTIFICATES AND AWARDS.

First-Class Certificate.—To Lycaste Skinneri armeniaca, from F. Menteith Ogilvie, Esq. (gardener, Mr. Balmforth), The Shrubbery, Oxford.

Award of Merit.—To Erlangea tomentosa, from Messrs. Jas. Veitch and Sons, Chelsea; to Cypripedium Bantam and C. Atlas, both from Lieut.-Colonel Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester.

MEDALS.

Gold.—To Messrs. Jas. Veitch and Sons, Chelsea, for a large collection of apples and pears.

Silver-Gilt Banksian.—To the Marquis of Salisbury (gardener, Mr. H. Prime), Hatfield, for stove flowering plants; to Messrs. H. B. May and Sons, Edmonton, for filmy ferns, etc.

Silver Flora.—To Messrs. W. Cutbush and Son, Highgate, for carnations, etc.; Messrs. Jas. Veitch and Sons, Chelsea, for greenhouse flowering plants, and also one for orchids; Messrs. Charlesworth and Co., Haywards Heath, for orchids; H. S. Goodson, Esq., (gardener, Mr. Day), Putney, for orchids.

Silver Banksian.—Messrs. Stuart Low and Co., Bush Hill Park, Enfield, for carnations, etc., and also one for orchids; Messrs. J. and A. McBean, Cooksbridge, for orchids; Mr. E. V. Low, Vale Bridge, Haywards Heath, for orchids; Messrs. Jas. Cypher and Sons, Cheltenham, for orchids; Mr. Rogerson, West Didsbury, for orchids.

Bronze Flora.—To Messrs. H. Cannell and Sons, Swanley, for begonias and pelargoniums.

Bournemouth Gardeners' Association.

On Tuesday, January 4, Mr. W. Reeves, Durrant Gardens, Bournemouth, read a very able paper on "The Cultivation of Culinary Peas." After referring to the introduction of the pea to this country, and to its great value as a vegetable in our gardens, Mr. Reeves dealt with the cultivation in such a way as to show how thoroughly he had studied the subject. The pea, he said, required a rich loam of good average depth; deep trenching was advocated to encourage the roots to penetrate freely, and the land should be well drained. The lecturer advocated the sowing of seeds in long boxes, specially constructed where the soil was naturally heavy and retentive; the boxes should be at least 4in. wide and the same in depth, inside measurement, the bottom board being screwed in with well-oiled screws. Having duly prepared the ground and opened shallow drills, the boxes should be placed in them, the screws and bottom board removed, and the young plants left in rows to be earthed-up, and sticks placed to them. Cool peach and similar houses and frames should be used to bring on the young plants in the boxes.

The sowings in the boxes may be made in the autumn or in January. Mr. Reeves referred to a plan he had at one time adopted of raising the young plants in 10in. pots in a cool peach-house; in due time placing the pots in rows in sheltered positions outside and sticking the plants there; but he preferred the long boxes.

Even where the ground was light, said the lecturer, the autumn-raised plants did not fruit many days earlier than those raised from sowings made early in February. Where open-air sowings were entirely depended upon Mr. Reeves then advocated sowings in November, in January and February, in very warm corners in light soils, and successional sowings from the month of March until the middle of June. All maincrop peas, he said, should be grown in the open quarters of the garden, in rows running north and south. Where the soil was retentive the lecturer recommended the sowing of peas in ground that had been previously manured for crops such as those of celery.

In all cases the lecturer advised cultivators to open broad drills for the seeds, and to sow the latter thinly and evenly. As a guard against ravages by mice, the seeds should be first soaked in sweet oil, then coated with red lead, and finally covered with a thin layer of sifted coal ashes before the soil was put on.

A very animated discussion followed the reading of the paper, practically every member present taking part in it, showing how generally interesting the subject was to them. Many questions were asked, and readily answered by Mr. Reeves, who gave some interesting details of experiments that he had made with different varieties to ascertain their earliness and productiveness. A hearty vote of thanks to Mr. Reeves and to Mr. Taylor, who ably presided, brought a most pleasant new year's meeting to a close.

Preston Gardening Society.

The annual meeting of this society was held, under the presidency of Mr. H. Phelips Batten. A letter was read from the President, regretting his inability to be present, and congratulating the members on the success, financially and otherwise, of the society. The President also expressed his pleasure at the increased membership, and the increasing interest taken in the lectures and competitions. The Hon. Secretary (Mr. W. Hobby) then presented his report and balance-sheet, which were of a very encouraging character. There were forty-five members on the books and a good balance in hand. Seven new members joined at the meeting. In moving the adoption of the report, Mr. Warry spoke in eulogistic terms of the work of Mr. Hobby and of his interest in the society, as evidenced by his coming in from Brympton to attend the meetings. Mr. Hobby, in reply, expressed his gratification at the growth of the society, and urged the members to do their best to make the society even more successful next year. The officers were then all re-elected. The prizes, in points, for the year were awarded as follows: E. Brake, 24; H. Brake, 20; G. Irwin, 18; Mrs. Hawkins, 14; J. Hawker, 11; M. Brake, 10; Mrs. Grist, 10; Mrs. Corpe, 9; Mr. Warry, 6; G. Pippard, 5; and others. Special prizes, given by Miss Griffiths, of Yeovil, were won by Messrs. E. Brake, H. Brake, and G. Irwin. There were no competitions, but Mr. Hobby set up a first-rate group of plants, composed of primulas, cyclamen, Roman hyacinths, and maidenhair fern, which attracted much attention.

Croydon Gardeners' Association.

The following is an abstract of the report presented to the annual meeting of this society: The committee, in submitting this report of the past year's work, desire to return thanks to the members and friends who have done so much to promote the objects and aims of the society. Success has attended our efforts in the distribution of knowledge of the various subjects lectured upon at our meetings, and the sincerest thanks of all are due to the lecturers and readers of papers. Another pleasing feature at the meetings has been the display of exhibits which members and friends have brought. The annual dinner, which is an event always looked forward to, was held at the Greyhound Hotel on February 10. The company attending numbered eighty-five. The president, Mr. J. J. Reid, was in the chair, and was well supported by the vice-presidents. Mr. E. H. Jenkins very ably assisted in the duties of vice-chairman. The spring flower show was held at the Horniman Hall (Y.M.C.A.), North End, Croydon, on May 6, and was highly attractive to the big crowd of visitors who came to view it. The sincerest thanks are due to the exhibitors, who, without any monetary benefits offered them, came forward in such a generous manner to give the public a treat in spring flowers. The annual summer outing took place on August 11. Gunnersbury House and Park, the seat of Mr. Leopold de Rothschild, were opened for inspection, and about thirty-five members and friends attended this gathering. The excellent culture carried on at these well-known gardens was keenly noted and appreciated. Following a good luncheon at Kew, a visit was paid to the Royal Gardens, Kew, and the remainder of the day was well spent there. The usual evening visits in June and July were well attended, and thanks are due to the owners of the two establishments, Mr. Panto Ralli, Ashtead Park, and Sir Everard Hambro, K.C.V.O., Hayes Place, for allowing us to inspect their gardens. Those members who attended were highly delighted with the methods of culture found in the gardens, and the respective head gardeners, Messrs. Hunt and Grandfield, were heartily congratulated on their success. These visits are a means of education to the members, especially the younger men. In October last this society competed with other affiliated societies in a class for collection of fruit offered by the Royal Horticultural Society. The first attempt was not good enough to secure the silver cup. It was, however, gratifying to know that members are fully alive to the aims of the society in promoting horticulture generally. That excellent institution, the Gardeners' Orphan Fund, benefits to the extent of £1 10s., collected at the meetings during the past year, and this has been forwarded to the secretary.

National Vegetable Society.

There was a meeting of this society on the 11th inst., when the Schedule Sub-Committee appointed by the General Committee presented the rough draft of the schedule of the prizes for the show on September 28, nearly £200 being offered in prizes. The chairman reported that Lord Howard de Walden had kindly promised seven guineas as the second prize in the class for twelve dishes of vegetables, distinct, the president, the Duke of Portland, K.G., giving the first prize. The National Vegetable Society gives twenty substantial prizes for single-dish classes, and there are valuable open classes, with liberal special prizes. Lord Northcliffe, through Mr. Foster, has promised most interesting and valuable prizes for small holders in several classes, ranging from twenty to two acres. The secretary hopes to have the schedule ready in a very short time, and a large number are to be issued. The treasurer reported several additional subscribers and vice-presidents, and invites those interested in vegetables to become members of the society.

Bristol Gardeners' Association.

A meeting of this society was held on December 30, 1909, at St. John's Parish Rooms, and presided over by Mr. W. E. Budgett. A departure was made from the usual routine, the meeting being given up entirely to the young members. Through the kindness of Mr. Budgett prizes had been offered for the best essays upon gardening, and there was a good response from the young men. Five entered, and prepared really excellent papers upon various subjects. Mr. Whiting dealt with "Pleasures and Grievances of Under-gardeners"; Mr. Extence, "Winter Flowering Carnations"; Mr. House, jun., "Insect Pests"; Mr. Webber, "The Origin and Culture of the Cucumber"; and Mr. Newman, "The Chrysanthemum." The three first-named were awarded the prizes in the order given. There was general and pleasurable surprise as to the way in which the papers were prepared and delivered, and the society have every cause for congratulation on the ready response the young members have made. Some societies appear to have a difficulty in keeping the young men interested in the meetings, but there is no such difficulty at Bristol. A goodly number regularly attend, and receive every encouragement by being given something to do; holding competitions for spray bouquets, floral designs, etc., also finding a place for two or three on the committee, one holding the office of librarian, one as registrar. For three flowering plants Mr. Shelton won among several exhibitors, Mr. Gostling had three points and Mr. Curtis one for orchids.

Cardiff Gardeners' Association.

The recent fortnightly meeting of the above association was held at the Sandringham Hotel, Mr. Mark Toy presiding. A vote of condolence was passed to the chairman of the association, Mr. J. Mountney, on the death of his father.

Mr. Horne, gardener to Major-General Lee, The Mount, Dinas Powis, gave a most instructive lecture on "The Cultivation of Winter-flowering Begonias," dealing in a most practical manner with the propagation and after treatment of these most popular plants, advocating propagation by leaves as giving the best results. He dealt with the B. Gloire de Lorraine group, and with the hybrid sections principally.

The debate, which was opened by Mr. Cossom, was taken up in a most enthusiastic manner by the members, especially in the direction of the cause and prevention of "rust." Mr. Horne answered the various questions put to him, and the chairman, in closing the meeting, announced that Mr. J. Julian would give the next lecture, on "Lifting and Transplanting Trees and Shrubs."

BUY THE BEST

WHY purchase seed of inferior quality for your garden, when by sending to Eckford, at Wem, the best can be obtained? Every seed sent out by me is carefully examined by hand, and brighter colours, larger flowers, and longer stems will be the result of growing seed bought from Wem.

Villa (C) Collection. 12 splendid varieties, suitable for exhibition, 50 seeds of each, 2/9.

Villa (E) Collection. 12 extra varieties suitable for exhibition, 25 seeds of each. 1/6.

A Specially written booklet on Sweet Pea Growing given with every order.

FREE. Send us your name and address and we will forward you, entirely free of charge, our artistic coloured catalogue for 1910. This contains full particulars of Sweet Peas, Vegetable, and all seeds for the garden.

Eckford's Giant SWEET PEAS

HENRY ECKFORD, F.R.H.S.,
DEPT. 115, WEM, SHROPSHIRE.

IN THE HIGH COURTS OF JUSTICE

Edinburgh, an Action brought by CHAS. P. KINNELL & CO., Ltd., against A. Ballantine & Sons, Boness, N.B., resulted in a judgment in favour of Plaintiffs, interdicting and prohibiting the Defendants from using the words "HORSE SHOE" as descriptive of, or in connection with boilers NOT BEING OF THE PLAINTIFFS' MANUFACTURE, sold or offered for sale by the Defendants without clearly distinguishing such boilers from the boilers of the Plaintiffs.

WE WARN BUYERS AND THE TRADE THAT PROCEEDINGS WILL AT ONCE BE TAKEN AGAINST ANYONE INFRINGING OUR RIGHT.

NO BOILERS ARE

"HORSE SHOE" BOILERS

UNLESS THEY HAVE THE NAME CHAS. P. KINNELL & CO., LTD., CAST UPON THE FRONT, and buyers will protect themselves and our rights by at once intimating to us if any attempt is made to pass off as a "HORSE SHOE" boiler, any boiler not being of our manufacture.

IMITATION IS THE SINCEREST FORM OF FLATTERY, but unscrupulous traders for a little extra profit may try to pass off another boiler, which has not all OUR IMPROVEMENTS, as being "just as good"

GET A "HORSE SHOE" BOILER AND ENSURE THE BEST RESULTS.

It has taken years of experience to perfect it, and its NAME "HORSE SHOE" is the "Hall Mark" of EXCELLENCE.

Information as to any attempted infringement of our rights will be gratefully received by **CHAS. P. KINNELL & CO., LTD.** 'Phone: Hop372 (2 lines). Wire: "KINNELL, LONDON."

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

VALLOTA PURPUREA.—Amateur: The plants should for the present remain undisturbed, and be kept quite dry at the roots. A position in a greenhouse from which the frost is excluded is the best that could be given the plants.

PHLEBODIUM AUREUM.—W. H. P.: This handsome fern will grow vigorously in a compost consisting of fibrous loam and peat three parts each, and leaf-mould and coarse sand one part each. The peat and loam should be used in a rather rough state, and the finer particles that are shaken out in the process of breaking up should be put on one side to use for some other purpose. The pots should be efficiently drained.

SPECIMEN IXORAS.—T. Smith, Wilts: Specimen ixoras of large size which were popular a quarter of a century or so ago, are no longer appreciated, and it will probably be advisable to replace those in the collection of which you have recently taken charge by bushy plants of smaller size. As they have become leggy, and are in other respects unsatisfactory, we suggest you ask your employer whether he has any objection to their being replaced. If he has none, keep the old specimens for a few weeks longer, then take cuttings from them, and when it is seen that these are rooting, throw the specimen plants away.

KILLING HARES AND RABBITS.—M. B., Gloucester: It is very vexatious to have crops destroyed by hares and rabbits as in your case, but you must not resort to poison as a means of ridding your garden of them. If you do so you may incur the risk of being prosecuted under the Ground Game Act, 1880; or, what is more important, of causing injury to the health of some person who may find the dead animal and use it for food. Section 6 of the Act provides that no person having a right of killing ground game under the Act or otherwise shall use any firearms for the purpose of killing ground game between the expiration of the first hour after sunset and the commencement of the last hour before sunrise; and that no such person shall, for the purpose of killing ground game, employ spring traps except in rabbit holes, or employ poison; and any person acting in contravention of this section is, on summary conviction, liable to a penalty not exceeding two pounds. It will be seen that the Act expressly prohibits the setting of spring traps in the open for the purpose of taking hares and rabbits. If a spring trap is employed at all it must be set actually in the rabbit hole, and it has been held in a Scotch case that "rabbit-hole" does not include the run at the mouth of the hole, but is confined to "that part of the ground which is inside the ground and covered by the roof."

WALLS VERSUS GLASS.—B. M., Lancashire: We are certainly not in agreement with those who regard the production of good crops of peaches and nectarines on open walls as practically impossible. On the contrary, we have stated in these pages more than once that, provided the climatic and soil conditions are favourable, excellent crops of these fruits can be obtained from trees trained to open walls. The trees require equally as much care as those grown under glass. It is possible that the conditions which obtain in your district will not be sufficiently favourable to enable you to achieve success, and we advise you to have a look round some of the best gardens and see what is being done in them. The case in favour of glass culture may be thus stated: Owing to the changeability of the British climate, more especially during the early spring months, the cultivation of choice fruits against open walls is attended with considerable risk, and the cultivator has to be prepared for the unpleasant experience of seeing the whole of the prospects of a crop destroyed by a single night's frost, or a spell of cold and otherwise unfavourable weather at a critical period. It occasionally happens that, stimulated by a period of warm, genial weather, the trees come into bloom early, and then as soon as the flowers are fully developed there is a change to colder conditions—it may be a heavy rain followed by a sharp frost—and the flowers are destroyed. In other years the flowers pass through their several stages, and later on the greater proportion, if not all, of the young fruits are destroyed. The destruction of the crop is frequently followed by blistered leaves and browned shoots, which are sure indications of injury to the trees. In the northern counties, and in districts in which the rainfall is heavy, peaches and nectarines cannot be successfully cultivated in the open, as the wood fails to ripen, and therefore, to have these luscious fruits in perfection, the aid of glass is essential.

PLANTING FRUIT TREES.—F. W. S. G., Essex: We quite agree with you that a practice which has been found to give good results should not be changed until it has been conclusively proved that another is decidedly better. At the same time, the observant cultivator, while following the course of procedure by which he has achieved his greatest success, will carefully examine every deviation therefrom that is advised by those whose position is such as to command respect.

TEA-SCENTED ROSES FOR THE GARDEN.—W. F. K.: Tea-scented roses will thrive in light and heavy soils provided the drainage is efficient. They are not so suitable for low-lying cold soils as some of the other sections, for on soils of this description they fail to ripen their wood, and unripened growth of roses quickly succumbs to severe frosts during the winter. The shoots of dwarf plants can be readily protected from severe frosts by drawing the soil in sufficient quantity about them to bury from six to eight inches of the lower part, this being done in much the same way as celery is earthed up. To protect standards insert a rod firmly in the soil, and of sufficient length to stand eight or nine inches above the tops of the shoots. Draw the latter about this and cover them with a handful of straw, or a few fronds of bracken to be fastened to the stake at the top and just under the heads. Those of moderate growth should be pruned to the second or third prominent bud from the base, but the varieties with sufficient vigour to be used for pillars and walls should have the shoots that flowered in the previous year cut away at the winter pruning and the young rods be laid in to take their place, the soft portion only being taken off.

CHRISTMAS ROSES.—R. B. S., Essex: You are under some misapprehension with regard to the relative earliness of the flowering of Helleborus niger and its large-flowered variety. You might not have clearly understood what you were told by your friend who, you say, grows both in considerable quantities. The specific form commences to bloom about Christmas, and continues to yield of its flowers well into January. H. niger maximus, on the other hand, commences to bloom about the middle of December, and continues in bloom for some time. We suggest you should not limit yourself to one of the forms, but grow both in equal quantities, for if the flowers of the type are small in comparison with its large-flowered variety, they are quite large enough for decorative purposes, and are of much value for providing a succession. In growing the Christmas roses, as in your case, for the supply of flowers for decorative purposes in a cut state, the shelter of glass throughout the period of flowering will be necessary to protect them from frosts, and maintain such temperature as will ensure the expansion of the flowers in severe weather. It is an excellent plan to grow them in a bed just large enough to receive in the autumn the frame for sheltering them, and if the position is such that they will be screened from the sun during the hottest part of the summer days, it will be an advantage. The plants are sometimes grown in beds and lifted in the autumn and put in frames, but unless they are lifted with large balls of soil and packed in the frames without these being broken, many of the buds will not open so kindly as could be wished. Very good results can be obtained from pot culture. The plants should be grown in comparatively large pots, and be plunged in a bed of ashes that has been made up in a rather shady position. When coming into bloom they can be taken to a pit or frame, or be placed in the greenhouse. A temperature of about 55 degrees may be maintained if it is desired to accelerate the development of the flowers, but they should not be forced in a strong heat. It remains to be said that a deep, friable loam is the best suited to the requirements of these hellebores, and if the position is an open one the bed should be mulched in spring.

EARLY CHRYSANTHEMUMS.—H. S., Chelsfield: Good early-flowering chrysanthemums of terra-cotta shade are Cactus, Comtesse Foucher de Cariel, and Jack. Good pink varieties are plentiful, but the range of pink colouring is a wide one; the following are all good: Dora Blick, Francois Vuillermet, Goacher's Pink, Kitty, Mabel Roberts, Perle Rose, and Pink Bedder.

OUTDOOR TOMATOES.—B. R. W., Sussex: If you require a continuous supply of tomatoes extending over a considerable period, a glass structure, in which the plants can enjoy full exposure to the sun, and a free circulation of air, is essential. If you simply require a supply of fruit late in the season, an outdoor crop will meet your requirements. There is some uncertainty as to the results, because the tomato plant requires a high temperature and rather dry atmospheric conditions. In cool, wet seasons the growth is so slow that but few of the fruits ripen. Much, of course, depends upon the district, and as you reside in one of the southern counties you should in the majority of years obtain a good return. The following, briefly stated, is the best course of procedure: One of the chief points in the outdoor culture of tomatoes is to have plants well established in five-inch pots, bearing a truss of fruit when bedded out at the end of May. To obtain plants of this description sow the seed in March, pot off as soon as large enough into three-inch pots, and when these are well filled with roots shift into others five inches in diameter. Plant about two feet apart, against walls or in lines in the open, the lines to be three feet apart, and the plants to be eighteen inches apart in the rows. In either case train to a single stem, stop when three or four feet high, and regularly remove the laterals by pinching them off when two or three inches long.

Proposed Amalgamation of Edinburgh Horticultural Societies.—At a well-attended meeting of the joint councils of the Royal Caledonian Horticultural Society and the Scottish Horticultural Association on the 7th inst., with Mr. J. W. McHattie in the chair, the position of the two societies was fully discussed. On the motion of Mr. W. H. Massie, it was unanimously resolved to report to the annual business meetings of the two societies that at a joint meeting of the councils held on January 7, it was agreed to recommend to the members that in the interests of Scottish horticulture, it is highly desirable that negotiations be entered into with a view to their amalgamation.

OBITUARY.

◆

MR. ROBERT SMITH.

With much regret we have to record the death of Mr. Robert Smith, which occurred at Brickendonbury, Hertford, on the 10th inst., after a short illness, in his seventy-second year. In the Gardeners' Magazine of November 13, 1909, we had the pleasure of giving a portrait of Mr. Smith, accompanied by a sketch of his horticultural activities during his long and strenuous life. It is not necessary to recapitulate what has been so recently written with reference to this singularly able gardener and estimable man, but we would mention that he attributed much of his success in life to unremitting endeavour, and to taking full advantage of such opportunities as may arise for the acquisition of knowledge and advancement in life. Mr. Smith was an all-round gardener in every sense of the word, but he specially distinguished himself in the cultivation of hardy fruits, and both at Presdales, Ware, now the residence of A. G. Sandeman, Esq., and at Brickendonbury, the residence of E. E. Pearson, Esq., he proved to demonstration that the gardens had possibilities in fruit production of a high order. As evidence of his success, the silver cup offered by the Hertford Horticultural Society, for hardy fruit grown in the county, was awarded to him four times in eight years, notwithstanding the fact that two years ago Mr. Smith was seriously ill for a considerable period. Mr. Smith was of a modest and retiring disposition, and was highly esteemed, both by his employer and those who served under him.

MR. ROBERT TODD.

We regret to record the death of Mr. Robert Todd, which took place suddenly on the 2nd inst., at his residence, Shooter's Hill Gardens, Eltham, Kent, in his sixty-seventh year. Mr. Todd had only settled at Eltham a few months ago, on retiring from Woolton Wood after the death of his late employer, Holbrook Gaskell, Esq., J.P. Mr. Todd received his training at Dalkeith Gardens as journeyman, thence he went to Alnwick Castle as fruit foreman, a position he held for six years. This led to his appointment as head gardener to A. B. Stewert, Esq., of Rawcliffe, Largside, Glasgow, and Avoig Hall, Bute, where he was thirteen years. Whilst at Rawcliffe Mr. Todd proved his abilities, being a foremost exhibitor at the leading exhibitions at Glasgow, Edinburgh, Dundee, Carlisle, etc., principally with plants, filmy and exotic ferns, and fruit. On the death of his employer he was appointed superintendent of grounds of the 1886 Edinburgh Exhibition. His next step was to take charge of the Woolton Wood Gardens in 1887, which, at that period, held one of the most important collections of orchids in the North. Mr. Todd was one of the promoters of the Woolton Gardeners' Mutual Improvement Society, and was a consistent worker for twenty-one years. He was also a warm supporter of the Gardeners' Royal Benevolent Institution, serving on the committee of the Liverpool Auxiliary from its infancy, and was ever willing to assist in the advancement of gardeners and gardening. Mr. Todd leaves a widow, two sons, and two daughters.

FORTHCOMING ENGAGEMENTS.

THURSDAY, January 20.—Gardeners' Royal Benevolent Institution; Annual Meeting, Election, and Supper; Simpson's, Strand.

TUESDAY, January 25.—Royal Horticultural Society: Committees meet at 12 o'clock; Lecture at 3 p.m. on "Intensive Cultivation of Vegetables in Madeira," by Miss Armitage; Scientific Committee at 4 o'clock.

The Harry Veitch Portrait will be on view at the Royal Horticultural Hall, and a dinner to Mr. and Mrs. Harry Veitch will be given in the evening.

SATURDAY, January 29.—French Horticultural Society of London; Twenty-first Anniversary Dinner at the Café Royal, Regent Street, under the presidency of Mons. Philippe de Vilmorin.

ROSES IN THE OPEN AIR AT CHRISTMAS.

At Christmas, and even on New Year's Eve, there were some lovely blooms of the variety Mrs. W. J. Grant growing on a pillar-trained plant in my garden. The buds were subjected to about 12 degrees of frost a fortnight ago, but they were apparently not seriously damaged. They have not been protected in any way. The petals of this lovely rose always seem more delicate than those of very many other varieties, and I am much surprised to see these now open so pure, sound, and rich in colour.

I first put out the plant in a greenhouse, but as it interfered with some of the other occupants, I removed it to a pillar in the open border. Throughout the past summer and autumn many buds have formed and developed well, but I did not expect to be able to gather fine flowers on the last day of the old year.

G. B.

NEW PLANTS, ETC.

◆

BULBOPHYLLUM CAMPANULATUM.

An elegant little orchid that belongs to the Cirrhopetalum group. It comes from Sumatra. The whole plant is less than six inches high. The flowers are rosy-purple, borne in a little umbel depending from the curved apex of the scape. Bot. Mag., t. 8282.

CISSUS ADENOPODUS.

This climber hails from Uganda, bears its panicles of tiny flowers in the autumn, and ripens its round black fruits in spring, under glass. Its trifoliate leaves are green above and bright red beneath, both surfaces, as well as the footstalk and stems, being hairy. Bot. Mag., t. 8278.

Hamamelis mollis. — A distinct and beautiful winter-flowering shrub is found in the comparatively new Witch Hazel (Hamamelis mollis), this genera being already represented in gardens by the well-known H. virginica and H. arborea. The species under notice has broad rugose leaves which are densely clothed with fine hairs, the stems of the young branches having also a grey covering of fine downy hairs. The flowers are yellow, formed of narrow strap-like petals, which are curiously twisted, whilst the calyx lobes are coloured chocolate. It flowers in the open from the end of January onwards, and the blossoms remain in good condition right into April, the rigours of winter having no baneful effect upon them. Specimens of Hamamelis mollis flower in a very small state, and while progress at first is rather slow, yet in a few years it attains a size in which the specimen gains in interest and charm, so that when in full flower it is a most conspicuous object in the shrubbery.—Thomas Smith.

The Cornel Tree (Cornus Mas) is a common plant in many shrubberies, but how rarely do we find it receive full recognition as a spring-flowering subject. Already the leafless branches are thronged with tiny knob-like swellings that in a few months will burst into golden flowers. When well grown and suitably placed, a well-flowered specimen readily attracts attention. It succeeds in indifferent soil, provided it receives a fair amount of sunshine in order to mature the wood. Pruning should be carried out as soon as the flowers fade, and is particularly beneficial while the plants are young, as while imparting greater strength to the main stems, it also secures greater compactness with the branches, consequently a specimen gains in effectiveness when in flower. The Cornel Tree produces its flower in advance of the leaves—from February to April, according to the season—so that where it can be planted in front of some evergreen, the latter will act as a background, against which the yellow flowers will appear in strong relief. —Thomas Smith.

In consequence of a new order from the Meteorological Office, the thermometer on the grass is now set at sunset, instead of at 9 a.m., as before (this accounts for the higher reading on the grass).

Saxifraga Burseriana. — Few hardy plants are invested with so great beauty and interest as that surrounding this little alpine subject. Throughout the greater part of the year it calls for no particular notice, the evergreen, close set, juniper-like stems form a mat only an inch or two above ground level. In February the scarlet-coloured buds appear, and soon the stems begin to elongate, and in March these commonplace tufts bristle with great white blossoms as chaste and pure as the snow which often enshrines these precocious gems. It is a species that succeeds in rich limestone soil, preferably in a well-drained position, and flowering best when fully exposed to sun. It increases with wonderful rapidity, considering the diminutive habit of the plant. One can scarcely overplant Saxifraga Burseriana, and every rock garden will gain in character and interest where this species and its varieties are liberally represented.—THOMAS SMITH.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

Situations Wanted.

GARDENER (Head).—Advertiser seeks RE-ENGAGEMENT in first-class establishment, where several are employed; life experience, and thoroughly practical in all branches; five years as head in last situation; can be strongly recommended. Apply DUNKLEY, The Gardens, Mill House, Bourne End, Bucks.

F. WESTRON, Rhinefield Gardens, Brockenhurst, will be pleased to recommend R. MIDDLETON, age 28, as GARDENER (Head of two or three); 12 years' experience Inside and Out in good places; married when suited; three years' reference from present place.

GARDENER (Head of two or good Single-handed); good all-round experience with Vines. Cucumbers, Tomatoes, Fruit, Flowers, Lawns, and Vegetables; married, two children; excellent references. B. KILLINGWORTH, 15, Queen's Road, Upper Norwood, S.E.

HER GRACE THE DUCHESS of DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

SITUATION as GARDENER (Head, where two or more are kept); married; age 40; one son out; 7½ years' good character; leaving through no fault. F. PALMER, Victoria Lodge, Chapel Road, Hythe, Southampton.

GARDENER (Head Working); age 33; married. H. MARKHAM, gardener to Viscount Enfield, Wrotham Park, Barnet, strongly recommends a gardener of good practical experience in choice fruits, plants, and the general requirements of a good place; strong and energetic.

GARDENER (Head Working).—Thorough practical experience in all branches of the profession, Inside and Outside; good references; married, no family. W. S., 16, Warwick Place, Maidstone, Kent.

GARDENER (Head Working); life experience in Early and Late Forcing of Fruit, Flowers, and Vegetables; Certificate from R.H.S. Examination in Horticulture; age 40; nearly six years' excellent reference; 10 years' previous. H. CRAWLEY, 3, Fair View, Seaford Road, Wokingham, Berks.

GARDENER (Head Working); life experience in all branches; 10 years last place, 6 as head; highly recommended; age 30; married when suited. H. J. KING, 1, Pretoria Cottages, West Lane, South Hayling, Hants.

GARDENER (Head Working), age 30, practical man all branches, seeks SITUATION as above; highest references as to character and abilities. J. HEARN, Grendon Underwood, Aylesbury, Bucks.

GARDENER seeks SITUATION; Single-handed or with help; good experience; good references; age 28; single. E. CHANDLER, 38, Newgate Road, St. Leonards-on-Sea, Sussex.

GARDENER (Single-handed or with help); life experience; age 28; married when suited; good references; abstainer. W. BAIGENT, Park Cottages, Lyne, Chertsey, Surrey.

GARDENER (good Single-handed, with help), good all-round Man, in all branches, Inside and Out; would take moderate wage for a comfortable place; middle-aged; or would take a good jobbing situation; excellent testimonials from last and previous employers. F. OSBORNE, 48, Bradshaw Road, Watford.

GARDENER (Single-handed) or Leading Hand in Pleasure Grounds and Kitchen Garden; good references; abstainer. Address MOUNTAIN, Kirklees Gardens, Brighouse, Yorkshire. (No circulars.)

GARDENER (Single-handed or good Second), married; age 28; 10 years' experience in all branches; early and late forcing; willing to make himself generally useful; used to driving gas plant, etc.; can be highly recommended. A. BEACHER, 2, Church Lane, Warblington, Havant, Hants.

GARDENER seeks SITUATION, Second or First Journeyman; thoroughly experienced Inside and Out; height 5ft. 10in.; age 27; Single; 5 years' good reference last situation. Apply R. CLARK, Hasselor Hill, Alcester, R.S.O.

FOREMAN (Inside).—Mr. DREDGE wishes to recommend his Foreman, as above, to any Gardener requiring a good man. The Gardens, Letton Hall, Thetford, Norfolk.

THOMAS W. MEAD, Park Valley Farm, Park Street, near St. Albans, Herts, requires SITUATION as FOREMAN (General, where six or more are kept); 10 years' all-round experience; age 27; good testimonials.

GARDENER, age 25, highly recommended as FOREMAN (Inside and Out), or as SINGLE-HANDED; good practical experience; married when suited. B. HARRIS, Canons Park Gardens, Edgware, Middlesex.

MANAGER or FOREMAN in first-class Market Growing establishment; well up in Cucumbers, Tomatoes, Grapes, Chrysanthemums, Carnations, and general Market Stuff; first-class reference from present situation; age 37; married, one child; Cucumbers a speciality. A. LEA, 3, Henry Street, Kenilworth.

JOURNEYMAN (Inside); good establishment.—Mr. GRANT, Burghley Gardens, Stamford, confidently recommends R. LAWES, as same; age 23; eight years' experience; good references; opportunity in Colonies acceptable. Apply as above, or to LAWES, Crampmoor, Romsey.

JOURNEYMAN (Inside and Out), age 21; three years' experience; well recommended. WM. C. FINNEY, 34, Derby Street, Prescot, Lancs.

JOURNEYMAN, First, age 23, seeks SITUATION in good establishment; 8 years with fruit and plants; good knowledge of fruit; Bothy pref.; distance no object. S. C. LOCK, The Gardens, Hemsted Park, Cranbrook, Kent.

JOURNEYMAN (Inside or Inside and Out), age 22; six years' experience in Fruit and Plant Houses; good references; abstainer. A. CRANE, 73, Elsinore Road, Forest Hill, S.E.

JOURNEYMAN (Second or Third); four years and a-half experience; good reference; strong and active; age 19; height, six feet. W. BENNETT, Wisteria Cottage, East Preston, Worthing.

MR. J. FRASER, late of Ottershaw Park Gardens, Chertsey, highly recommends J. PARMENTER as JOURNEYMAN (First, Inside); age 23; disengaged through place being sold. Apply J. PARMENTER, Hutton Mount, Brentwood, Essex.

GROOM-GARDENER, married, age 23, requires SITUATION to look after Pony and fill up time in Garden. Apply W. BURT, 1, The Villas, Grayshott, Hants.

GARDEN LABOURER, single, requires SITUATION as above; aged 25 years; used to garden; can milk if required, and willing to make himself generally useful; used to pony. THOMAS JOHNSON, Walk Wood, Crabbs Cross, Near Redditch.

A. H. DICKS, Parkhurst, Great Barr, wishes to recommend J. MARSH for General Work; 4½ years' experience; age 21. 65, Emery Street, Walsall.

CHRYSANTHEMUM GROWER.—W. SIBLEY, age 31, for 19 years with Messrs. Lowe and Shawyer, is in want of a SITUATION as above; Messrs. Lowe and Shawyer would reply to any enquiries. 16, St. John's Road, Uxbridge Moor, Middlesex.

IMPROVER, age 16, seeks SITUATION in good establishment; three years' good character; can be well recommended. Apply F. TULL, Wootton Bassett Road, Purton, Wilts.

WORK wanted by thoroughly experienced MAN in Lopping and Topping large or dangerous Trees, making them safe; by day or job; own risk; testimonials if required. GEORGE BANKS, 20, Caroline Road, Wimbledon, Surrey.

YOUNG MAN, age 21; six years' experience in Grapes, Peaches, Chrysanthemums, Ferns, and different Pot Plants and Cut Stuff; well recommended. R. PETERSEN, 76, Williefieldway, Hampstead Garden City, Hendon, N.W.

YOUNG MAN seeks SITUATION as GARDENER (Second, Inside and Out, where three or more are kept); good references; capable, willing; not afraid of work. Apply to GARDENER, 127, St John Street, Lichfield, Staffs.

YOUTH seeks Situation Inside as GARDENER (Under); over four years' experience Inside and Out; with good character; age 19 next March. Apply, stating wages, to F. HABBARD, Gt. Fakenham, Thetford.

VOL. LIII.—No. 2,934. SATURDAY, JANUARY 22, 1910.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Water in Soil.

Of the several factors that have a distinct bearing on the growth of plants water is unquestionably one of the most important. By means of its solvent power it is the medium through which the solid substances are conveyed to the leaves to undergo the necessary changes and be then carried to the different parts of the plants to be utilised in the formation of tissue, or to be stored up in seed, stem, tuber, or bulb for future use. Recognising the importance of water in the economy of the plant, Professor Gamble, of the Ontario Agricultural College, carried out a series of investigations for the purpose of studying the action and movements of water in the soil, and his report on them is of considerable practical importance. He points out that the water, with its dissolved plant food, is absorbed from the soil by the roots of the plant, and is then carried by the upward flow of the sap to the leaves. When it reaches them some of the water, and all the salts, are retained for various purposes in the economy of the plant. Much more water reaches the leaves than is required for nutritive purposes, the excess being necessary for the conveyance of the plant food from the soil; and when this has been accomplished the excess is given off by the process known as transpiration. Under ordinary conditions plants part with large quantities of water by transpiration, and, in Professor Gamble's opinion, before it is possible to properly understand the importance of the moisture which reaches our gardens and fields by natural agencies, it is necessary to clearly understand what relation this amount holds to the amount that is actually required for the production of good crops of different kinds. Investigations have been made with a view to ascertain how much water is required to produce one pound of dry matter in some of the leading crops. From the table given by Professor Gamble in summarising the results obtained by Professor King, we learn that in the case of barley 505.7 pounds of water were required for the production of one pound of dry matter, and that this quantity of water was 2.8 times the season's rainfall. We also learn that the yield obtained under experimental culture was 2.6 times the yield in the field. Much less water was required in the case of clover and oats, but it was considerably in excess of the season's rainfall, and the experimental crop was about double that obtained under ordinary cultivation in the field. In stating the results obtained it is hardly necessary, we should point out, that while liberal supplies of water in well drained soils is an important factor in crop production, whether it be in garden or on the farm, the fertility of soils does not wholly depend thereon. Climatic conditions, the system of manuring, and the method of tillage have an important bearing on the growth of the plants; but it is suggested, were the water supply under greater control than is usually the case, the crops would be materially increased. Professor Gamble conducted a series of experiments for ascertaining the relative amount of water which soils of different kinds are capable of holding, and also to learn what effect the fineness of the particles had upon the absorptive power of soils. The results show that the extent to which soils are capable of absorbing and retaining moisture varies considerably. This is exactly what might have been expected, and it is not surprising to learn that the water-holding capacity of a soil increases with the fineness of its particles. This fact is regarded as having an important bearing upon the season of the year in which clay soils are broken up, and the results are considered by Professor Gamble to emphasise the necessity of cultivating them in the autumn or early in the winter to expose the soil brought up from below the surface to atmospheric agencies, and the disintegrating action of frost. This is in accordance with the views that have long been held in this country, but within recent years there has been a tendency to recommend the spring season as that in which clay soils should be broken up. The cultivator has, of course, not only to consider the quantity of moisture contained in a soil, but he must take into account the conditions most favourable to seed germination, and to the rapid development of the root system. We need hardly say that a soil which has been thoroughly pulverised by the weather is more conducive to the growth of the plant during its earlier stages than are those in a more or less rough state. Not less interesting was the experiment conducted to determine the rate at which water rises by capillary attraction in different soils. In this experiment the soil was steam dried, and passed through a fine sieve, and put in glass tubes three feet long and three-quarters of an inch in diameter. The experiment extended over three months, and in the result the water in the tube containing sand reached the surface in three days while the height of the water in the tube containing clay was 28¾ inches at the end of three months, while in the case of the two tubes containing loam the height of the water was 32½ inches and 33 2-3 inches respectively at the end of the same period. These figures are of interest as showing that when a soil has become very dry, it

MR. N. N. SHERWOOD, V.M.H.,
President of the National Sweet Pea Society.

lifts water very slowly, a point of some interest, as evidence of the value of a layer of loose dry soil on the surface in checking the loss of water by evaporation. As so well known to the observant cultivator, the loss of water by surface evaporation from the soil is large during the earlier portion of the season of growth, and especially when the ground is left undisturbed for any length of time. Investigations were conducted by Professor Gamble to ascertain the exact loss from stirred and unstirred soil, and the result showed that the percentages in the case of three stirred soils were 21.4, 21.95, and 17.84 during fourteen days, and in the case of the unstirred soils they were 27.2, 27.37, and 27.71. These figures fully confirm the views of those who regard surface stirring as an important aid in conserving the moisture in soils, and the results generally bring into strong relief the necessity of thorough cultivation in crop production.

Mr. N. N. Sherwood, V.M.H.—It gives us special pleasure to present to our readers the portrait of Mr. N. N. Sherwood, head of the great wholesale seed firm of Messrs. Hurst and Son. Entering the firm as a quite young man, Mr. Sherwood applied himself so diligently to business that he rose rapidly from the ranks, eventually becoming manager, partner, and proprietor. Mr. Sherwood has never shirked the responsibilities of life, and this, joined to his business ability, unfailing good humour and broad charity, has placed him in an unique position in the world of horticulture. He was one of the first sixty horticulturists to receive the Victoria Medal of Honour in Horticulture; he has been Master of the Worshipful Company of Gardeners; he has provided horticultural scholarships; he was treasurer of the Royal Gardeners' Orphan Fund until quite recently, and has been succeeded in that office by his son, Mr. Edward Sherwood; he has been president of the Nursery and Seed Trades' Association, and, until this year, has been treasurer of the National Sweet Pea Society since its foundation, but was recently unanimously elected to the presidency of that body. He is a trustee of the Gardeners' Royal Benevolent Institution, and presided over the friendly supper held at the close of the annual meeting and election of that body during the present week. It will be seen from this brief account that, though eminently successful in business, Mr. Sherwood has not forgotten the claims of charity, but the account does not show that, besides devoting much time to the work of the gardening charities and other good works, he has also given liberally to all of them, and set a splendid example of loving one's neighbour as one's self. His gifts have been princely, and always inspired by a deep sympathy for the needy and helpless. It was Mr. Sherwood who founded the convalescent fund in connection with the United Horticultural Benefit and Provident Society. Mr. Sherwood has enriched our gardens by the introduction, through his firm, of many fine novelties in flowers and vegetables. Fixity and purity of seed stocks he has always put at a very high standard, and a visit to the trial grounds at Kelvedon and Fering show what great pains and care are taken to maintain that standard. Mr. N. N. Sherwood has, since his severe illness, allowed the chief burden of his large business to fall upon the shoulders of his son, Mr. E. Sherwood; and so, with strength restored, we and all who know him sincerely hope that there are many years of health, usefulness, and happiness before him.

Our Coloured Plate.—With the present issue we present our readers with a coloured plate representing one of the most brilliant of sweet peas. The variety is Edna Unwin, raised by Mr. W. J. Unwin, of Histon, Cambridge. It belongs to the bright orange-scarlet group, and gives that touch of brilliant colouring so admired in the garden, and so very necessary at exhibitions. Edna Unwin has colour, form, and size to recommend it, and it is also of fine free growth, and everyone knows that Mr. W. J. Unwin has a splendid reputation for the fixity of the varieties he introduces.

Peter Barr Memorial Fund.—Large numbers of daffodil lovers having expressed a desire to see a fund raised for the purpose of commemorating the life and work of the late Mr. Peter Barr, V.M.H., the members of the Royal Horticultural Society's Narcissus Committee recently met to consider the matter. Various proposals were put forward, but those finding most favour were: The institution of a Peter Barr Memorial Medal, to be awarded annually in connection with work among daffodils, and the provision of a fund for the maintenance of an orphan through the medium of the Royal Gardeners' Orphan Fund. To carry out these proposals a general committee, consisting of the members of the Royal Horticultural Society's Floral and Narcissus Committees, was at once formed, with power to add to their number, and five members of each body were nominated to form an executive committee, as follows: Mr. William Marshall, V.M.H., chairman; Mr. Henry B. May, treasurer; Mr. J. T. Bennett Poë, M.A., V.M.H., Mr. William Cuthbertson, J.P., the Rev. Joseph Jacob, Mr. R. Hooper Pearson, Mr. William Poupart, Mr. Charles E. Shea, Mr. Walter T. Ware, and Mr. Charles H. Curtis, hon. secretary. Mr. Peter Barr's great work was among daffodils, and he may be said to have created the British daffodil industry; but he also took an active part in the improvement and introduction of tulips, hellebores, Michaelmas daisies, lilies, and other hardy flowers. He was also one of the founders of the Royal Gardeners' Orphan Fund, and served on the committee of that charity for many years. In these and many other ways Mr. Peter Barr did so much to advance horticulture that the committee appeal confidently to the great flower-loving public for a sufficient sum to carry out the above proposals. Cheques and postal orders, crossed "London and Provincial Banking Company," should be sent direct to the treasurer, Mr. H. B. May, Stanmore, Chingford, Essex. Copies of this appeal for distribution among members of daffodil and other floricultural societies will be gladly sent on application to the hon. secretary, Mr. Charles H. Curtis, Adelaide Road, Brentford, Middlesex.

R.H.S. Bulb Show.—We are asked by the Rev. W. Wilks to remind our readers that an exhibition of bulbs will be held at the Horticultural Hall on March 8 and 9. The schedules comprise numerous classes for hyacinths grown in soil in accordance with the orthodox practice, and classes for hyacinths, tulips, and narcissi grown in moss fibre, and a class for hippeastrums.

Beautifying London Railway Stations.—With the laudable desire of improving the amenities of travel, most of our railways offer annual prizes for the best-kept station gardens. The results usually please both passengers and porters, in addition to the other people concerned. The District Railway, now that its tunnels have been purged of fumes inimical to horticulture, has, we learn from the "Railway Gazette," adopted a "competition for improved appearance of stations and adjoining railway premises." The necessary soil for the plots is to be provided, together with 5s. for the purchase of seeds, but "the person undertaking the cultivation may expend of his own money any additional amount which he pleases," and may also avail himself of the produce of the plot, if any. Vegetables must not be grown, "as the object of the cultivation is decorative." The sum of £20 will annually be distributed in prizes, which will be given for the best result on the line and the best result for men of each department. The special conditions and difficulties of each station will be taken into account in making the awards. The company is also desirous of making a display of evergreens and similar plants, in hanging baskets, etc., at underground stations, such as the Temple, and our contemporary is informed that it is prepared to receive offers from seedsmen and florists.

Botanical Congress at Brussels.—According to the provisional programme of the botanical congress that will be held at Brussels in May next, the members will arrive on the 14th of that month. On the following day they will be received by the Royal Botanical Society of Brussels at a special seance. The congress will commence at 10.30 a.m. on May 16, and will be continued until May 22. During this period excursions will be arranged to Antwerp, Ghent, the valley of the Meuse, Haarlem, and several other places. The subscriptions of the members of the congress is 15 francs (12s.), and for ladies who accompany their husbands to the congress 10 francs (8s.), and these amounts must be sent to the Secretary of the State Botanic Garden, Brussels.

R.H.S. Parks Examination.—The large number of men employed in the public parks in London and in the principal provincial towns, who presented themselves at the Horticultural Hall on the occasion of the annual examination, was so large as to show that the opportunity given them for having their knowledge tested is much appreciated. The examination, as in previous years, was held between 10 a.m. and 1 p.m., and the questions had to be answered in part on paper and part orally.

Yorkshire Gala and Floral Exhibition.—The schedule of the great gathering that will be held at York on June 15 and the two following days is before us, and, in glancing through its pages we have the best possible proof that the executive are fully alive to the desirability of maintaining the great excellency of the floral display. The classes are numerous, and the prizes liberal, and the exhibition should be at least equal to the magnificent displays that have been produced in previous years. The most important of the classes is perhaps that for a group of miscellaneous plants in and out of bloom, occupying a space not exceeding 300 square feet. In this the first prize is £20, the second £15, and the third £12. There is a second class for miscellaneous plants, and in this the space occupied must not exceed 200 square feet; and the four prizes amount to £3 An amount still larger is offered for a group of hardy herbaceous and perennial plants, which are to be naturally arranged. In this class the prizes amount to £4 Orchids receive liberal encouragement, as also do roses, carnations, begonias, gloxinias, and fruits, the most important of the classes for the last-named being for a decorated table, which is to be judged by points.

SWEET PEAS FOR EXHIBITION.

This subject is one which no doubt just now is under very serious consideration by gardeners, amateurs, and cottagers alike, and more so by the fact that the time is now drawing near for the spring sowing of these very beautiful flowers. Those who wish to grow them successfully, with the view of entering in good competitions, have several very important points to keep before them, and nothing must be left undone that will be conducive to the well-being of the plants from the very earliest stages The point of utmost importance is the preparation of the ground, and whether this is to be trenched in the autumn or spring is a matter to be decided by the individual on the spot. A good rule to follow is to trench light soils late in the autumn or early in the winter, and soils of a heavy and clayey nature any time from January till the end of February, but choose, if possible, a dry time for the work. If trenched earlier heavy soil is very apt to run together again very close under heavy rains, and thus necessitates the trouble of forking over perhaps two or three times before it is in any way fit to plant or sow in. Therefore, those who have not already prepared their ground would be well advised to proceed with it at once, whether the soil is light or heavy. Any kind of manure is useful for the enrichment of the soil, but where good cow manure can be had there is not much to surpass it, but I do not believe in it being put in the trenches in four or six-inch layers, but rather mix it well in each trench as the soil is turned over, and this, I am sure, induces a much better root action. With the top spit in heavy soils, or light for that matter, leaf-mould may be added with advantage, and it is surprising how freely the young roots will take to this, and a healthy and short-jointed growth result.

Sowing.

As before mentioned, the present is a very good time to make a spring sowing under glass, although, according to my experience, sowing late in the autumn is preferable, as, no matter how well one treats the spring-sown plants, they have not the same amount of root, nor are they as hardy as those raised in the autumn It is really a matter of no importance as to whether the seed is sown in pots or boxes. If the former, 48's or 32's are suitable sizes, if the latter the boxes may be twenty inches long, twelve inches wide, and five inches deep, and it is surprising how many strong plants can be raised in a box of this size. Not less important is the fact that the plants must be perfectly hardy by planting out time. Consequently, after the seeds are sown stand the pots or boxes on a shelf in a house, or near the glass in a frame, where the night temperature does not exceed 50 degrees. A little higher temperature from sunheat during the day may be allowed; sun will not hurt. Of course, a heated frame will do, but if very cold weather sets in, possibly immediately after germination has commenced, the chances are that many of the seeds may rot, and where they cost from one penny to sixpence each one must be careful. But if treated as advised, and given just a little warmth, then they should be quickly through the soil. Give plenty of air at this stage, and by the end of February they will be strong plants an inch or so high, and may with safety be removed to the cold frame, but if once they become attenuated all the care possible will not make them strong again. If in boxes they will fall about all over the place, and at the time of planting will require a stake or stakes to keep them off the ground. This is just what the cultivator should avoid, as plants raised in the spring should be able to stand upright without any support for three weeks.

Planting.

This is also a point of considerable importance, and I believe many people are rather later than they need be in putting their plants out. Providing they are two inches high, and thoroughly well hardened off, they can with safety be planted out any time after the middle of March. The soil must, of course, be in a suitable condition. If naturally heavy it may require forking over once or twice before it is fit to plant in, breaking it down as fine as possible.

Cultivators have their own particular ways of setting out their ground, but after trying several ways, I prefer now to plant in double rows. I allow five feet from centre to centre, but this might be increased with advantage to six, or even eight feet, but, the space at my command being very limited, I have to put them rather close together. If the rows run from east to west, then those varieties that require shade will only need it from one side.

In planting shake out each plant separately, with as little injury to the roots as possible, and arrange twelve inches apart each way, thus a row would be after this fashion:

. . . .

. . . .

A good hole should be made to allow of the roots being spread out carefully, and not with their points turning up, but all going downwards. Press the soil fairly firm, and make it very fine around the stem of the plant. Sprinkle soot around them, and then if covered over with a net to protect them from the birds they should not require much attention till they are so far advanced as to require staking, although it is wise, especially during a season like the past one, to keep them regularly dusted with soot to prevent the ravages of slugs.

A FINE TABLE OF SWEET PEAS OF THE SPENCER TYPE.
Shown by Mr. Silas Cole in competition for the W. Atlee Burpee Cup at the National Sweet Pea Society's Exhibition, 1909.

Staking and Thinning.

Whatever method is employed for staking the peas, it should be done well, as under the good cultivation that should be given them they attain a height that, a few years ago was unheard of. For exhibition purposes stakes standing nine feet out of the ground are none too high, and if the rows are of any length it is wise to tightly strain a wire the whole length of the rows on each side to steady them, fixing a post at either end to fasten the wires to. This should be done before the plants become very high, and if they break out well from the base they should be thinned out somewhat, and, if necessary, given a tie here and there to make the shoots more regular amongst the stakes.

From now every encouragement should be given the plants to induce them to make free growth. Hoe between the rows frequently, and if the weather sets in hot a good syringing overhead occasionally will keep the plants clean and healthy, but if the ground has been well prepared watering should not be necessary till the plants are well in bloom. On light soils it may be found necessary to give a good mulching, and possibly a soaking or two of water during June. But where peas are grown for exhibition these extra helps should be left, if possible, until just before the flowers are actually required, when a good mulching, watering, and manuring will be of immense assistance.

As mentioned before, if the ground has been carefully prepared, and well manured, heavy and continued doses of artificials will not be necessary, yet there are times when a little stimulant is needed, but it should be given in mild doses, or the colour of the flowers will fly. Either nitrate of soda, nitrate of potash, or sulphate of ammonia will do all that is necessary, using each at the rate of half-ounce to one gallon of water, and, say, a three-gallon can to every yard run of peas, and this is better given after a good soaking of clear water.

It is not necessary here to go into the subject of varieties; it is really not a matter of what we shall grow, but rather what we shall not grow, as the number and beauty of them are unlimited; so restrict, as far as possible, the number of varieties. Thomas Stevenson.

WINTER-FLOWERING SHRUBS.

It is astonishing, when one commences to reckon them up, how many shrubs there are which blossom during the early weeks of the year: in fact, it is often possible to find a greater number of shrubs in flower throughout the latter half of January than during the first fortnight in March. This is really a very good thing, for it serves to add interest to the shrubbery and woodland at what would otherwise be a dull and dreary time. With this in view, these early-flowering shrubs deserve encouragement, and every garden of anything like pretentious dimensions should contain them.

The laurustinus forces itself on one's notice by reason of its flattened heads of white flowers, which are set off to advantage against the dark evergreen foliage. As it grows into a shapely, handsome bush, it is useful alike for shrubberies and specimen plants. The various witch hazels are decidedly showy, and extremely interesting during January, the narrow curiously twisted golden petals having a weird spidery look. The twisted petals are found in the Japanese species Hamamelis arborea and H. japonica, whilst in the newer Chinese species, H. mollis, the twist gives place to a curved or hooked end to each petal. The flowers of all are fragrant, but those of H. mollis are deliciously scented. A near relative of the witch hazel is found in Parrotia persica, which is prominent in February, by reason of its profusion of bright red flowers, which, though small individually, are conspicuous because of their numbers. It is well worth a position.

Two honeysuckles favour us with flowers very early in the year. They are Lonicera fragrantissima and L. Standishi. The former bears white flowers, the latter cream blossoms. Both are very fragrant. Jasminum nudiflorum is rendered conspicuous in most neighbourhoods by its bright yellow blossoms, which are frequently at their best early in January. The "Winter Sweet," Chimonanthus fragrans, may be detected from a distance owing to its deliciously fragrant cream and brown flowers. Although often planted against a wall, it thrives excellently in the open shrubbery. A variety, known as grandiflora, is even more effective than the type, as the flowers are larger and golden in colour. Garrya elliptica is conspicuous during January by means of its catkins of yellowish-green flowers. For general effect the male form is far ahead of the female; in fact, the latter is only of value for its seeds. The male catkins are frequently five inches long.

Whilst speaking of catkins, the hazel nuts deserve a word of commendation, for when covered with their golden male inflorescenes, towards the end of January, they look very cheerful. A close inspection will reveal the bright red styles of the female flowers, which, however, cannot be said to be very conspicuous. Planted against a south wall Cydonia japonica may be expected to produce a few flowers during January, whilst in the open ground, should the weather prove mild, Prunus Davidiana may be found in flower early in February. A few years ago the writer remembers seeing a good-sized tree of this species in full bloom on January 22. The white form of P. Davidiana is even more showy than the type, its glistening flowers being very conspicuous on a sunny day. A couple of heaths are attractive throughout January and February, and flowers may have been found on them during December. These are the tall growing white flowered Erica lusitanica and the dwarf E. mediterranea hybrida. The winter-flowering form of the Mezereon, Daphne mezereum grandiflorum, has had a number of blossoms open during December, but it is during January that it is at its best, whilst as its flowers fade in February, those of the type and the white variety expand. In sheltered corners flowers may be observed on Rhododendron dauricum, the colour being reddish purple, and showy. Unfortunately, they can withstand a very small amount of frost, and are soon damaged.

Though not particularly showy, Nuttallia cerasiformis is worth consideration, for it blossoms early, and if the two sexes are planted together a crop of orange-red fruits is produced at a later period. The Cornelian cherry should find a place in shrubberies more frequently than it does at the present time, for its bright yellow flowers make it very showy in February, whilst its scarlet fruits later in the year add interest. It is also worth consideration for plantation work. To some people the name of Cornus mas may be more familiar. With this list to select from it may be readily seen that there needs be no dearth of flowers in the shrubbery during January and February. D.

SWEET PEAS IN PUBLIC PARKS.

Until recent years sweet peas were scantily employed in public parks and gardens, but owing to their popularity, which shows continuous increase, they are now in every open space in our cities and towns, represented upon a very large scale, much to the delight of the public generally. The very spacious borders and beds which exist in most parks, etc., lend themselves to their cultivation, and the production of imposing displays, and, happily, prominent positions are set apart for this purpose.

It is gratifying to know that sweet peas are less fastidious than many another subject with respect to pure air and clear atmosphere, and even in congested and manufacturing districts they do not fail to yield a good display of bloom, which is maintained for at least three months, while under more favourable conditions, where the parks and gardens are well outside the city or town area, their behaviour is identical to that in the country.

Experiments made by the writer with autumn and January sowings of the seeds went to show that it is inadvisable to commence operations until early in March in congested smoke-laden districts. It was found that the young plants suffer much from the combination of chemical impurities, smoke, and fogs, which militates against vegetation generally, and they failed to compare with the March-sown colonies in every respect.

Further, in view of the fact that stable manure and leaf-soil is invariably employed in public parks, I would advise that where the natural soil is light and porous cow manure be substituted, and on a liberal scale, and if a barrowload of loam is added to each site, or in the case of beds a four-inch layer be incorporated with the staple, all the better.

It is a significant fact that plants or colonies which receive overhead waterings in the early stages of their growth make vastly better progress and stronger growth than those that receive no attention in this way. This is most pronounced in town gardens and parks, and I am firmly convinced that it is a very important factor in the successful management of most subjects under these conditions. There is much to recommend the setting apart of a good stretch of border within eight or ten feet of the walk, and to arrange a fairly representative collection, including the very best and finest varieties, in large batches, with a prominent label so placed and written that the general public will experience no difficulty in learning the names. One often sees enthusiastic amateurs and others busily engaged in taking notes of the arrangements of plants and subjects that appeal to them in public parks, and I think everything should be done to facilitate matters, and thus encourage the practice of the gentle art. A word as to varieties most suitable for this purpose. It is true that for some reason or another varieties that are identical in growth and constitution vary considerably as regards their behaviour near towns, but the following can be recommended with full confidence as being satisfactory in every way: Queen Alexandra, Phenomena, White Spencer, Countess Spencer, King Edward VII., Queen of Spain, Unique, Othello, Mrs. George Higginson, Jun., Lord Nelson, Frank Dolby, Hon. Mrs. E. Kenyon, Black Knight, Lady Grisel Hamilton, Horace Wright, Dorothy Tennant, Prima Donna, and White Eagle.

Walter H. Aggett.

PLANTING SEASON.

By Appointment.

PAULS' ROYAL NURSERIES,

Waltham Cross, Herts,

Twelve miles from London; South entrance four minutes' walk from Waltham Cross Station (Great Eastern Railway); West entrance three minutes' walk from Tramway Terminus.

SPECIALITIES:

ROSES in all forms, from open ground and in pots. Roses in pots, both dwarfs and climbers, extra fine this season.

FRUIT TREES for the Orchard, Garden and Forcing House.

HARDY TREES, for Street, Park, and General Planting.

SHRUBS, Evergreen and Deciduous, for General Planting.

HARDY CLIMBING PLANTS for all purposes.

RHODODENDRONS, CAMELLIAS, and AZALEAS. Rhododendrons from loam, extra fine this season.

HERBACEOUS PLANTS in great variety.

BULBS and SEEDS, and all Garden Sundries.

Price Lists on application. Inspection Invited.

Upwards of 1,000 Gold Medals, First Prizes, and other Awards at leading Exhibitions during the past 50 years.

Sole Postal Address:—

WM. PAUL & SON,
WALTHAM CROSS, HERTS.
Rose Growers by Appointment to His Majesty the King.

Seeds

MONEYMAKER

10 to 18—and more—fruits in a cluster, fruits weighing 6 and 7 to the pound, and remarkably uniform. Colour a bright red, skin very thin, flesh deep, flavour delicious. The plant has a fine constitution; bears at nearly every joint, and ripens its fruits early. Well adapted for inside or outside cultivation. Spoken of enthusiastically by everyone who has grown it. Per pkt. 1/6.

TOMATO.

DICKSON & ROBINSON
THE King's Seedsmen
MANCHESTER

ORCHIDS. ORCHIDS.

Clean, healthy, well-grown Plants at reasonable prices. Many large specimens and rare varieties.

STOVE AND GREENHOUSE PLANTS OF ALL KINDS.

PLEASE WRITE FOR LIST.

Exotic Nursery, Cheltenham.

CLAY'S FERTILIZER FOR SWEET PEAS.

CLAY'S LONDON FERTILIZER
TRADE MARK.
Every Genuine Tin, Bag and Seal bears the above Trade Mark.

THIS PLANT FOOD OF RENOWN

Produces Blooms in Perfection and Profusion.

Sweet Pea Growers testify to its sterling value for the cultivation of the flowers they love.

It is Safe, Quick-acting, Reliable.

Clay's Fertilizer is used by the Leading Professional and Amateur Growers, by Government and Local Authorities, and by Horticulturists throughout the World.

It is unsurpassed for all Horticultural Purposes.

Sold everywhere in TINS at 6d. and 1/-; and in BRANDED and SEALED BAGS: 7-lbs., **2/6**; 14-lbs., **4/6**; 28-lbs., **7/6**; 56-lbs., **12/6**; 112-lbs., **20/-**. Or direct from the Works, Carriage Paid in the United Kingdom for Cash with Order (except 6d. Tins).

Full directions for use appear in the Fourth Edition of **CLAY'S SUCCESSFUL GARDENING**, the Horticultural Wonderbook, containing instructions upon all Gardening Topics by Eminent Writers, and including a contribution upon the **Culture of Sweet Peas,** by Mr. HORACE J. WRIGHT, F.R.H.S., the Chairman of Committee of the National Sweet Pea Society; comprehensive, informing, reliable, and up-to-date, 276 pages, illustrated, bound in cloth, NINEPENCE net, from all Seedsmen, etc., or Post Free for that amount from the Publishers.

PEDIGREE SWEET PEAS.

THE GREAT SECRET OF SUCCESS IN GROWING SWEET PEAS:— BUY WELL-RIPENED ENGLISH GROWN SEED FROM VIGOROUS PEDIGREE STOCKS.

The Paradise Sweet Peas were the *only ones* which lived through last winter in an open field. The *only* open air Sweet Peas shown at the Temple Show, May 25th, 1909. The *only ones* in the country from which a good crop of sun-ripened seed was harvested in July and August before the disastrous weather set in.

The Paradise Sweet Peas are noted for high germination, vigour, and purity of stock.

Save your money & buy direct from the Raiser & Grower.

The following are a few of my famous varieties:—
Evelyn Hemus, A.M., R.H.S.; A.M., N.S.P.S.; F.C.C., Woodbridge, and Silver Medal for the Best Novelty of the Year 1908. Zarina F.C.C. York; A.M., R.A.S., 1909. Helio Paradise, F.C.C. York, 1909. Charles Hemus, A.M., R.A.S., 1909. Crimson Paradise. Paradise Ivory, A.M., N.S.P.S. Trials, 1908. Paradise Carmine, A.M., R.H.S. Paradise Constance Oliver. Paradise Elsie Herbert, &c., &c.

APPLES FOR ORCHARDS.

After singing the praises of the paradise stock, and admitting all the virtues of bush trees worked on it, the standard is still indispensable, and a grass orchard is a useful adjunct to any establishment. We may go to our dwarf trees in the garden for our finest apples, and to the commercial fruit grower the system of bush culture may be the quickest way of making profits, but there is still a good deal to be said for the orchard. It is true standards are a longer time than bushes in coming into bearing, but when they do begin they go on indefinitely, each year the trees get bigger, and occupiers of orchards can testify to the weight of fruit, useful, if not up to exhibition form, that a fully-grown standard is capable of bearing in a good season. Again, standards do not occupy all the ground, the grass underneath is worth something for grazing purposes, and, considering what they produce, the trees demand little in the way of labour and attention. In short, it is not the object here to draw any comparison between standard and bush trees so much as to say a good word for the former, and in more than one establishment, while apples from the garden supply the dessert table, it is the orchard which provides for the requirements of the kitchen.

At this season of the year new orchards are being planted, old ones are being filled up, and the moment is opportune for saying a few words which may act as a guide to planters, and possibly prevent the making of mistakes. Any man who plants a standard tree does something for the future, and under the best of circumstances he must wait a few years before he gets any return for his outlay and labour. If after waiting the time specified he finds that he was all wrong at the beginning, and he has to start afresh, the position is, to say the least of it, disappointing, and how many people are there, I wonder, in the fruit growing world who would act differently if they could see their time over again?

When planting apple trees in orchards nothing is of greater importance than the selection of suitable varieties, and many people have lived to regret early mistakes under this heading. There are few districts in which varieties may be planted indiscriminately in orchards, and, therefore, care should be taken to choose only those which experience has proved are adapted for the purpose. If any man is advised to plant a variety of apple in his orchard as a standard which he knows nothing about, the first question he should ask is, "Will it grow?" In other words, has the variety got a good constitution, will the tree grow as a standard, make a good head, and look after itself? If there are doubts on this point the best plan is to have nothing to do with the variety, because in orchard fruit culture more failures have been brought about by planting varieties that had no business to be there than anything else.

But a novice might ask, how am I to tell the varieties that will grow? If he resides in an orchard district he might do worse than ascertain which varieties are doing best in the neighbourhood and, failing that, he should seek the advice of an expert. To select apples merely from catalogue descriptions is not good enough for orchard planting, nor is it wise to decide what varieties shall be planted from specimens at a show. Will the tree grow, should be the watchword: and now let us discriminate. There are apples in cultivation which are unsurpassed for certain methods of culture but almost useless for others. Take Lane's Prince Albert, for instance, which is admittedly one of the finest apples grown for a garden or plantation, but I have never seen it a complete success in an orchard, and the reason is that it will not grow. This variety is a heavy fruiter, it produces fruit buds freely, but it is at the expense of growth, and it does not get away and make a good head. If anyone wishes to prove this let him plant Lane's Prince Albert and Bramley's Seedling side by side in an orchard, and wait ten years. At the end of the period the latter will be a fine spreading tree, and the former not much bigger than when it was planted. Stirling Castle is another of the non-growing fraternity when planted in an orchard, and others might be mentioned, but the above are notable examples of the varieties to avoid.

Will it canker? is another question that the orchard planter would do well to ask himself. I know, of course, that all varieties are prone to canker under certain conditions, but some are great offenders in this respect, and should be strictly avoided if soil and situation are not ideal. In many an orchard to-day are to be seen mere relics of trees of Lord Suffield, Wellington, and others of the cankerous type, which were planted without consideration of their one weakness, and at the time when they ought to be large and profitable they are mere derelicts, and a discredit to the orchard. One might discuss cures for canker, but prevention is the best remedy, and it should take the shape of shunning varieties that are prone to it.

Having said so much about what not to plant, the next question is what should be planted, and, happily, there is no lack of varieties to select from. The object of this article is not to give long lists, because it is well known that apples have their likes and dislikes in regard to locality, but the varieties I suggest for orchard planting are those which combine cropping and growing powers, and the following may be taken as examples: Ecklinville Seedling, one of the best September apples we have; Bismarck, Gascoyne's Scarlet, and Warner's King (though this displays the canker weakness in some places), Beauty of Kent, Annie Elizabeth, Newton Wonder, and Bramley's Seedling, the last two being perhaps the best pair of orchard apples in cultivation. Thousands of Bramleys and Newton Wonders have been planted in orchards during the past few years, and they illustrate to the letter the class of variety that is best adapted for this purpose.

It is perhaps, however, in the selection of dessert varieties that the orchard planter is faced with the most difficulty, because, as a whole, they lack the vigour of the culinary section. If there were no points to consider everyone would, of course, plant Cox's Orange Pippin in the orchard, but I would say, hesitate unless the conditions are first class, and to plant Ribston Pippin in many orchards would be the height of folly. Worcester Pearmain, brightest and most profitable of early apples, is a weakly grower as a standard, and it wants everything in its favour to make a good standard tree. Beauty of Bath, the old Devonshire Quarrenden, and Mr. Gladstone, the weakness of which is the softness of the fruit, are useful apples for orchards, and to succeed them we have Allington Pippin, which has more vigour than Cox's, King of the Pippins, Duchess's Favourite, small but reliable, and, I might add, Tewkesbury Baron, a red-cheeked apple of fair quality that is grown in the West of England. The evidence of thousands of old trees still in existence proves that the place for Blenheim Pippin is in an orchard, and in selection some people would put Blenheim first and the rest anywhere. This, however, is prejudice on the side of the old favourite, which is a long time coming into bearing, and I seem to fancy that as an apple Blenheim Pippin has deteriorated in late years. Court Pendu Plat, Christmas Pearmain, Allen's Everlasting, Hormead Pearmain, and Wyken Pippin are good types of late apples that will grow as orchard standards, if the conditions are reasonably favourable. In all cases, of course, there follows the necessary attention in details of planting, protecting, pruning, and feeding, details, by the way, which in too many cases are neglected where orchard trees are concerned; but, nevertheless, the rule laid down in this article respecting the establishment of young orchards, and the renovation of old ones, stands good, i.e., plant trees that will grow.

H.

THE AMERICAN SWEET PEA BOOM.

Everything that is anything is boomed in America, and as sweet peas are looming pretty large in these enlightened days they have been subjected to the inevitable, and with the usual result.

Readers of the Sweet Pea Number of the **Gardeners' Magazine** will naturally inquire how the boom originated, and the object of the present article is to answer the question as fully as the available information permits. So far as the writer is able to learn, there is good reason for believing that its origin was the interest taken by British gardeners who had settled in the Eastern States, particularly Massachusetts, in the important work of Henry Eckford.

Many of these worthies hailed from the Land o' Cakes, and naturally took a sympathetic interest in the achievements of a "brither Scot." The enlightened and important Scotch element in the seed trade of Boston, the centre of the movement, was not slow to take advantage of the opportunity thus presented to foster the culture and love of this beautiful flower, and, incidentally, of course, gather in the shekels at the same time. The horticultural societies did all in their power to develop the interest thus aroused, and the comparative ease with which they could be grown soon filled New England with enthusiasts, and thus started the boom.

Amongst the earliest and most wholehearted of the devotees at the sweet pea shrine was the Rev. W. T. Hutchins, who was located at that time at Indian Orchard, Mass. A fluent speaker, and a prolific writer, full of energy and zeal, his glowing descriptions of the beauty of the flower, and practical demonstrations of its adaptability to the New England climate, soon found their way into the most widely circulated journals and magazines in the Yankee States.

As only a paltry 300 miles separate Boston and New York, the leading seed firms in the Empire City were soon close upon the heels of their confrères in the modern Athens, and the contagion soon spread to the city of brotherly love. Mr. Burpee having satisfied himself that the sweet pea was "all right," by submitting it to severe and practical tests on his Fordhook Farm, with characteristic foresight enlisted the practical sympathy and aid of the Rev. W. T. Hutchins, and from this point the success of the sweet pea boom was assured.

For a time the principal source of supply was Europe, and particularly England, but as the possibilities of California as a seed growing centre were becoming more widely recognised every day, experiments were made with sweet peas, and the result of the culture is known to us all, it having been demonstrated that some of the best sweet pea seed in the world could be produced in that glorious climate.

As the cheap Chinese labour was available, and the crop, at prices then ruling, was extremely profitable, the growers quickly lost their heads, and the market was soon glutted with a huge surplus, which, in the main, had not been cultivated with much regard to quality or purity of stock. As the American market was then practically closed to European growers, save for stock seed of the latest novelties, the culture on this side was naturally curtailed, and as the California growers did not care to continue a culture which threatened to become unprofitable, it appeared, for a time, as if there would be a sweet pea famine, but this was prevented by the intelligent action of Morse, Rohnert, and the Sunset Company, who resolutely set themselves to remove the existing reproach which rested on the quality of California-grown seed, and, by winning back the confidence of the buyers, obtain a price which would enable them to grow it at a profit.

The unfortunate seasons which European growers have experienced since that time have been all in favour of the Californian grower, who has once again contracted the sweet pea fever, and, but for the European failure, would have been heavily overloaded once more. Nearly 1,000 acres in different parts of that vast country were devoted to this crop last year, and so abundant has been the harvest that some of the large commission houses have been able to obtain their supplies at less than half the contract prices. This will, it is to be hoped, check the wild speculation referred to, and place the culture on a sound, profitable, and honourable basis.

As regards the culture of the sweet pea in America, by the Americans in their own private gardens, I am pleased to be able to report that it is still going strong. The good work done by the N.S.P.S. in this country is being taken up in America, and a National Sweet Pea Society has been established in New York State, which will carry on the good work initiated in London.

Very interesting testimony to the enthusiastic cultivation of the flower will be found in my article on "A Sweet Pea Carnival," which appears in the N.S.P.S. "Annual" for the present year; doubtless similar conditions obtain in many other places. All this goes to prove that in these days, at any rate, the sweet pea is not

"A flower born to blush unseen,
And waste its sweetness on the desert air."

S. B. Dicks.

SWEET PEA DORIS USHER.
A charming variety; colour, bright pink on a cream-coloured ground; raised by Mr. A. E. Usher.

NEW SWEET PEAS FOR 1910.

We have just left behind us the most deplorable of years, from the general standpoint of the seedsman who deals largely in sweet pea novelties, however good many of the newer introductions may eventually prove to be. We may safely say that more trying climatic influences than those of last season they are not likely to encounter. However, the season of 1909 has taught us a few lessons that we shall do well to bear in mind, and doubtless many raisers will be testing for themselves various cultural methods whereby they may be the more assured of obtaining the greatest quantity of good seed for distribution. Even the raiser of improved forms of sweet peas likes to be able to diffuse their charms over the largest possible area, and thus we feel with the reawakening of another season before us that we are again on the up grade, and that we have something in embryo to encourage us, and stimulate our anticipations until the arrival of another flowering season.

New sweet peas for 1910. Yes; there are some quite distinct from the already large number now in commerce, and some few are not only distinct, but desirable additions to the existing army. Then there are others of very great refinement, possessing the finest qualities in given shades; their names are legion, their differences not so pronounced, only as cultural science is applied or lacking; in either case this means much to the flowers grown.

Amongst varieties recognised during the past season Mrs. W. J. Unwin was one of the most pronounced, and although a flaked pea, it is a decided gain, and correctly described as a white ground artistically flaked with the orange-scarlet of St. George. The pea appeared to have a good constitution, and produces a very pleasing effect growing. There are one or two others similar in colour to this pea; they, however, lack the size and general appearance of the variety named, which received the A.M. of the N.S.P. Society.

Another distinct variety thus honoured was Charles Foster. Nothing quite like this pea had previously been seen: it is a tinted cream or "pastel pink" shade, and possesses a satiny blush tint that is to be found in one of our best godetias: Mr. R. Bolton is the raiser. It is a strong, healthy growing pea, with a distinct and pleasing effect; its future will be watched with interest, as everyone is not agreed as to whether the colour will be popular or not.

Mr. C. W. Breadmore's pea, named Dazzler, is a very bright colour, and those in search of a really splendid St. George must have this variety. The stock is very fine, and for the type very free in growth. Edna Unwin, of which a coloured plate is given with this issue, is also a fine pea, with very bright flowers, and the remarks about Dazzler are almost applicable to it.

Mrs. Townsend was staged in good form at the Holland House Show, and received the R.H.S. A.M. The pea was largely shown last year, and is best described as a good Phenomenal; it throws a very delicate variety, named Mrs. Cawthorne, which is also worth notice. The true Mrs. Townsend is very pretty, and when the blue colouring is defined, mostly to the outer edge of the flower, its effect is charming. Another variety herewith illustrated, that was recognised at the same meeting, is Doris Usher. I have seen this variety in exhibition stands only, but on several occasions. Whether it is cultural science, or the variety, or both, there is something very marked about this flower, and my several descriptions made are to the effect that it is a cream ground Audrey Crier, and, as I have seen it shown, a most lovely flower. I have descriptions of others that come in the vicinity of the one named. Gladys Burt is one, Mrs. R. Hallam another. Lancashire Pink and Mrs. Watson are also most striking in this colour. Then again Mrs. Henry Bell Improved, now named Mrs. Hugh Dickson, is a very beautiful stock of a cream ground pea with a pink flush. An A.M. from the National Sweet Pea Society stamps it as a fine thing in the cream-pink section. A vigorous and floriferous type that should be included in the smallest collection grown.

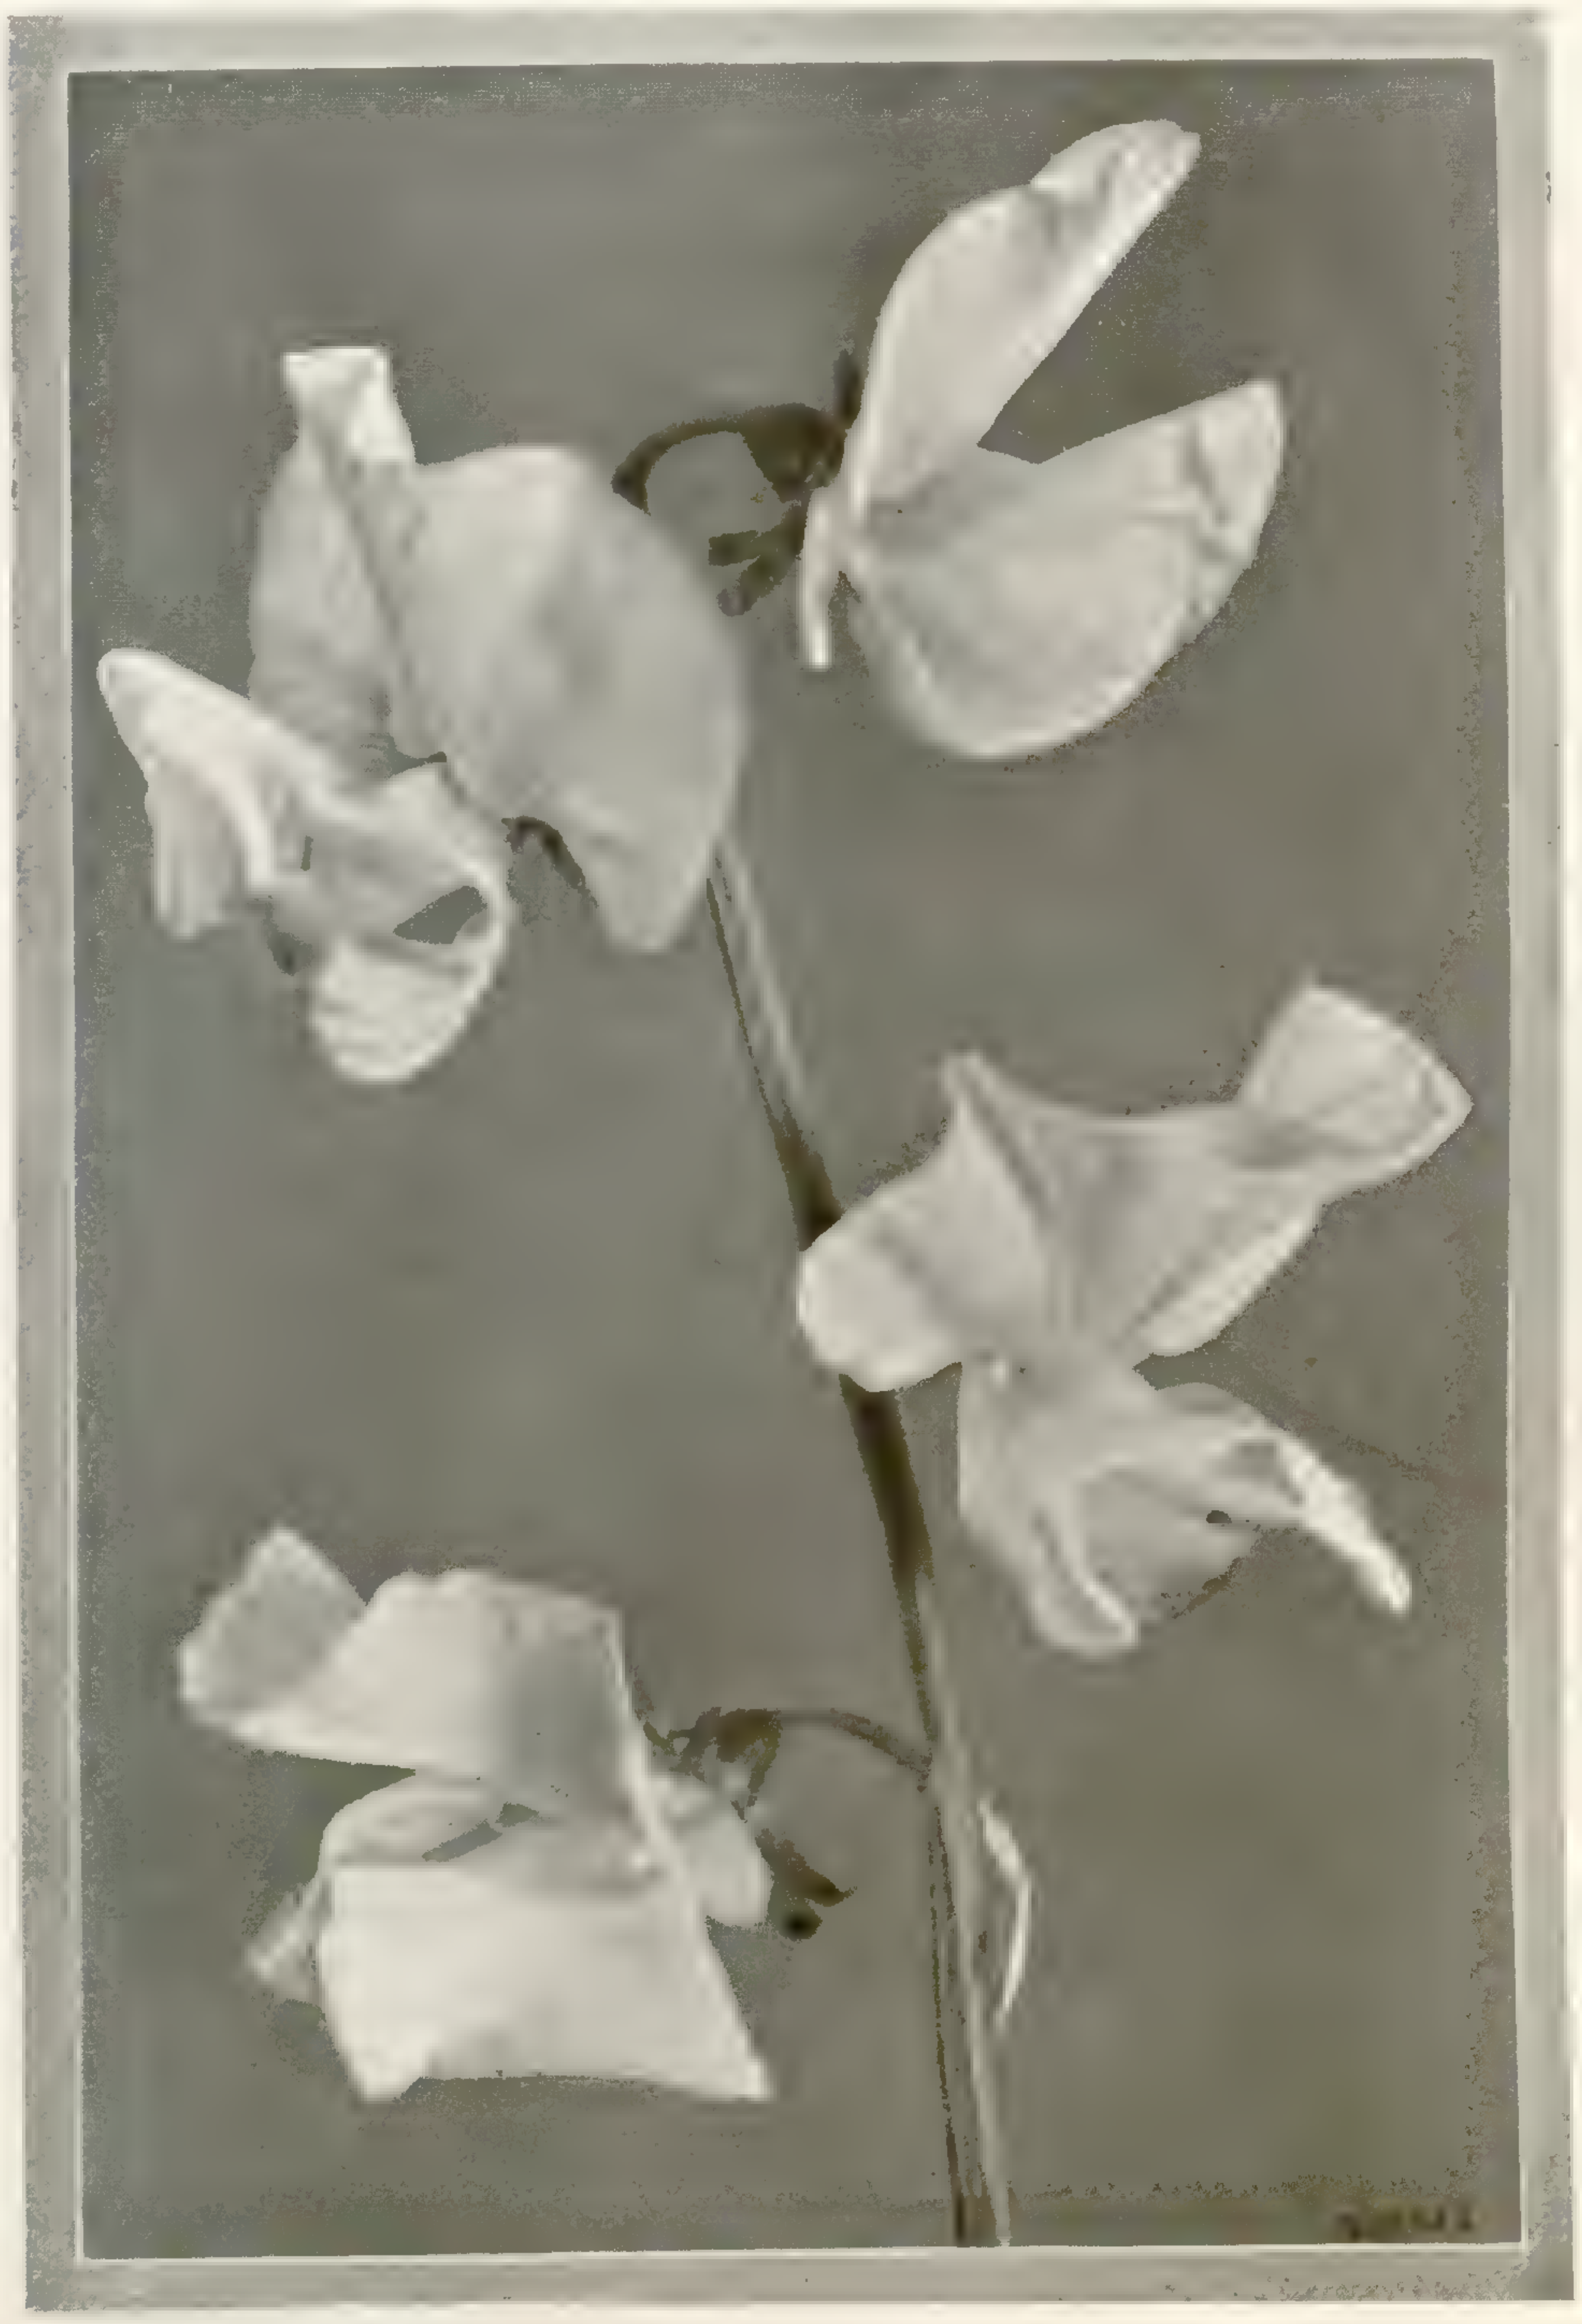
True stocks of lavender-coloured peas have been slow in coming; however, patience is rewarded with Masterpiece from over the border, and most beautiful it is when seen at its best; indeed, like some other colours, there appears a general tendency to fixity in lavender shades, and careful selection and building up from the right type are now assuming definite shape, so that good stocks are more plentiful in this slightly variable class. Frank Unwin, Lavender George Herbert, Asta Ohn, and Mrs. E. Noakes are some of the more recent names added to this Mrs. Charles Foster section. At the National Show, the Temple, Holland House, and other large exhibitions lavenders were in excellent form, and the variety illustrated, Masterpiece, is one of the best.

Very fine primrose waved stocks that are true are not uncommon now. Since the advent of Bolton's Clara Curtis sweet peas have gained much, there being no better or freer flowering peas grown, and the F.C.C. awarded has been verified since the original award was made. Good constitution, with free growth and abundance of flowers, marks this colour. Unwin, Deal, Dobbie, and others have fine stocks, and I have seen Deal's Giant Primrose and Breadmore's Princess Juliana finely shown, but Clara Curtis, in this section, stands first. For garden decoration Colleen is offered by Mr. Deal, it is a pea that will please most people, being charmingly light and pretty. It is one of the varieties recommended by the N.S.P. Society for the garden, and when well grown is a good exhibitor's variety for including in larger collections.

No sooner has The King had time to settle into steady ways than we are confronted with others, amongst which Dobbie's Sunproof Crimson received the N.S.P. Society's A.M. This is a fine type of The King, said not to disfigure by sun heat. There are other very fine Spencer stocks of The King, and there is nothing finer than this variety in its best form. Possibly it is more vigorous than any other sweet pea grown.

Edrom Beauty, A.M., is a very effective pea, and a row in full beauty is not easily forgotten: similar in colour to Helen Lewis, but with less orange, and a pronounced cream keel, a very true and uniform shade of colour that appeals to all who see it.

Queen of Spain, in Spencer form, is being carefully guarded. Mercia is a fine stock, and is specially recommended to market growers. Zarina, from Miss Hemus, and Queen of Spain Spencer, from Messrs. Dobbie, were most telling at Holland Park Show, the dark stem and pedicle harmonising splendidly with the salmon and pink-coloured flowers, a very free-flowering type, with wiry growth and dwarf habit. No collection would be complete without this section.



SWEET PEA MASTERPIECE.
A beautiful bright lavender-blue self, raised by Messrs. Dobbie and Co.

Amongst white flowers we have a plain standard variety in Blanche Stevens; its purity of colour is its greatest feature, and for market growers it may prove a good thing. Mr. Jones, of Lewisham, thinks highly of it, and with further selection to improve the setting of the flowers upon the stem it would, when known, be largely grown. Stark's White, now named Florence Wright, is a very vigorous grower, and throws some fine distinct flowers, the variety, however, is not quite constant in the type of flower produced.

Earl Spencer is now being distributed; it is a lovely shade of colour (and the best colour is only produced under artificial shade). Another variety, named Stirling Stent, is a fine acquisition, and Tortoiseshell, as seen at Shrewsbury, was exquisitely refined. Nancy Perkin is now offered, and also requires shade; it is a totally distinct colour, and not so bright as Earl Spencer. Orange King (Bide) is, if anything, brighter in colour than Stirling Stent, and is a plain-flowered variety: all of these must be given shade to preserve the colour. Some fine dark peas are now being offered. Gilbert's Countess of Ancaster, Gerhold's May Gerhold, House's Nubian, Unwin's Douglas Unwin, Burpee's Othello, and Breadmore's Prince of Asturias are all new and good. The varieties vary. Some are good chocolate selfs, others have a decided plum-purple shading, and others are maroon coloured; they are all healthy growers and fine exhibition varieties. Dorothy Tennant Spencer is a good Marquis type, with flowers very nicely placed, and Ida Townsend is a similar thing.

The waved scarlet George Stark may be relied upon to do credit to the raiser if there is plenty of sunshine. In its true character it is the finest pea of its class now being offered. A new pea that forms a good companion to the Queen of Spain Spencer forms is Gilbert's Cherry Ripe, a very beautiful pea, even more pleasing in colour than the old Coccinea. A little shade is necessary for this pea in unsteady weather. Chrissie Unwin is also a very pretty variety in this class.

Kathleen Macgowan was the first pea seen of the beautiful silvery sky-blue section. These are very pleasing additions, and are really more "Unwin" in form than "Spencer." The names are rapidly increasing, and include Anglican Blue, Flora Norton Spencer, Miss Philbrick Spencer, Zephyr, and others. These are all novelties, and one variety should be grown in every collection.

A good pea with heavy chocolate markings on a lighter dull ground is Senator Spencer; it is a very strong grower, and makes a distinct change that some like. Spencer Aurora is also a good pea, and Mrs. Wilcox; these make up three good distinct varieties. Of less vigour, but pretty, are Miss L. E. King, orange flake; Stark's Elegance, and Silver Wings, and are also useful.

Bolton's W. R. Beaver is very vigorous, and one of the best chocolate flaked peas.

C. Foster.

Sutton Green.

SWEET PEAS IN FLOWER BORDERS.

The addition of judiciously placed and well grown clumps of sweet peas in the herbaceous or annual flower border is a distinct gain, adding to the variety in colour as well as to quantity of bloom. In the ordinary herbaceous border there are periods in July and August when tall-flowering species are not over-plentiful, and these are the periods in which sweet peas will be a distinct gain. I need hardly say that the manner in which they are cultivated will determine the effect produced. For instance, if the sweet peas are so crowded with a vigorous patch of helianthus, Pyrethrum uliginosum, or Chrysanthemum maximum that the growth of the sweet peas is crippled for want of light, then the method of culture is at fault, and not the principle of combination. Again, the arrangement of colours will have much to do with the effect produced. For example, Dorothy Eckford sweet pea should not be planted close to a clump of Chrysanthemum maximum or Pyrethrum uliginosum, but one of King Edward VII. or George Stark would be more appropriate. Many more examples might be given, but that is purely a question of detail, and may well be left to the cultivator, after pointing out how desirable it is to arrange the colours that they will produce a harmonious whole. Sweet peas in the flower borders should be of decided colour to be effective, such as bright red, rose-pink, yellow, and white, rather than of a bicolor or striped type, as they are more easily made to harmonise with the surroundings.

SWEET PEA MRS. TOWNSEND.
An effective variety, flaked and shaded heliotrope-blue on a white ground; raised by Messrs. Jarman and Co.

The aim also should be to have a quantity of blossom in a mass for producing the desired effect, rather than having a limited number of exhibition flowers. With this end in view, instead of removing all the side shoots from the main stem, they should be encouraged to grow freely and vigorously. Many of these side growths will extend quite six feet in length in a season; such growths give an immense number of flowers, especially if the seed pods are removed directly the beauty of the blossoms is past.

The number of plants in each clump will depend upon the space at command. Six sweet pea plants, given abundant space, will make a handsome clump, especially if the haulm is early and carefully spread outside the supports, giving the main stems space to develop fully their lateral shoots.

The supports for the haulm should be thrust into the ground in a perpendicular manner, not sloped into the centre, as is much too common a practice even with edible peas; such a method robs the plants of light, air, and space, and if those who practice this method would but stop to think of its disadvantages I do not think they would continue it. The ordinary hazel or beech stakes make good supports, but have not such a pleasing appearance in the border as the tops of larch trees, with the side branches retained about eight inches long, to which the sweet pea tendrils readily cling. With a little time spent in training the plants to these larch supports a really effective clump can be had.

Sowing the seed in pots should be the invariable rule, because in the flower border the plants would be such a ready prey to slugs, which are so prevalent amongst the herbaceous plants, especially while the plants are so small, if sown in the open where they are to bloom. The early part of February is a good time to sow the seed in pots in an unheated frame. If three-inch pots are employed the plants should be transferred to six-inch pots later on to encourage a stout and otherwise vigorous growth. There is a natural tendency to draw the plants up rapidly amongst the taller herbaceous plants, and as anything like weakly growth is opposed to a profusion of flowers it should be guarded against.

The positions in the borders in which the plants are to grow should be carefully prepared in January by digging out the holes three feet deep, and adding manure freely.

After planting cover the surface with finely sifted coal ashes for a distance of six inches from the plants, as a means of warding off slug attacks. Sparrows also are troublesome, much more so among the border plants than in the open; black cotton is still the best plan of keeping these birds off: it should be wound around the supports.

Some few of the free-flowering Cupid sorts might be employed near the front of the border if space permits; they would be effective if planted on slightly raised mounds, with a few stones. Clumps a yard high or a trifle over might be introduced in suitable positions; these should be obtained by pinching the plants to induce dwarfness in growth; such plants hardly ever give quite the same wealth of blossom as those allowed to grow away uninterruptedly.

As to the varieties there is not much to say. Amongst pinks Audrey Crier, Countess Spencer, Gladys Unwin, and Mrs. Hardcastle Sykes are difficult to surpass. Dorothy Eckford and Etta Dyke are of great merit as white-flowering varieties. King Edward VII. and Queen Alexandra are especially to be recommended for effective colouring. George Herbert I look upon as quite one of the best of garden varieties; the colour is a rich rose-carmine. I think it more desirable than John Ingman. Clara Curtis, Queen Victoria, Harold, James Grieve, and Primrose Spencer are the most desirable of the so-called yellows. Amongst blue sorts Navy Blue, Frank Dolby, Lord Nelson, Marbled Blue, Mrs. Charles Foster, and Romolo Piazzani are desirable, embracing, as this selection does, various tints of blue. Of light colours Princess Victoria, Sutton's Queen, Mrs. Routzahn, Miss Hemus, Mrs. Henry Bell, and Constance Oliver are remarkably good. Orange-coloured varieties, like Henry Eckford, are liable to sun scorching in the open borders.

E. Molyneux.

Flowers of Foreign Growth were plentiful in British markets during 1909, as indicated by the fact that their value was returned as £244,855. These figures compare with £229,802 in 1908 and £233,802 in 1907.

SWEET PEAS FOR THE GARDEN.

Sweet peas are so largely grown in the gardens of all classes that there is no occasion to write much about their usefulness in adding to the attractions of the flower garden, or to refer at length to their value for the supply of an abundance of flowers for indoor decorations in a cut state. That they possess a high degree of utility for both purposes is beyond question, and sweet peas should not only have a place in the flower garden, but they should be grown to as high a degree of perfection as possible. With a view to assist those who have not had much experience, I will briefly describe the method of procedure by which an abundance of flowers of high quality are obtained in the gardens under my charge.

SWEET PEAS AS GROWN IN BRICKENDON GRANGE GARDENS.

To obtain good results in the cultivation of sweet peas, it is necessary to begin early, and thus give the plants time to become well rooted and strong before the flowering season arrives. My practice is to sow the seeds about the middle of February, but a few days either way is not a matter of great consequence. Pots four inches in diameter, and a substantial and moderately rich compost are used, and five seeds are put in each pot. The pots are placed in a warm greenhouse, and in this the seeds germinate within a short period. When the young plants are well above the surface, and are commencing to grow freely, they are removed to an unheated frame and placed within a short distance of the glass. The chief point is to encourage a firm short-jointed growth, and to keep them sufficiently hardy to permit of their being planted out towards the end of March.

While the plants are making progress under glass, the cultivator must give attention to the preparation of the borders or other positions in which it is intended to grow them during the spring and summer months, so that everything may be in readiness when the time comes for planting them out. It is generally acknowledged that a deep well-worked soil is the best for sweet peas, and, as I have in the course of my experience found this to be the case, I am careful to have the ground broken up to a depth of not less than two feet. A deep rich loam is the most suitable for sweet peas, but the best has to be done with the soil at command. It is advisable that it should contain a liberal proportion of calcareous matter, and in most cases a liberal dressing of lime or chalk should be incorporated in the process of preparation. A liberal application of manurial matter is also necessary, and my practice is to deeply trench the ground, and well work in plenty of farmyard manure at about a foot below the surface. Deep working of the soil is necessary to enable the roots to penetrate the soil to a depth that will place them beyond the influence of short periods of dry weather. They require plenty of moisture during the summer, and an application of liquid manure from the farmyard once a week will be found of great assistance in promoting a vigorous growth and the production of flowers of high quality. The soil is kept open on the surface by the occasional use of the hoe in dry weather, as the loose soil assists in checking evaporation in hot weather and enables the rain to readily pass down to the roots.

Here we grow the sweet peas in rows alongside the grass walks that intersect the kitchen and fruit garden, and one of the rows is illustrated from a photograph taken in the course of the past summer. The rows are made up with lengths of different varieties, and this method of arrangement has the advantage of producing a varied effect, and of facilitating the gathering of a quantity of flowers of any colour for indoor decoration, or of selecting the flowers required for making up an exhibition collection. It should be added that the peas should receive support at an early stage, and that the sticks used should be strong and stand six or seven feet above the surface.

The following varieties are of much merit, and will form an excellent selection for the garden. White, Dorothy Eckford, Nora Unwin, and Etta Dyke; yellow, Mrs. Collier; cream ground, tinted, Evelyn Hemus, Jeannie Gordon, and Paradise Ivory; delicate rose and blush pink, Countess Spencer and Mrs. Routzahn Spencer; pink shades, Miss Willmott, Constance Oliver and Agnes Johnson; red shades, Queen Alexandra, The King, King Edward VII., John Ingmans, Chrissie Unwin, and Helen Lewis; pale blue and mauve, Frank Dolby and Lady Grisel Hamilton; dark blue, Lord Nelson and Navy Blue; blue and purple-flaked, Prince Olaf and Helen Pierce; purple and maroon, Black Knight.

C. Cox.

Brickendon Grange Gardens.

A Swiss National Park.—It is reported, on what appears to be very good authority, that the project which has for its object the creation of a national park on the lines of the Yellowstone Park in the United States, to preserve the Swiss flora and fauna, has made sufficient progress to justify the hope that it will be brought to a successful issue. The offer of the Commune of Ternetz to let for the purpose a large tract of land in the Lower Engadine, at a nominal rental for twenty-five years, has been provisionally accepted. This tract of land contains primitive forests, and thickly wooded valleys, and as it is beyond the track of the tourist wild life is not likely to be disturbed.

THE DECORATIVE USES OF SWEET PEAS.

Unless I am much mistaken we shall all agree that the sweet pea is pre-eminently a decorative flower, and, by reason of its manysidedness, it lends itself most delightfully and artistically to all decorative purposes, as well as to the garden and the show board, and the development it has undergone since it celebrated its bicentenary at the Crystal Palace in 1900 (just ten years ago) speaks for itself. I remember being present on that memorable occasion as one of the chosen judges for the decorative classes, and there was a measured mile of sweet peas! and part of that wonderful mile was devoted to decorative classes. The National Sweet Pea Society is, I believe, the outcome of that grand exhibition, and since then the sweet pea has, as a decorative flower, held its place, second only to the rose. It is a universal favourite, the chosen of the dinner table, the basket, and the bowl, and largely used in bouquets, sprays, and buttonholes; it possesses a charm alike of fragrance and colour, is self-supporting, and lends itself to almost every form of decoration. And in this sceptical age, if any reader doubts the truth of this assertion, let him or her go to the National Sweet Pea Society's exhibition at Vincent Square, and become a convert; tables will meet the eye of every colour, yes, and every shade of colour, too. I think I am right in saying every tint and colour of the rainbow meets here, and brings with it a note of joy to the onlooker. The fact, too, of this flower being so easy of cultivation is a vast help, for it is with us all through the summer months.

With regard to dinner-table decorations, may I give a few hints to decorators. The colour and style of the dining-room or banqueting hall is a very powerful factor to reckon with, and must be duly considered in the scheme of decorating the tables. All light shades are better for artificial light; if the room be of oak panelling the palest colours should be employed, but where the decoration of the room is white, pale yellow, pale pink, or green, deeper shades may be used with advantage. Never attempt mauves or blues for artificial light, although for a luncheon table nothing can surpass them. Harmony of colour must ever be a foremost consideration.

Some few years ago, when sweet pea Edward VII. was a novelty, I remember seeing it to perfection at Holland House. Our beloved Queen Alexandra was going the round of the tents clad in silver-grey silk, and was presented with a magnificent bunch of the sweet pea called after our gracious King. Memory goes back, and revels in the exquisite harmony brought about by the silver-grey and crimson. Never crowd in arranging, nor use too many colours together; two or three shades of colour will be more effective, and harmonise better than a variety. For all kinds of decorations, viz., tables, bowls, baskets, vases, etc., remember that sweet peas never show to greater advantage than when they are in company with their own foliage. Nature knows best the green that suits them. Always strive after a light arrangement, and take Nature as your guide. The beautiful tendrils of the sweet pea lead us away captive, and recall that sweet and realistic verse of Keats:

"Here are sweet peas, on tip-toe for a flight,
With wings of gentle flush o'er delicate white,
And taper fingers, catching at all things
To bind them all about with tiny rings."

We ought to feel very grateful for the modern mode of growing this charming flower; the long stems of the present day lend themselves so delightfully for the artistic treatment that is meted out to them. White glass vases are preferable to coloured glass, the stalks showing through the pure water. The little air bubbles soon settle on them, and add their mite to the beauty of the picture. Our friend Keats tells us that the poetry of the earth is never dead, and, may I add, it never will be while the sweet pea holds its own.

H. C. Philbrick.

PROSPECTS OF THE N.S.P.S.

It is not for me to claim the rôle of prophet, indeed I have always disclaimed any special gift of prophecy, but one may in some measure judge the future by the past, because history is ever repeating itself. There is one great difficulty about this kind of judgment or prophecy, in that men may become wise enough to avoid the pitfalls of the past and prevent a repetition of floricultural disasters. They that are wise will heed these things.

Not yet has the sweet pea reached the zenith of its popularity, and personally I am in no hurry to see it do so. There is a great need for steadiness, both among our enthusiastic amateur growers, and the raisers and distributors of novelties. If the National Sweet Pea Society is, or becomes, strong enough, through the work of its committees, to exercise this steadying influence, then not only will the Sweet Pea Cult flourish in 1910, but for very many years to come.

The prospects of the National Sweet Pea Society are excellent, but the position in which the members of that body have placed me, is one in which sooner or later I hear of most things that happen in the sweet pea world, and so, while I am anything but a pessimist, I cannot shut my ears and eyes to the tendencies and influences that may presently defeat the best interests of the society, and the sweet pea industry. Right ought to be might, and to argue that certain things may be done with impunity because a society is not powerful enough to strike at the root of the matter, is to belittle the society, and—well, I suggest that it is possible to play too long on a volcano, the strength of which has not yet been gauged.

As the society continues to issue an "Annual," and to conduct independent trials, I feel sure its work will appeal more and more to the great body of sweet-pea lovers, and as these good people increase in number and attach themselves to the society so will their voice and power be heard and felt. The sweet pea is a flower for the million, not merely for the millionaire, indeed not only for the competitor. The beauty of the many lovely sweet peas that are never likely to figure on the show table is beginning to appeal to the multitude. Practically all sweet peas are good garden flowers, but they are not all up to exhibition standard, therefore the award of commendations for garden or market purposes is a step in the right direction and must make for increased membership.

The Sweet Pea Society has progressed so fast that expectations run high, and folks expect a floricultural Utopia at once. To these I would say join in and help us with your subscriptions, your influence, and your suggestions, so that the ideal may be reached as nearly and quickly as possible. I have just made from our list of members the final deletion of those who did not pay their subscriptions in 1909, and more than a hundred names had to be removed. To add two hundred and eighty members and lose one hundred and thirteen, means a net gain of a hundred and sixty-seven. I maintain that we ought to increase at the rate of two hundred and fifty per year, and I think we should do so if all our seedsmen were to push the claims of the society and do their best to secure new members. At present by far the greater number of new members are introduced by amateurs.

The conference held just after the annual meeting was a great success, and as it was a function I suggested, its success was pleasurable to me. The prospects for 1910 include one or more conferences dealing with sweet pea matters. The "outings," now so interesting and instructive a feature of the doings in any year, promise to be quite up to the standard of other years. The trials will be given more room this year than previously, and as they will be conducted at Guildford there will be a new centre to visit. How many varieties and stocks will be tested I cannot say at present, as the books have not yet been made up. America and France have sent many packets of seeds. What the exhibition of 1910 will be like I cannot possibly say, the Clerk of the Weather will have a good deal to do with it. We are trying a two-day show, and if arrangements can be made for filling up all the vases with water at the close of the first day, the flowers ought to last well enough, and so the show and the society will get, on the second day, the full advantage of the first day's advertisement. But if the flowers are badly faded on the second day I am afraid both the society and the traders will suffer.

The Floral Committee has no light task before it, but the members are fully alive to their responsibilities and are capable of the work they have to do. Registration, re-organisation of the colour classification, and regulation of nomenclature, are some questions that will be discussed this year, and a very important matter the society is taking in hand is the investigation of sweet pea diseases.

In the matter of officers and committee the prospects of the society are again excellent. Mr. N. N. Sherwood, V.M.H., has earned the presidency by his work in the past, and by the great influence for good his high position in the seed trade has enabled him to exert through his office as treasurer; and with Mr. Edward Sherwood now following his father on the "treasury bench," the financial soundness of the society is assured. Commander Humphery, R.N., chairman of committee, joins knowledge to enthusiasm, and is sure to add to the prestige of the society; he would like to see the sweet pea become the floral emblem of the British Empire.

Finally, nothing succeeds like success, but the greatest success in a society like ours is that which is brought about by the efforts of the many. Every member should make himself or herself responsible for the introduction of at least one new member this year, and then we should make a splendid advance. And, after all, our influence must be very small if we cannot persuade one other sweet-pea lover to join the National Sweet Pea Society.

Charles H. Curtis.

Brentford, Middlesex.

HARDY FLOWERS are always popular, as they make the garden bright and attractive, and require but little attention. All the information required for their successful culture is given in Easily Grown Hardy Perennials, by G. H. Vos. Price 5s. net, by post in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

PRESERVING CUT PERPETUAL CARNATIONS.

Precisely the best method of handling cut carnation blooms took the wholesale market grower years to find out. First one and then another idea was followed, until at the present time all large growers of cut flowers are agreed and practice the same method. I think it would be a distinct gain in the private establishment if some of the wholesale growers' methods were practised, that is, when large quantities of bloom are wanted for one special occasion. Too often the flowers are cut and taken direct from the greenhouse into one of the rooms, to do service without having been previously prepared for the ordeal.

All lovers of the perpetual-flowering carnation will realise how important a thing it is that the flowers should last well after being cut, so that all that is possible in the way of lasting capacity can be got out of them. Nothing is more appreciated by the recipient of a floral gift than that such gift should remain fresh for several days.

In a commercial establishment carnation flowers are always cut in a half-developed state. The flower is still in its youth, so that a slow development goes on for several days after it has been cut. The flowers are not broken off at a joint, but are cut with a sharp knife between the joints, this being considered a matter of no small importance, as it has been proved that the stem takes up water more readily when so cut. The cutting is also done in the early morning, while the air is cool and laden with moisture. The flower and stem is also more full of sap in these early hours than later. This view of the matter is quite common knowledge and generally understood, yet too often neglected.

The bloom shed is always an important department in an establishment where cut flowers are the staple commodity. A dark cellar, which stands at about 45 degrees as an average during the four seasons of the year, is almost ideal. Scrupulous cleanliness should be the keynote. The air should always be pure and sweet. Large earthenware vases are greatly to be preferred. They should hold some two gallons of water, and be of sufficient depth to allow the stems to be half submerged in the water, which should be changed every twenty four hours. The flowers should not be allowed to hang their heads over the sides, but stand up erect.

As soon as the flowers are cut in the early morning they should be taken direct to the bloom shed, and not be left out of water more than a few minutes. Remove several of the lower leaves and place two dozen blooms in each vase, not close together, but spread out, allowing them plenty of room, so that the outer petals do not touch. How long a carnation bloom should remain in water in the dark room greatly depends upon the time and season of the year. For instance, in the summer the flowers greatly benefit if cut when half open and left in water for fifty hours before being used. The petals are then much stiffer and last longer when exposed to full light and air. They also have a much clearer and brighter colour. In the winter time twenty-four to thirty-six hours is long enough. Some varieties improve in water much more than others. For instance, Victory gets quite one-third larger in water, while Aristocrat, owing to its hard, wiry stem, does not improve at all in water. Such matters are quickly learnt by the observant gardener.

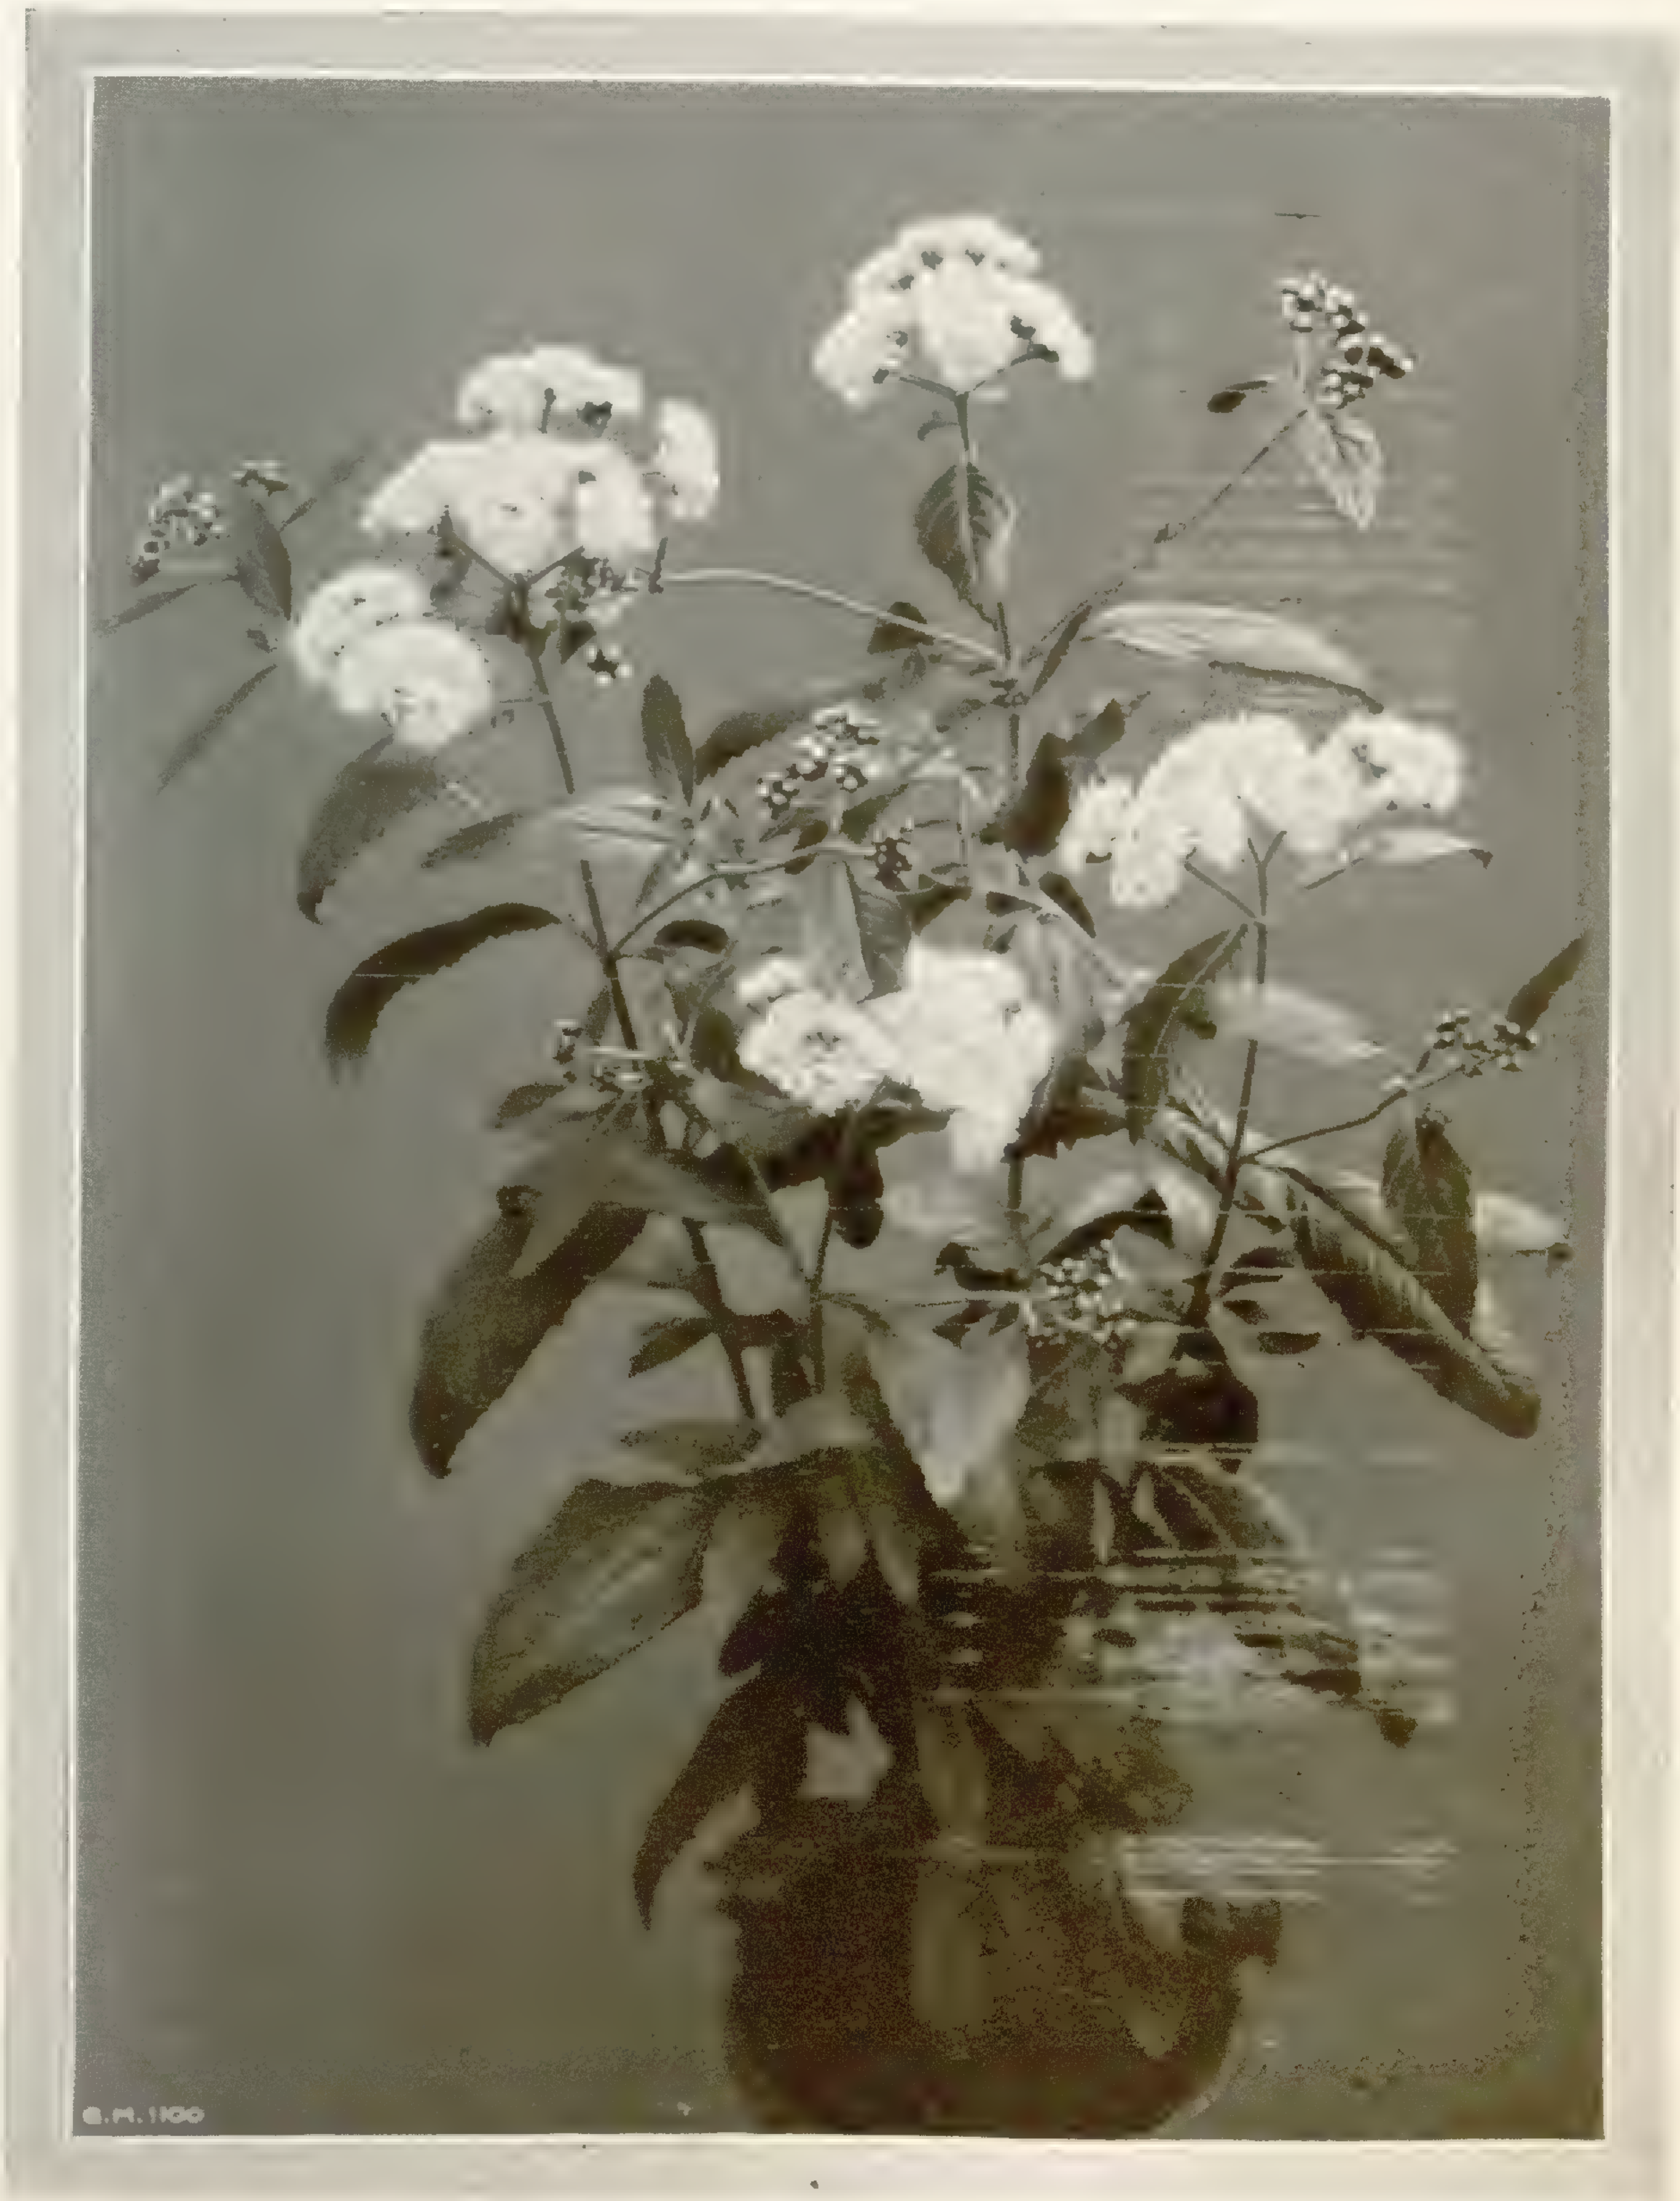
The large cut flower grower does not reserve his flowers for any special occasion by leaving them on the plant, but he cuts them as they arrive at the correct condition for cutting, placing them in his flower room where they keep fresher and last better.

I will venture the remark that all the best blooms at our leading perpetual-flowering carnation shows which carry off premier honours, have been cut from three to six days previous to the show. Carnation blooms which are cut in the afternoon upon a hot, bright, windy day, when plant and flower are in a somewhat flaccid state, cannot be expected to last long. If blooms are taken from a warm greenhouse and plunged into icy cold water they are sure to be affected by the sudden change, and their life shortened, and if taken from a cool greenhouse and suddenly placed in a room with a warm, dry atmosphere, they in like manner will feel the sudden change.

Few flowers last longer than the carnation if handled in a practical and reasonable way, but if the plants or flowers are exposed to sudden extremes it is unreasonable to expect the best results. Nothing is more beautiful than a fresh, fragrant flower, yet what can be more sordid, or depressive, than a wilted, half-dead specimen?

MONTAGU C. ALLWOOD.

Bush Hill Park.



ERLANGEA TOMENTOSA.

A useful new winter-flowering plant, somewhat like an eupatorium. Flower heads rosy-lilac, leaves fragrant. A.M., R.H.S., January 11. Messrs. James Veitch and Sons, Chelsea.

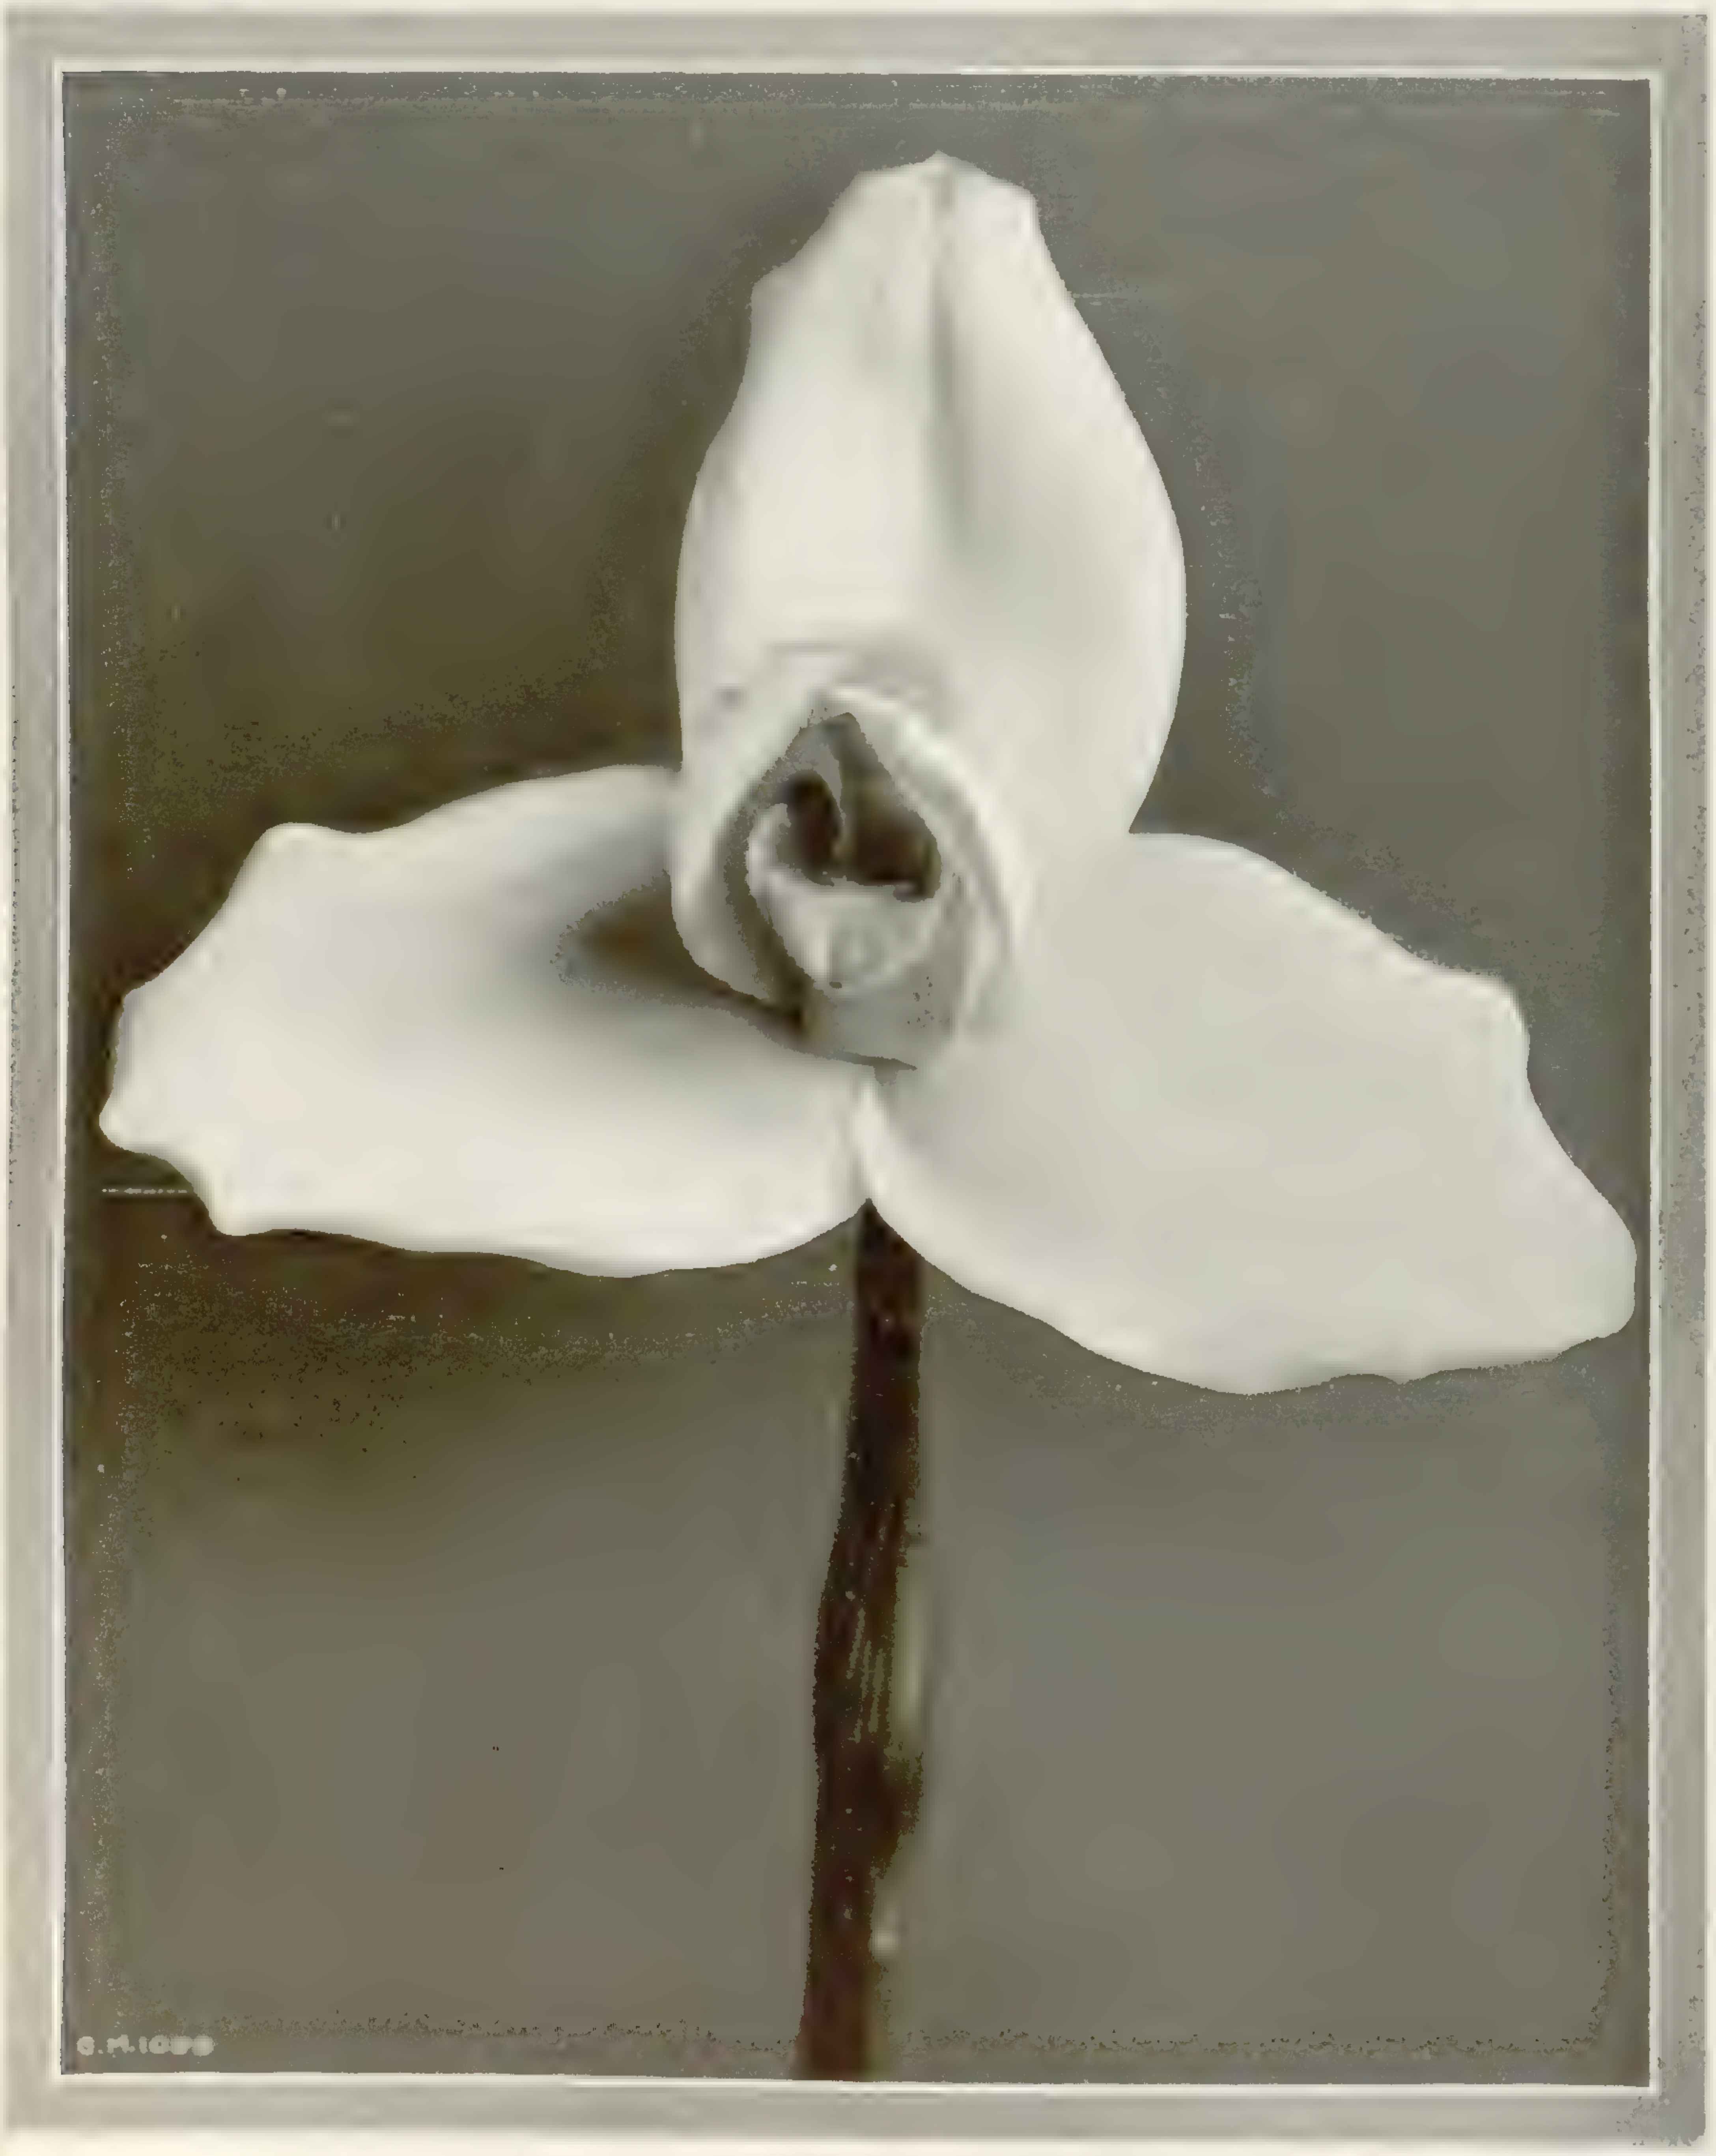
A NEW FLORAL HOBBY FOR PARSONS.

When reference is made to the hobbies of clergymen, it is sometimes thought by those who have had no experience of parochial work that they are not needed so much for purposes of refreshment and recreation as for helping to pass the time away in a pleasant manner. I am not disposed to speak harshly of those who regard the work of clergymen as very light, for not until one has had experience in the administration of a parish can a proper idea be had of the calls upon the time of those engaged in it, or of the trying nature of many of the duties that have to be performed. Of course, the work is more arduous in some parishes than in others, and the same amount of work will press more heavily upon one man than upon another, but, writing from, what the gardener loves so dearly, namely, practical knowledge, I am strongly of the opinion that the parson is wise who has a hobby.

A very considerable number of my brother clergymen have a hobby, and obtain much pleasure therefrom. Some devote attention to bees, and are able not only to supply their table with pure honey, but are able now and again to send a piece of comb or a small pot of honey to some parishioner in need of a simple delicacy. They are also able to show to their people how they might, with a few hives, obtain a good supply of honey at a small cost, and that, by enlarging their apiary they may augment their income by the products thereof. Beekeeping as a hobby has much to recommend it, but unfortunately there are many who, like myself, are not able to handle bees. While admitting that bees when handled properly seldom sting those who attend to their needs, the fact remains that some of us fail to understand how to manipulate them without making them angry, and suffer so severely as to compel us to have as little to do with bees as possible.

Not a few make a hobby of hardy fruit culture, and an excellent hobby it is, for when a fair measure of success is achieved the household supplies are greatly improved and materially increased, and much interest is derived from the carrying out of the various operations. It is not, however, the parson alone who derives pleasure from fruit growing. The influence of a well-managed rectory or vicarage garden is felt far beyond its boundaries. From what I have seen in various parts of the country I should be much surprised in visiting a clerical friend who has made a hobby of fruit growing not to find when walking round his parish a goodly number of excellent apple trees in the cottage gardens. The number of those who have hobbies that are useful as well as interesting is large, but unless I am much mistaken, not so large as those who have floral hobbies. There must be an immense number of parsons who make a hobby of roses, and so hard is it ridden by some that they consider it the only floral hobby worthy of the name. I so far respect their feelings as to feel that it would be unkind to question their judgment. Rose growing is a delightful hobby, so at least I have found it, and not the least pleasurable part of it has been the occasional bringing home of a first prize for a six or twelve that has been won in a keen contest for premier honours.

It is not my intention to ask one of my brother parsons to give up rose-growing as a hobby, but the time has come when it appears desirable to suggest the cultivation of sweet peas as a new hobby for parsons. One of its strongest recommendations is its suitability for those who have not the space, the time, or the inclination for engaging in beekeeping, fruit growing, or rose culture. The cultivation of sweet peas can be successfully carried out in the smallest of gardens, and without a very heavy tax on the time or the pocket of those who engage in it. Seed of really good varieties is cheap enough, even in a season following on a bad harvest, and the requirements of the plants are few. The soil has to be deeply dug and liberally manured, and the plants to be properly staked, and to have the dead flowers removed before the seed pods have time to impose a strain upon the plants. The return is an abundant supply of flowers of exquisite beauty for at least three months. Nothing could be more refreshing to the overwrought brain or the depressed spirit than to walk along one of the rows and enjoy the exquisite form, the charming tints, and the delightful fragrance of the myriads of flowers. This is not by any means all. Every room in the rectory or vicarage where flowers are admissable can be readily decorated with sweet peas, and few things would be more acceptable to parishioners on the sick list than a bunch of sweet peas. Then with the aid of the rows of sweet peas in his garden the parson can show how well suited they are for cottage gardens, and thereby encourage their more general cultivation among those whose resources as well as their gardens are very restricted. M. A.



LYCASTE SKINNERI ARMENIACA.

A beautiful white variety, with lemon-yellow lip. F.C.C., R.H.S., January 11. F. Menteith Ogilvie, Esq., The Shrubbery, Oxford.

NEW PLANTS, ETC.

LYCASTE SKINNERI ARMENIACA.

This beautiful and rare orchid was finely shown on January 11. The flowers are of fine form and substance, the broad sepals being pure white, the petals white, with lemon-yellow markings, and the lip lemon-yellow. Two plants were shown, and both were finely grown. F.C.C., R.H.S., January 11. F. Menteith Ogilvie, Esq. (gardener, Mr. Balmforth), The Shrubbery, Oxford.

CYPRIPEDIUM BANTAM.

A very interesting, beautiful, and distinct variety, obtained by crossing C. Sallieri Hyeanum with C. Euryades. It was figured in our previous issue. The dorsal sepal has a white apex, and the basal part is green very heavily and beautifully stained with deep, rich, burnished brown and purple-brown. Lip and petals are yellowish-green shaded with bright brown. A.M., R.H.S., January 11. Lieut.-Colonel G. L. Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester.

CYPRIPEDIUM ATLAS.

A very fine cypripedium, derived from C. Fascinator and C. insigne Harefield Hall. The flower is very large, and all the parts are broad and rounded. The dorsal sepal is white with a yellow-green base, spotted freely with deep purple. The yellow petals are shaded with purple-brown, and marked with a deeper shade. Lip, yellow shaded with purple-brown. A.M., R.H.S., January 11. Lieut.-Colonel G. L. Holford (grower, Mr. H. Alexander, Westonbirt, Gloucester.

ERLANGEA TOMENTOSA.

This new winter-flowering greenhouse plant has sweetly-scented leaves, and clusters of small rosy-lilac or mauve flowers, that very much resemble in form those of an eupatorium. The species is from Central Africa, and has been on view at Kew during the present and last winters. A.M., R.H.S., January 11. Messrs. James Veitch and Sons, Chelsea.

APPLE WILLIAM CRUMP.

This fine new apple, raised from Cox's Orange Pippin and Worcester Pearmain, gained an Award of Merit on December 22, 1908, and was described in our columns. It is a dessert variety of high merit. A.M., R.H.S., January 11. Mr. W. Crump, V.M.H., The Gardens, Madresfield Court, Malvern.

Phenomenal, white edging, violet purple	50	**2d.**
Constance Oliver, soft pink, suffused cream, a beautiful variety, Spencer	15	**6d.**
Queen of Spain, buff pink	50	**2d.**
Gladys French, light blue Helen Pierce...	15	**6d.**
Helen Pierce, blue and white marbled ...	50	**2d.**
Prince Olaf, blue stripe, white ground ...	50	**2d.**

SPECIAL Gold Medal Collection

The number of seeds in the following packets varies. The quantities are stated after each name.

	COLOURS.	
Helen Lewis (True)	Orange	20
John Ingman (True)	Rosy carmine	30
Countess Spencer (True)	Pink	40
Paradise Red Flake	(Red Flake)	30
Asta Ohn, Spencer	Lavender	20
Chrissie Unwin	Cerise	30
Bobby K.	Blush pink	30
A. J. Cook	Mauve	40
Nora Unwin	White	40
Flora Norton, Spencer ...	Blue	20
King Edward VII.	Crimson	40
Mrs. Collier	Primrose	40

With the exception of the two last varieties all are of the Spencer or Unwin Type.

PRICE.—2/6 the Collection, 12 varieties, or half the above quantities, 12 varieties, 1/6.
Finest Mixed, per oz., **6d.**; ¼ lb., **1/9**; **5/-** lb.

WALTER P. WRIGHT'S BOOK, "ALL ABOUT SWEET PEAS." The new standard work on this popular flower, thoroughly practical and interesting. Post free, [illegible]

Cash with order, and all orders carriage paid over 1/- in value. No order too small. For full description of these and other varieties, send for Catalogue. Post Free.

EXHIBITION ONIONS.

(Concluded from page 51.)

◆

Manurial Stimulants.

It is fatal to commence feeding the plants until they have become thoroughly established and have produced abundance of roots; similarly, much harm can be done to onions if feeding is continued too late in the autumn, when the roots, which are annual, have completed their season's work, as indicated by the tips of the leaves turning yellow. About the middle of June a sprinkling of finely powdered nitrate of soda or nitrate of potash (saltpetre) may be given, alternated with guano once a week in the quantities already recommended; this application should be given (whenever possible) just previous to a shower of rain, which readily washes a soluble manure like nitrate of soda into the ground. Last season, I substituted nitrate of lime for nitrate of soda with very satisfactory results. If the weather continues dry, these manures should be watered in.

I am not an advocate of the continuous watering of onions, as I have found from experience that if the ground between the plants is kept well hoed, better bulbs are produced than when the water pot is too freely used. I refer to a fairly retentive soil trenched to a depth of three feet. Liquid manure in the form of drainings from a manure heap, a pigstye, cowsheds, or stables are invaluable, but they must be used with care and judgment, and never given unless well diluted with rain water, the latter in preference to well water. Never water over the foliage with liquid manure. I once lost the greater part of a large bed of onions through carelessness in this respect; the foliage rotted off and the damp spread into the centre of each bulb. This was just previous to their ripening off.

Fungoid Diseases and Insect Pests.

Like all other highly cultivated plants, onions are attacked by diseases and insect pests, which often prevent their being cultivated on the same ground for a number of seasons. I once produced large bulbs from the same piece of ground for five years in succession, but had eventually to change to new ground owing to an attack of mildew, for which it is always well to keep a sharp look-out during the month of July. If taken in time, I find that there is nothing better to arrest the spread of mildew in onions than sulphide of potassium, using half an ounce to each gallon of water; light sprinklings of flowers of sulphur between the plants once a fortnight are also very effective. I have never experienced attacks of the onion maggot among transplanted onions; the absence of this pest may to some extent be due to the special preparation of the soil, accompanied by the dressings of lime and soot, together with the advanced growth of the plants at the time of planting.

Harvesting.

Onions badly harvested keep badly, and particularly so if over manured late in the season. Late manuring is also responsible for many of the bulbs becoming badly shaped and finally splitting, and also developing their flower spikes. If the period of natural ripening is prolonged through wet, unsettled weather, it may be necessary to assist nature by bending over the necks of the more robust plants; this will check growth and considerably hasten the resting period of the bulbs. In very wet soils it may also be necessary to partially lift the bulbs by means of the prong. In ordinary autumns the bulbs should be placed on the surface of the ground, bottom upwards, so as to thoroughly harden the under flesh and skin. Exposure in this way will also deprive the neck of its surplus moisture. Storing is best done in a well ventilated outhouse, the bulbs being either suspended by fastening string to their necks, or placing them on open shelves. If the rafters under the roof of the outhouse are sufficiently strong to bear the weight, there is no better place for winter storing.

Varieties to Grow.

The most popular variety for exhibition purposes is Ailsa Craig, yet it is an open secret that from a bed of Ailsa Craig it is possible to pick out quite a number of distinct types of onions resembling varieties such as Southampton Champion, Sutton's A1, and even Cranston's Excelsior. The latter I have found very useful for exhibition purposes, and it can be grown to quite as large dimensions as either Ailsa Craig or Southampton Champion.

SWEET PEAS IN SCOTLAND.

The wave of enthusiasm—shall we say—for the culture of the waved sweet pea is high, and points still higher for the future, in Scotland. High and low, rich and poor, grow their quota, and can it be wondered that they do so? The quality of the flowers is magnificent, owing to the plants having room to grow and develop properly.

Speaking broadly, prizes won at shows are the result of arrangement, rather than outstanding merit in the flowers. The growers are well up in nomenclature, and it is surprising to note the number who tell you truly the name of the variety in your buttonhole. That denotes keen observation and praiseworthy enthusiasm. We have some fun at times—oh, yes, the serious Scotch people are not altogether oblivious to humour. I remember showing a pink seedling to a batch of enthusiasts, when a worthy came up noted for his "knowledge." Asked by one of the party, "What is that?" he rubbed his hands, held it up critically, and, not to be had, with a long face, said, "It's no Black Knight, ony wey." Another, a Highlandman, who knew what he was talking about, when the best bunch in a show was under criticism, remarked, "I vote for Mrs. Skies." He meant "Mrs. Hardcastle Sykes," and wasn't far wrong in lauding her to the skies, was he?

The Scottish growers have learned the secret of success, viz., thin sowing or thin planting. New growers, acting on that advice, are almost certain of success, because they have fresh soil to work with, and the astonishing specimens obtained at the first attempt gives them a fever from which they do not very rapidly recover. I have seen some glorious groups grown on fresh soil without manure, and single plants grown in boxes, and well attended to that were nothing short of revelations even to experts. My friend, the Rev. MacDuff Simpson, of Edrom Manse, grew some in boxes last year for late blooms that would have won prizes anywhere. These were grown in quite ordinary soil, with no manure added. My friend had a show there last year non-competitive—which brought forth an extraordinary display. Why? because exhibitors who do not compete at shows turned up. One could not help regretting after seeing such a fine display that they do not compete. I never saw anything finer, and similar exhibitions—for charitable objects throughout the country, would give a further impetus to the possibilities of the sweet pea. In this district there are many growers whose flowers are of the highest quality. The soil varies greatly—still, all obtain grand results. In every case the rule is "ample room." There is an art, of course, in getting size and quality combined. I cannot warn growers enough, of the appearance at shows of great thick and long stemmed specimens, which have a faded, lustreless hue, when compared with the fresh and dainty specimens beside them. They are over the Border, too, and when judging along with my friend, Horace Wright, at a big English show, I was delighted when he passed such exhibits without remark.

In many of the gardens belonging to the landed proprietors the sweet peas are used for massing with grand effect. Those who have seen John Ness' sweet peas in Captain Aitken's garden at Nisbet, and Gideon Kerr's in Mrs. Baillie Hamilton's, at Langton, will not readily forget them. No disbudding, no thinning of laterals, and yet every spray fit for a show bench. Then again, you have them worked into the landscape gardening colour scheme, as at Floors Castle. I got a delightful colour shock when I visited the latter garden. They were grown quite differently from the two just named; the flowers were small in comparison, but what a sight. It was late in the season, and the eye caught great masses of Michaelmas daisies in the mid-distance of the picture, giving a subtle atmospheric effect. It was something new and charming. A combination of summer and autumn tints, yet in complete harmony. What will groups of Earl Spencer and Masterpiece look like against a background of prunus, or the Marquis acting as a background for montbretia, and so on? The possibilities are endless, and the scope for individuality abundant.

The Spencer type is dominant in Scotland—the old type—and what sweet pea grower does not look back with pleasure to its reign—is recessive. The newcomer proves that Scotland recognises and adopts improvements that are dainty and artistic in flower formation, and her competitors at shows have chosen, and chosen wisely, that Cole's Spencer type is their Queen.

The Scottish exhibitors at the great competitive gatherings have shown signs—especially at late autumn exhibitions—of a falling off in numbers, but a Scottish Sweet Pea Society is in embryo, and with such enthusiasts as Messrs. Frank Cuthbertson and T. McIlwrick cracking the egg, a healthy and vigorous chicken will be heatched, and this, perhaps, will develop equal to the N.S.P.S. itself.

It is hoped that numbers of employers who meantime prevent their gardeners exhibiting, will see their way to do so now. That is all that is needful to ensure success.

A. MALCOLM.

Town House, Duns.

Seed Sowing.—Active preparations must soon be made for the sowing of such seeds as auriculas, hardy primulas, and polyanthuses. They should be sown in shallow, well-drained boxes, or pans, and placed in a temperature of about 45 or 50 degrees, or even in a cold but sheltered frame. These seeds germinate slowly, hence a longer period is needed for their germination and subsequent growth if strong plants are required by the following autumn. On no account must the soil be allowed to become dry during the time the seeds are germinating, or the results will be disastrous.—W. HEDLEY WARREN.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

INSECT ENEMIES.—With a constant necessity for the use of artificial heat at this season of the year, every encouragement is afforded for the development of insect life; especially is this the case where the atmosphere is at all dry. A constant observance of the plants is necessary to prevent damage and disfigurement of the leaves by red spider, various kinds of thrips, and aphis. Such plants as cymbidiums, lycastes, phaius, dendrobiums, spathoglottis, bletias, sobralias, and others, with their evergreen foliage, are almost sure to become infested with red spider, at periods of the year when fire heat is at all excessive, or, for example, where the atmosphere is of a drying nature in any particular portion of the house. As soon as this pest is observed, the plants should be carefully sponged, as they quickly cause permanent disfigurement of the foliage, and should the conditions be favourable, the undersides as well as the tops of the leaves should be sprayed with some safe insecticide. Occasional fumigation will also keep these pests in check. Thrips are undoubtedly the worst enemy that the grower has to contend with, and nothing short of fumigating or vaporising and spraying at regular intervals will keep these pests in check. It is expensive, I am well aware; but the decrease in the time occupied in keeping the plants free from the unsightly disfigurement of foliage and growths more than compensates for the initial expense. The eggs of black thrips deposited on the undersides of the foliage in the autumn will be hatching out at this season, and where the thrips are found, search should be made to see that no traces of eggs are allowed to remain. Where they are discovered, carefully sponge all signs of deposit off. This sponging takes more than an ordinary wiping over the surface, so care must be observed to prevent scratching of the foliage. Where there is trouble with yellow thrips, which are such pests to cypripediums, I would recommend that the plants be dipped once or twice a week for three or four weeks. If winter-flowering cypripediums have been badly attacked, any repotting requirements should be postponed until the grower is satisfied that the pests have been destroyed. The plants will then be benefited by the new potting compost. Cypripediums should be sprayed with some safe and effective insecticide at least every alternate week throughout the year, excepting during the time the plants have their flowers expanded. Aphis or green fly are not difficult to keep in check. A very light fumigation with a safe nicotine preparation keeps these in check and effectually destroys any of the insects that are alive. The larval stage of the small black fly is passed in the potting compost of seedling orchids, and causes no end of trouble. The larvæ frequently eat out the node at the base of the developing growth, and are not discovered until the plants have been destroyed. The only relief I have found is from the vaporiser, and with the generations forming in the potting compost, it is a difficult matter to keep these in check, as only those on the wing and exposed are effectually destroyed. Cockroaches may be destroyed by poisons advocated for the purpose, or traps set about their haunts for their destruction.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CALLAS OR RICHARDIAS will now be growing freely, and they should have plenty of room and a free circulation of air about them. Supply with water in which sheep droppings have been steeped for a month at least.

FREESIAS that are unsupported should be attended to at once, placing four or five stakes in each pot and two strands of raffia round them to keep them upright. A shelf near the glass will be the best place for them.

KALANCHOE FLAMMEA.—The plants that were rooted last spring and were grown on in a cool frame throughout the summer will be developing their flower spikes, and should have a neat stake placed to them and be secured with raffia. Those coming into bloom should have the assistance of some artificial manure. If any shoots suitable for cuttings are noticed at the base of the plants secure them at once, using sandy soil for the cutting pots. When potting them off singly, use 4½-inch pots, with plenty of drainage, and as soon as they are growing freely place in a cool house till the weather be suitable for transferring them to a frame through the summer.

CINERARIAS.—Both stellate and large-flowering varieties will be fast coming into bloom. Supply with liquid manure three times weekly, and do not allow them to become dry. If green fly be seen, fumigate at once, otherwise the plants will soon be crippled and have an unsightly appearance.

HERBACEOUS CALCEOLARIAS.—Plants in 5-inch pots should be shifted into 8 or 9 inch pots. Use a compost consisting of good fibrous loam, sharp sand, leaf-mould, and horse droppings, and secure an efficient drainage so that the soil will not become sour. Keep them near the glass to prevent their becoming drawn, and on no account hasten the growth with artificial heat. On the other hand, keep in a cool house in which the temperature does not fall below 45 degrees.

GREVILLEA ROBUSTA AND EUCALYPTUS plants that are in small pots and have become pot-bound, should have a shift into larger pots. They will very soon begin to grow away freely. Water sparingly after potting until the roots obtain a firm hold of the fresh soil. Seeds of these subjects should be sown now to give the plants a long season in which to make their growth.

ROSES.—A batch of roses put into a warm greenhouse will start nicely into growth, but before taking them indoors give them a good wash. If a house can be exclusively devoted to grow roses, it will be an advantage. Roses just potted up are not of much value for flowering under glass, but if they were potted in the spring of 1909 and grown on they will be in every way suitable.—W. STAWARD, Belford Hall Gardens.

THE FLOWER GARDEN.

HELLEBORES.—Much as these dislike disturbance at the roots, they must at intervals be divided and new plantations made if the supply of finely developed flowers is to be maintained. This is necessary because the crowns become partly exhausted in the course of a few years. Much depends upon the treatment the plants receive, but they will amply repay the grower for the extra care and outlay when generously dealt with. When they have ceased flowering and the young growths are making their appearance is a good time to divide the roots; in doing this, do as little injury to them as possible, and plant at once in well manured and deeply dug ground. Under no consideration must the roots be allowed to lie about and become dry; this is only too frequently the cause of failure with imported clumps and crowns. In suitable situations the hellebores may be used as rock plants, the effect they produce being distinctly pretty, and welcome at a dull season of the year; but they require more frequent renewals than when grown in beds or borders.

VERBENAS that have been under cool treatment may now be removed into a temperature of 60 or 65 degrees of heat, to induce the plants to produce suitable growths for propagating. If possible they should be placed on a shelf near the glass; the result will be stronger and healthier cuttings. Detach the growths when about two inches in length, insert in sandy soil, or even clean silver sand, and plunge in bottom heat. For this purpose nothing answers better than a hotbed made up with equal parts of fresh stable manure and leaves, this mixture giving a steady, moist, and lasting heat. During the process of rooting keep the lights or pit as airtight as possible; if the cuttings are of a suitable kind roots will be emitted within a week or ten days, after which they must be removed into cooler quarters, or the pots withdrawn from the heated material, and air gradually admitted into the structure. At a subsequent date the plants must be potted off singly into 72 size pots, and finally into medium or large sized 60's. Under this treatment strong, healthy plants are obtained by the month of May.

GLADIOLI, DAHLIAS, CANNAS, BEGONIAS, and similar bulbs and roots must now be examined, and losses made good by division of the roots or rooting the growths, as the case may be, when the time arrives for these to be dealt with.

PENTSTEMONS, ANTIRRHINUMS, AND BEDDING CALCEOLARIAS raised from cuttings during the autumn, and still under cool treatment, should have their points removed to induce a bushy growth. These, at a later date, must be potted, or placed in boxes, as circumstances and space may allow. —W. HEDLEY WARREN, Aston Clinton Gardens.

HARDY FRUITS.

RASPBERRIES.—Where the work of pruning was not done as soon as the fruit was gathered, the old fruiting canes should be now cut away, and if trained to wires—which is preferable to stakes—the best placed fruiting canes should be selected, about six inches apart, and tied securely but loosely to the wires. If, on the other hand, they are grown to stakes, leave five or six good fruiting canes to each support. We always cut away the unripened tops of the canes as the tying and thinning is finished. The ground between raspberries should not be roughly dug over, but it will do no harm to lightly fork over the soil, not too near the base of the plants, then give a good dressing with decayed farmyard manure. Owing to the climatic conditions being all that could be desired in this locality for the past ten days, we have been busy planting raspberry canes, the soil having been previously well manured and trenched. Where such favourable conditions exist, planting should be proceeded forthwith. The canes should be planted in rows four feet apart, and fifteen inches asunder, and should be trained to stout wires, fixed to strong posts, running from end to end of the rows. We do not cut our canes down to within two feet, or less, of the ground, when newly planted, as many growers advise, only the unripened tops are cut off. This method has always been adopted here, and has given satisfaction.

MULCHING.—I do not recommend the practice of mulching established fruit trees in the open quarters and under walls at this season of the year; but if not already done, trees that were recently planted should be mulched at once with long stable litter, as far as the roots extend, to protect them from frosts. Do not on any account mulch trees when the ground is frozen, far better to wait until the frost has disappeared before proceeding with this work.

STAKING.—All newly planted trees should be firmly staked and securely tied, so that the trees are held in their proper position, and the roots are not strained with the wind. Good stout ash or larch stakes should be used for this purpose, using felt or sacking, so that the ligatures, or stakes, will not chafe against the bark of the trees. Many young fruit trees are practically ruined by indifferent staking and tight tying. Trees that were planted last year in exposed positions should have their stakes examined, and if decayed, these should be replaced with new ones, and carefully tied. Especially is this the case where espalier trees are trained to stakes. It is a good plan to cut away all the old ties on these trees, and renew them, after the stakes have been carefully examined.

GENERAL WORK.—The pruning of fruit trees and the preparation of the ground for planting, as advised in the last calendar, should be proceeded with, where the climatic conditions are favourable.—HENRY R. FARMER, Cardiff Castle Gardens.

BEES IN RELATION TO GARDENING.

At the second of the two meetings held by the Royal Horticultural Society, in August last, Mr. Walter F. Reid, F.I.C., F.C.S., vice-chairman of the British Beekeepers' Association, read a paper on the relation of bees to gardening, and, in view of the importance of the subject, we reproduce a portion of it from the society's "Journal." The paper was freely illustrated by lantern slides, and a considerable proportion of these have been reproduced for illustrating the paper:

Many of the greatest advances of modern science have been due to the recognition of the fact that even the minutest organisms and particles of matter are fully as worthy of detailed study as the grosser units that could alone be investigated before the invention of the microscope. The utility of such study has been abundantly demonstrated by the discovery of the bacterial origin of disease, and the isolation of radium, which has revolutionised our views of matter itself. Botanists were among the first to recognise the importance of the infinitely little; knowing how small a seed could produce even the largest tree they readily accepted the microscopic marvels that were listened to with incredulity by many of their contemporaries. The discovery of the fertilisation of flowers by means of pollen opened a new era for the horticulturist; but it is only since the classical researches of Mendel have been appreciated at their true value that the reign of law has succeeded to the reign of chance in the improvement of those products of the vegetable world that are necessary for our existence.

No sooner was it ascertained without doubt that pollen played a part in the production of some of our most important crops than a series of investigations into the methods of its distribution commenced, and these investigations are still by no means complete. It is established beyond doubt, especially through the patient researches of Darwin, not only that insects are concerned in the pollination of flowers, but that certain insects and flowers are adapted to each other in a most wonderful manner. He found that bees especially contributed very materially to the production of some of our most important crops; in fact, without their aid the seed would, in many cases, have been sown in vain.

While all kinds of bees are useful to the agriculturist, it is the hive bee in particular that is his greatest friend, yielding, as it does, useful products of its own in addition to its utility as a fertilising agent. That the beneficent action of these little workers was not sooner realised was due in a large measure to the erroneous belief which prevailed as to the nature of the substance which bees could be seen to collect from the flowers. Until the middle of the eighteenth century the little pellets of pollen which bees bring into the hive were mistaken for wax. It was not then known that wax was secreted by the bees themselves in glands specially adapted for that purpose. That bees generally visit the same kind of flower on each flight had not escaped notice. Aristotle was aware of the fact more than two thousand years ago; but the important bearing of this habit on the fertilisation of flowers has only recently been fully appreciated.

There are several ways in which the hive bee conveys the fertilising pollen from one flower to another, and, in considering these we must recollect that it is the worker bee only that visits flowers. Neither queen bee nor drones are ever seen on flowers; they are consumers of food and do not collect it. The organs of the worker bee are specially adapted for the work it has to perform, while the corresponding organs of the queen and drone are but partially developed. First in importance to the bee itself as a means of collecting pollen are the so-called pollen-baskets with which the hind legs are furnished. It is upon these that the bee brings home the pollen that is one of the ingredients of the food upon which it feeds its young. The hairs upon the body and legs are, however, the first instruments used in detaching the pollen from the flower. If you observe a bee issuing from a flower in which pollen is plentiful you will notice that it hovers for a moment in the air, and that its legs are in rapid motion. They are collecting the pollen grains from the body hairs and packing them upon that portion of the hind legs that is specially adapted to receive and retain them. But the bee cannot itself reach all parts of its body, and some pollen is sure to remain on the hair. The tongue of the bee is an organ of great importance from the point of view of the horticulturist, as it can convey pollen into flowers which are much too small to permit of the entrance of the insect itself. The tongue is even more densely clothed with hairs than the body, so that any pollen grains that may come into contact with it are caught and retained. Some flowers are visited by the bees for the pollen alone, especially in the spring, but, whether it come for pollen or honey, the bee cannot avoid carrying out the duties which the flower requires in return for the nutriment given.

The mutual advantages of this arrangement are very great. Where a plant is dependent upon the wind for fertilisation an enormous quantity of pollen has to be produced, with a corresponding strain upon the plant, and yet the fertilisation is so imperfect that in some cases, of which the date palm is a familiar instance, harvests cannot be relied upon without human assistance. It has been estimated that one maize plant will produce 50,000,000 grains of pollen. Compared with such figures the quantity of pollen that a single bee can carry may seem small; but the activity of the insect more than compensates for any deficiency in this direction. Estimates as to the number of blossoms a bee visits on each journey differ considerably; but there is little doubt that it may amount to several thousands.

While the pollen gathered by the bee is of primary importance to the flower itself the same does not appear to hold good with regard to the honey, which is certainly one source of attraction to bees. Some authors have considered that honey is secreted by flowers as a bribe for their useful visitors. But some plants, such as the laurel and the Jerusalem artichoke, have nectar glands upon their leaves, and these are frequented by bees and wasps without any apparent benefit to the plant. Although it is customary to speak of bees gathering honey from flowers, what they really collect is nectar, which differs both in chemical constitution and consistency from the honey that we get from the hive. The nectar extracted from the flowers is stored in a small bladder known as the honey sac, in which it is subjected to a preliminary process of concentration. On arrival at the hive the contents of the honey sac are ejected into a cell in which a further process of ripening and concentration takes place. Until the honey is so concentrated that it will not ferment the bees do not cap the cells over, and the beekeeper who extracts uncapped honey soon finds to his cost that he has still a lesson to learn from his bees.

Whether the hive bee visits flowers for honey or pollen it invariably encounters some device by means of which it is deprived of a sufficient quantity of the latter to fertilise the flower. I use the term hive bee advisedly, because the humble bee is less conscientious and often refuses to pay the price that the flower has the right to demand from it. Its powerful jaws enable it to bite through the corolla of a flower and thus to reach the nectary without coming into contact with the pollen. Darwin states that he has seen whole fields of red clover treated in this way, and that in the neighbourhood of Bournemouth he did not succeed in finding a single flower of Erica tetralix that had not been perforated. Such is the demoralising effect of the desire to acquire riches quickly that even the highly civilised hive bee will utilise the holes gnawed by the humble bee, and, where these abound, it will fly straight to them, without even looking at the proper entrance to the flower. Where humble bees are plentiful, gardeners will frequently notice the blossoms of scarlet runner beans perforated at their base, but I have not myself noticed any diminution in the crop of beans in such cases.

(To be continued.)

FLOWERS OF THE VAR VALLEY.

The Valley of the Var has been rightly described, observes the "Globe," as the metropolis of flowers. Bathed in the brilliant sunshine of the Riviera and Provence, the climate is eminently suitable for their culture, and acres of jasmine, violets, roses, orange, and other flowers, scent the air with their delicious fragrance. For seven months out of the twelve, the flower farms of Nice, Cannes, and Grasse produce enormous quantities of flowers, which are principally used in the Grasse distilleries, where they are made into scents. The traffic in cut flowers is also so great that the market gardeners and florists of Cannes and the neighbourhood dispatch nearly four hundred tons of cut flowers during the spring and summer months to different parts of Europe.

The season begins with the double Parma violets in January. They were planted in October in long furrows under the shade of the olive, citron, and lemon trees, to protect them from the heat of the sun. In November dots of colour appear among the leaves; the green is gradually overpowered, till in December, the whole plantation bursts into a glorious sheet of vivid blue. The blossoms are picked twice a week, for they lose their fragrance if allowed to remain long on the plant. Scents are sold so cheaply in these days, that it will come as a surprise to some people to learn that the essential oils of some of the commonest plants nearly touch the price of radium. Pure essence of violets is quoted by some of the Grasse distillers at over a hundred and twelve pounds an ounce; thirty-three tons of fresh flowers are required to obtain a kilo of essence, and often a kilo of fresh violets costs a shilling a pound to buy. Violet essence can, however, be marvellously imitated by a compound of tincture of orris root, which, when cleansed with alcohol and solidified, has an odour of violets, stronger than the perfume of the actual flowers themselves, and resembles the genuine violet scent so closely that only experts can tell the difference. The violet season lasts till the end of March, and the flower farms of Nice and Cannes together grow nearly four hundred thousands pounds' weight of violets annually.

From May to the end of September is the busiest time of all the busy year to the flower farmers, for roses, orange, jasmine, lemon-scented geranium, heliotrope, and many other flowers, beside herbs, are then in full bearing, and the people are in the fields from morning till night, picking the blossoms, separating the petals, and taking them to the perfumeries. Roses are cultivated by the thousands, and in the season as many as a hundred and fifty tons are gathered in the province of the Alpes Maritimes. They are celebrated for a peculiarly delicate perfume exhaled by the flowers, which is said to be due to the pollen carried by the bees from the orange groves to the rose beds. Directly the blossoms are picked they are taken to the factories, spread upon a cool floor, and the petals separated from the stalks. Roses in the Var Valley are principally used for the manufacture of spirituous extracts, pomades, and soaps; very little attar is prepared, the enormous number of flowers required to make even a small quantity prevents its being sold in sufficient quantity to ensure a profit. A hundred thousand kilos of flowers are required to make four and a-half pounds of attar, and though there is no limit to its price, it generally costs at the rate of a pound a drop.

Even more important than the rose to the flower farmer is the orange tree, and he considers it the most lucrative of his stock. From the flowers he obtains an otto worth ten shillings, and a fat worth eight shillings the ounce, and when distilled with water the blossoms yield a fragrant oil used in making eau de Cologne; from the leaves another fat worth three shillings the ounce; from the rind of the fruit an otto worth twelve to sixteen shillings the pound, and when all the juice has been extracted, the pulp is sold to feed the cows, and greatly improves the quality of their milk. The wood of the tree, which is yellowish-white and close grained, is used for inlaying and turnery. In the Var Valley the orange is chiefly cultivated for its blossoms. The season begins in April; gathering the flowers is weary, back-breaking work, for the pickers sit hour after hour, perched up in the trees under the blazing sun, and many fall to the ground, overcome by a peculiar form of syncope, caused by the intense fragrance of the blossoms. Rose leaf geraniums, mignonette, tuberose, jasmine, and other flowers occupy the grower till October, and the flower cycle ends in December with the cassia and the olive.

The Valley of the Var was celebrated during the middle ages, and during the thirteenth century the little town of Grasse, round which the flower trade centres, rivalled Marseilles in commercial importance. Though its greatness is now a thing of the past, it has never lost its position in the perfume industry of France. The peasants who grow the flowers and prepare them for the market are a hardworking, thrifty race. In many cases it is they who own the farms and who dispose of their produce to the perfumers, the prices they receive varying with the amount and quality of the flowers they sell. They are all born gardeners, and their speech bears many evidences that their forefathers inherited the trade from the Arabs, who were excellent agriculturists. They are never out of work. During the summer months, when the plants are in full bearing, every man, woman, and child is employed, and during the winter, which is very short, they are busy collecting, melting, washing, and clarifying the grease, lard, and beef suet in readiness for the coming summer. They live mostly on bread and vegetables, with goats' flesh once a week for a treat. As their trade is never fluctuating, they manage to save a considerable sum during the year, which they regularly deposit in the savings bank, and we learn that "the wealth per head of this peasant population is equal to that of our most flourishing English commercial towns." We in England could learn many a lesson from the flower farmers in the Valley of the Var.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, January 11.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Messrs. A. Worsley, A. W. Hill, G. Gordon, J. Fraser, J. W. Odell, E. M. Holmes, W. E. Ledger, A. D. Michael, H. J. Veitch, W. Fawcett, W. Hales, R. Hooper Pearson, and F. J. Chittenden (hon. secretary).

NOMENCLATURE OF GARDEN PLANTS.—The secretary reported that a recommendation on the nomenclature of garden plants had been drawn up and sent for the congress in Brussels in the spring.

POLYGONUM AMPHIBIUM.—Mr. J. Fraser showed specimens of Polygonum alpestre, which was at one time naturalised at Kew, where it had grown for thirty years, but its habitat had been destroyed by the erection of the new bridge, and the plant exterminated. He also showed specimens of Polygonum amphibium, showing the two forms which are sometimes recognised by botanists growing on one and the same roots.

VARIATION IN FERNS.—Mr. Chittenden showed a specimen of a variegated form of Nephrolepis canaliculata from Wisley, where Mr. Blakey, the propagator, had noticed a solitary specimen among a batch of young ones in 1908. The plant was isolated and grown on, and in 1909 produced spores which were sown separately, and some three hundred young plants were raised and grown on. Every plant showed the variegation in a greater or less degree, some more markedly than the parent, some less. The variegation was in no case particularly marked, but the case is interesting as an example of a sudden variation in kind being reproduced true, although the degree of development of the variation, which probably depends largely upon external conditions, varied in the different plants. He also showed a specimen of a congested form, which likewise reproduced the variation in every plant raised from its spores. The breeding true to a sudden variation does not appear to be at all uncommon, especially if care is taken to isolate the plants before the spores are gathered, in order to prevent mixture of spores and possible crossing.

VARIATION IN BEAN SEEDS.—Mr. H. J. Veitch showed a number of bean seeds, the history of which is as follows: In May, 1908, Mr. James Scott, of the Glade Gardens, Ditton Hill, sowed seed of the Dwarf Bean Plentiful. These are of a rather pale dun colour. After gathering beans several times the plants showed a tendency to climb, and subsequently reached a height of 5ft. The flowers were pale heliotrope. After harvesting the seed was found to have a dark testa marked by light splashes. These seeds were sown in 1909, and produced plants reaching a height of 6ft., and bearing foliage considerably larger than that of the ordinary scarlet runner, while the flowers were of three kinds—pure white, pale heliotrope, and brownish. The seed of this generation varied greatly in colouring, the following types being present: White, with extremely pale veinings; purplish-brown; pure black; reddish-brown; pale pink, with brown streaks and splashes; dark greyish-brown, with pale grey mottling; pale pink, with dark grey-brown streaks and splashes; dark dun, with whitish dots; dark red-brown; dark grey, with whitish mottling; red-brown, with whitish streaks and patches; and grey, with white dots and markings. The original coloured bean does not appear to have been reproduced. The seed will be grown on, and its behaviour followed. A probable explanation is that the crop was cross-pollinated in 1907, and segregation occurred in 1909. There is, of course, a possibility that crossing occurred also in 1908, as bees were within a short distance, and other beans were growing about fifteen yards away; but beans are usually self-pollinated.

VIRESCENT CYCLAMEN.—Mr. Fabius, of Redlands Nursery, Emsworth, sent a plant of cyclamen bearing rosettes of small leathery green leaves in place of flowers. All the flowers were modified in this way. No trace of similar malformations had been noticed in the strain before. It had been raised at Emsworth, and all the plants for seed purposes hand-pollinated. Mr. Bowles and Mr. Hill took examples to endeavour to root the rosettes and note their subsequent behaviour.

ERIODENDRON ANFRACTUOSUM.—Mr. F. H. Seed, F.R.H.S., of Mombasa, British East Africa, sent pods and seed of this wild cotton tree, which grows abundantly in the neighbourhood of Mombasa. The trees bear when about four or five years old, and attain a height of from 40ft. to 70ft., growing very quickly. The pods are about 3in. in length, and when ripe burst open, so that the white, cotton-like substance is set free and distributed by gusts of wind, carrying the seed with it. The cotton is beautifully soft and silky, but the fibres are not very long, and are probably unsuitable for spinning; but it is used for making lifebuoys in Africa, and for a variety of other purposes in India, where it also grows. The tree is valuable also for its timber. A few of the natives collect the pods and sell them to Indians in Mombasa, but it is probable that

many other uses might be made of the material than at present.

ORCHID HYBRID BETWEEN ALBINOS.—Mr. Thwaites, F.R.H.S., of Streatham Hill, showed a flowering plant of Cattleya Gaskelliana alba crossed with C. Mendeli alba. The flowers were not pure white, as in the parents (although they appeared to be so in the bud), but had a faint and very pleasing pearly-pink flush over them. So far two plants have flowered with the same character; others are in bud.

Horticultural Club.

"THE GARDEN OF THE EAST—CEYLON'S ISLE."

After the usual monthly dinner of this club at the Hotel Windsor, on the 11th inst., Mr. Harry J. Veitch, V.M.H., presiding, and a good number of members and guests being present, Mr. J. A. Alexander gave a very interesting lecture on the above subject, illustrating his remarks by a number of very fine lantern slides depicting the scenery and flora of Ceylon. The first slide, representing a map of the island, was utilised to show the three regions into which it is divided as regards the climatal and geological conditions which determine the culture of most of the valuable products it yields. In the south very moist and warm conditions prevail, and large areas were marked out as devoted to the culture of rubber, while all round the coast were dense belts of the cocoanut palm, extending over some 830,000 acres, which palm, when these groves were shown in detail, the lecturer described as probably the most valuable all-round tree in existence. Another slide showed an exhibit of the numerous uses to which it is applied in the way both of food and industrial products. A special group of palm flowers and incipient fruit gave a striking idea of Nature's lavishness in the production of possible fruits, as compared with the actual capacity of the tree to bring them to maturity, dense panicles of many hundreds of incipient cocoanuts resulting in the production of a dozen or two ripe ones. In the centre of the island lies the mountain region with an intermediate climate. The mountains are not very high, the loftiest summit of Adam's Peak only attaining some 8,000 feet. A photograph taken by the lecturer from this summit in the early morning presented a curiously weird effect, the defined pyramidal shadow of the mountain being thrown right across the landscape to the distant horizon. It is in this region that the tea plantations which form the chief staple of Ceylon's industry are situated. Coffee, formerly largely grown, had been practically annihilated by the insidious leaf disease, the spread of which it had been found impossible to resist. The third region, the dry one, occupies the north of the island, and it is here that rich mines of sapphires, rubies, and other precious stones are found to replace the wealth of valuable plant life which the prevailing drought precludes from cultivation.

Several illustrations relating to the rubber industry were very interesting, and the curious fact transpired that this substance, so much in demand in these days, was obtainable from trees of quite different orders, mostly from the ficus or fig tribe, which yielded Para rubber, but also from the manihot, a close relative to the tree which produces tapioca, this yields the Ceara rubber of commerce. Rubber is simply a gum, and is obtained by wounding the tree and collecting the exudation, and one slide showed how bamboo ladders were built between adjacent trees, up which the coolies were enabled to climb for the purpose of collecting to the height of 60 feet or more. The tea industry was illustrated by photographs of tea growing estates of the plant itself, only the young leaves of which, under ten days old, are utilisable, and the apparatus used for withering, rolling, firing, and otherwise preparing them for the market. Cocoa is another staple product, several slides showing its collection in the shape of large pods containing a dozen or more so-called beans. The cultivation of many spices and other aromatic plants, cinnamon, cardamons, pepper, vanilla, camphor, ginger, nutmegs, etc., was also shown, both in the form of the respective plants and the way their produce were handled, the effect upon the mind being that Ceylon was peculiarly rich in wealth of this description. A giant bamboo on the banks of a stream evoked particular admiration, so huge were the stems, and so dense the widespreading crest of foliage, that the comparatively tiny figure of a man close by was hardly appreciable. If we imagine a bamboo rod 30 feet in length, which could be cut into sections big enough for large flower pots or buckets, a slight idea is obtained of what a bush of some hundreds of such must be as a specimen of tropical vegetation.

Some views taken in the celebrated gardens of Peradoniya were also very beautiful, as was a photo of the inflorescense of the Taliput palm, like an enormous bunch of white ostrich plumes 40 feet in height, independently of the stately tree trunk itself. The lecture, in short, was full of interesting and practical data, and embraced a warning in connection with rubber which may well be borne in mind in these days of speculation, viz., that 10 or 12 years are requisite to establish plantations ripe for gum production, while many projects are based on five or six years' calculation, and are therefore likely to fail owing to premature enfeeblement of the young trees. A hearty vote of thanks concluded the meeting.

Beckenham Horticultural Society.

At the recent meeting of this society Councillor Lees presided over an excellent attendance of members and friends, many ladies being present. A most delightful evening was spent. Mr. Charles H. Curtis, after briefly outlining the history of the Royal Gardens, Kew, and dealing with the great work of the establishment in the furtherance of horticultural practice, botanical science, and Colonial industries, acted as "guide, philosopher, and friend" to the audience, and, by means of about seventy splendid lantern slides, conducted the members round the famous national gardens. Mr. Curtis proved an excellent guide, and his facts, figures, and descriptions, accompanied by touches of quaint humour, held the interest of everyone completely for an hour and a half; and when he concluded, the burst of applause, as also did the subsequent vote of thanks, showed how well his efforts to instruct and interest the meeting had succeeded.

British Gardeners' Association.

(London Branch.)

An interesting meeting of the above branch was held at Carr's Restaurant on Thursday, January 13, when Mr. A. W. Tidy, of Kew Gardens, gave an interesting lecture upon "The Exhaustion and Restoration of Soils." The chief points dealt with were: The classification of soils, and their chemical compositions; organic matter, including animal refuse, its decomposition, and what it yields in the way of plant food; the detrimental effect of stagnant water, and the natural processes it retards; the composition of organic and inorganic materials, and their disintegration; the loss of nitrates, etc., from the soil by drainage; exhaustion of soils by growing crops; rotation of crops as an aid in economising the constituents of the soil; restoration of soils by natural agencies, by tillage operations, and by applications of organic and inorganic manures. Mr. Tidy also explained the chemical composition of different manures, together with the best time and methods of application.

The discussion which followed was ably sustained by Messrs. Wood, Prince, Feltham, and Cowley. The lecture was thoroughly appreciated by those present, and the vote of thanks proposed by the chairman was heartily accorded.

It has been decided by the branch committee to arrange a Bohemian concert to take place at Carr's Restaurant on Saturday, March 19. There is plenty of talent among the members, and the Concert Committee find no difficulty in securing artistes when arranging the programme, proving that gardeners possess greater social accomplishments than they are usually credited with.

The proceeds of the concert will be given to a London hospital, so that the association will be in a position to offer a bed to any of its members who may be unfortunate enough to require hospital treatment.

The Executive Council have taken the first practical step in the direction of State recognition of horticulture, by approaching the Registrar-General with the request that gardeners shall be placed under a separate heading at the next census. The matter is still under consideration by the authorities.

Bournemouth Gardeners' Society.

On Tuesday evening, January 11, about fifty members of this association attended the annual supper, which was held at Messrs. Bright's Restaurant, Gervis Place, Bournemouth.

The president, J. H. Ralph Smythe, Esq., J.P., occupied the chair. Members of kindred societies also attended, and a very pleasant evening was spent.

After the supper and the loyal toasts the evening was devoted to matters having special reference to the Bournemouth and local societies, and to officials connected therewith. Songs, recitations, and music added greatly to the enjoyment of the evening.

In Bournemouth and its immediate neighbourhood a number of Gardeners' Mutual Improvement Associations now exist. Over twenty years ago Mr. J. B. Stevenson was chiefly responsible for the formation of the Bournemouth Association. He is still hon. secretary; and Mr. W. Shave, head gardener to the Dowager Lady de Tabley, Berry Court, is the hard-working assistant secretary. The membership now totals about one hundred, and during the past few years kindred associations have been successfully formed, so that at the present time there is a keen spirit of emulation among the gardening fraternity in this part of the county of Hampshire.

There is a strong programme of papers to be rendered during the spring months, and it is confidently expected that the meetings will be well attended. The funds are, on the assurance of Mr. Reeves, the hon. treasurer, in a satisfactory condition. Mr. Barge is the courteous librarian.

Aigburth Gardeners' Society.

The first meeting of this society was held at the People's Hall, Sefton Park, Liverpool, under the presidency of W. P. Wethered, Esq. There was a good attendance of members and friends, and the tone of the meeting gave promise of a successful career for the society. Mr. George Haigh, Highfield Gardens, Woolton, delivered a capital address on "Winter-flowering Carnations," and this was supplemented by one from Mr. C. A. Young, of West Derby, the combination giving details from the private and trade growers' points of view.

At the conclusion of the addresses a good discussion was taken part in by several speakers. A cordial vote of thanks was tendered to Messrs. G. Haigh and C. A. Young for their contributions, and to the chairman for presiding. Mr. W. Barber, Carnatic Hall Gardens, Mossley Hill, Liverpool, has been appointed secretary of the society. The next meeting takes place on February 1, when Mr. R. G. Waterman, of Woolton, gives a paper on "Soils and their Treatment."

The Loganberry.—The method of pruning the loganberry is exactly the same as that adopted for the raspberry, the old fruiting wood is cut out, and the young growth well thinned; these should be trained to wires eight feet high, and planted at a distance of six feet from row to row, and the sixteen to eighteen feet asunder.—H. R. F.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

FAILING HELLEBORES.—T. E. G., Harpenden: The brown and dead leaves and the short flower-stems point to serious trouble at the roots. The failure is probably due to the grubs of the Crane Fly, which are frequently found attacking the roots of hellebores.

APPLES GRAFTED ON LABURNUMS.—D. B., Ayrshire: Neither apples nor pears would prove successful on the laburnum stock, even supposing scion and stock were to unite, which we very much doubt. Plants that have no affinity one with the other cannot be successfully united by budding and grafting. The laburnum belongs to a totally different natural order to the apple and pear; these latter belong to the Rosaceæ, and the former to the Leguminosæ. You must grub up the laburnums, thoroughly work the ground, and plant thrifty apple or pear trees, if you wish to obtain fruit.

DOUBLE ARABIS AND MUSCARI HEAVENLY BLUE.—J. C., London: To the note on p. 27, which suggests we were hardly correct in advocating Muscari Heavenly Blue in conjunction with double arabis for spring effects, we have had no reply from correspondents. Perhaps our friends are too busy with the General Election to heed the matter. However, we may say in justification of what we wrote on p. 1,001 of the GARDENERS' MAGAZINE of 1909, that for several years we had the combination referred to in our own garden, and it was eminently successful. Probably the double arabis would smother the muscaris if allowed to grow undisturbed and without let or hindrance for several years; but, if kept within reasonable bounds, and regularly transplanted between the groups of muscaris, the latter rise well above the former. In our own experience Muscari Heavenly Blue cannot be regarded as "the delicate little muscari," for we had abundance of spikes ten inches high. We make a further suggestion, and it is to plant Muscari Heavenly Blue with Narcissus Johnstonei Queen of Spain; these together, on a gentle slope, make a delightful combination.

PERENNIAL ADONISES.—M. E., Birmingham: The best of the perennial adonises are A. amurensis, A. pyrenaica, and A. vernalis. Two other species, A. Walziana and A. wolgensis, are in cultivation, but they are chiefly of interest to specialists. Of A. amurensis and A. vernalis there are several varieties, and each of these has some distinctive point to recommend it. The double-yellow variety of A. amurensis is a charming plant, and especially suitable for pot culture in a cold frame or greenhouse, as it flowers in February or early March out of doors, but is often spoiled by the weather then prevailing.

MITE IN AMARYLLIS BULBS.—E. C. P., Southampton: An excess of moisture during the resting period has brought about a condition that has rendered all sorts of troubles possible. The mites present are those of Rhizoglyphus echinopus, the Bulb Mite. Remove any decaying parts of the bulbs, wash well with hot water, and then soak the bulbs for ten minutes in water at a temperature of 125 deg. Drain and dry the bulbs, dust them freely with a mixture of fine dry charcoal and flowers of sulphur, and put them on a dry shelf in a light place in an intermediate house. After a week or so of this treatment the bulbs should be quite dry and healed, and they should then be potted in small pots and given ample drainage. The soil should be just comfortably moist, but not in any degree sticky, and no water should be given directly until growth has advanced and new roots are working in the soil. The moist atmosphere of an intermediate house, and moist material in which to plunge the pots, will provide sufficient moisture for quite a long time to come.

RHODODENDRONS.—F. C., Leicester: It was in 1906 that rhododendrons found so much favour with the Floral Committee of the Royal Horticultural Society. A resumé of the trees and shrubs gaining distinction in 1906 was published on p. 27 of the GARDENERS' MAGAZINE for January 12, 1907, and shows that, out of nine Awards of Merit granted for this class of plants, six were granted to rhododendrons, the varieties being White Pearl, Gill's Triumph, Mrs. E. C. Stirling, Marchioness of Tweeddale, Gomer Waterer, and Viscount Powerscourt. Vitis armata Veitchi, V. Henryana, and Daphne rupestris were the other shrubs to secure awards.

INSECTS ON BARK OF TREES.—A. B., Ashbourne: The piece of beech bark shows an infestation of the Beech Coccus, a pest it it very difficult to eradicate. You refer to certain measures having been taken, but without success. Kindly let us know what these measures were, and when carried out. The other pest we do not recognise at present, but we hope to reply further in a week or two.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

T. H., Newbury.—1, Ardisia crenulata; 2, Callicarpa purpurea.

L. H. B., Ipswich.—1, Cattleya Trianæ; 2, Dendrobium heterocarpum.

I. F. J., Hitchin.—1, Peristrophe speciosa; 2, Chimonanthus fragrans.

A. L. C., Burton-on-Trent.—1, Iris stylosa; 2, Erica gracilis; 3, Ruscus aculeatus.

W. G. N., Newcastle.—1, Monochætum Humboldtianum; 2, Cypripedium Leeanum; 3, probably a form of Cypripedium Euryades.

TRADE NOTE.

We have received specimens of a particularly effective and durable label from Messrs. Kirkland and Co., of Albion Potteries, Etruria, Stoke-on-Trent. These are made of double-baked porcelain, and the names of roses, fruits, orchids, or what not, are lithographed on to the material under the glaze; consequently the name is always clearly discernible, and, as weather has no effect upon name or label, the latter is practically everlasting.

FORTHCOMING ENGAGEMENTS.

TUESDAY, January 25.—Royal Horticultural Society: Committees meet at 12 o'clock; Lecture at 3 p.m. on "Intensive Cultivation of Vegetables in Madeira," by Miss Armitage; Scientific Committee at 4 o'clock.

The Harry Veitch Portrait will be on view at the Royal Horticultural Hall, and a dinner to Mr. and Mrs. Harry Veitch will be given in the evening.

SATURDAY, January 29.—French Horticultural Society of London: Twenty-first Anniversary Dinner at the Café Royal, Regent Street, under the presidency of Mons. Philippe de Vilmorin.

MARKETS.

CATALOGUES RECEIVED.

H. CANNELL AND SONS, SWANLEY.—This seed list is a familiar "herald of spring," and its offer of "golden seeds" comes along once more. The firm catalogues a goodly number of flower novelties and some special selections among vegetables.

CHAS. TURNER, ROYAL NURSERIES, SLOUGH.—This is a useful catalogue of select varieties of flowers and vegetables. The descriptions are to the point and the arrangement is excellent.

MESSRS. BEES, LIM., MILL STREET, LIVERPOOL.—A remarkable catalogue of flower and vegetable seeds offered in penny packets. The range of subjects is wonderful, and the closely printed little book of 128 pages is a useful work of reference.

BARR AND SONS, COVENT GARDEN.—The title of this handy, well got up and alphabetically arranged catalogue of flower and vegetable seeds is "Seeds for all Seasons and Climates." Descriptions and cultural directions are brief and excellent.

NOW IS THE TIME TO PLANT Kelway's beautiful Blue Delphiniums, in borders and beds; as clumps on the lawn, and at the sides of carriage drives. There is no hardy flower more stately and of lovelier shades of BLUE—that precious colour in the garden.
We recommend the following named collections:—
Collection B, 15s. a dozen; 100 for £5 10s.
Collection D, 34s. a dozen, 3s. each plant.
KELWAY and SON, Langport, Somerset.

KELWAY BORDERS.
A perfect picture in your garden to last for years will be the result if you allow us NOW to plan a scheme, whether of contrasts or of harmonies. Our "Artistic" Border, 30 yards by 10ft., costs £12 10s. only.
Consider what is "saved" in heat and labour by this system, and what is gained in true beauty.
KELWAY and SON, The Royal Horticulturists, Langport.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

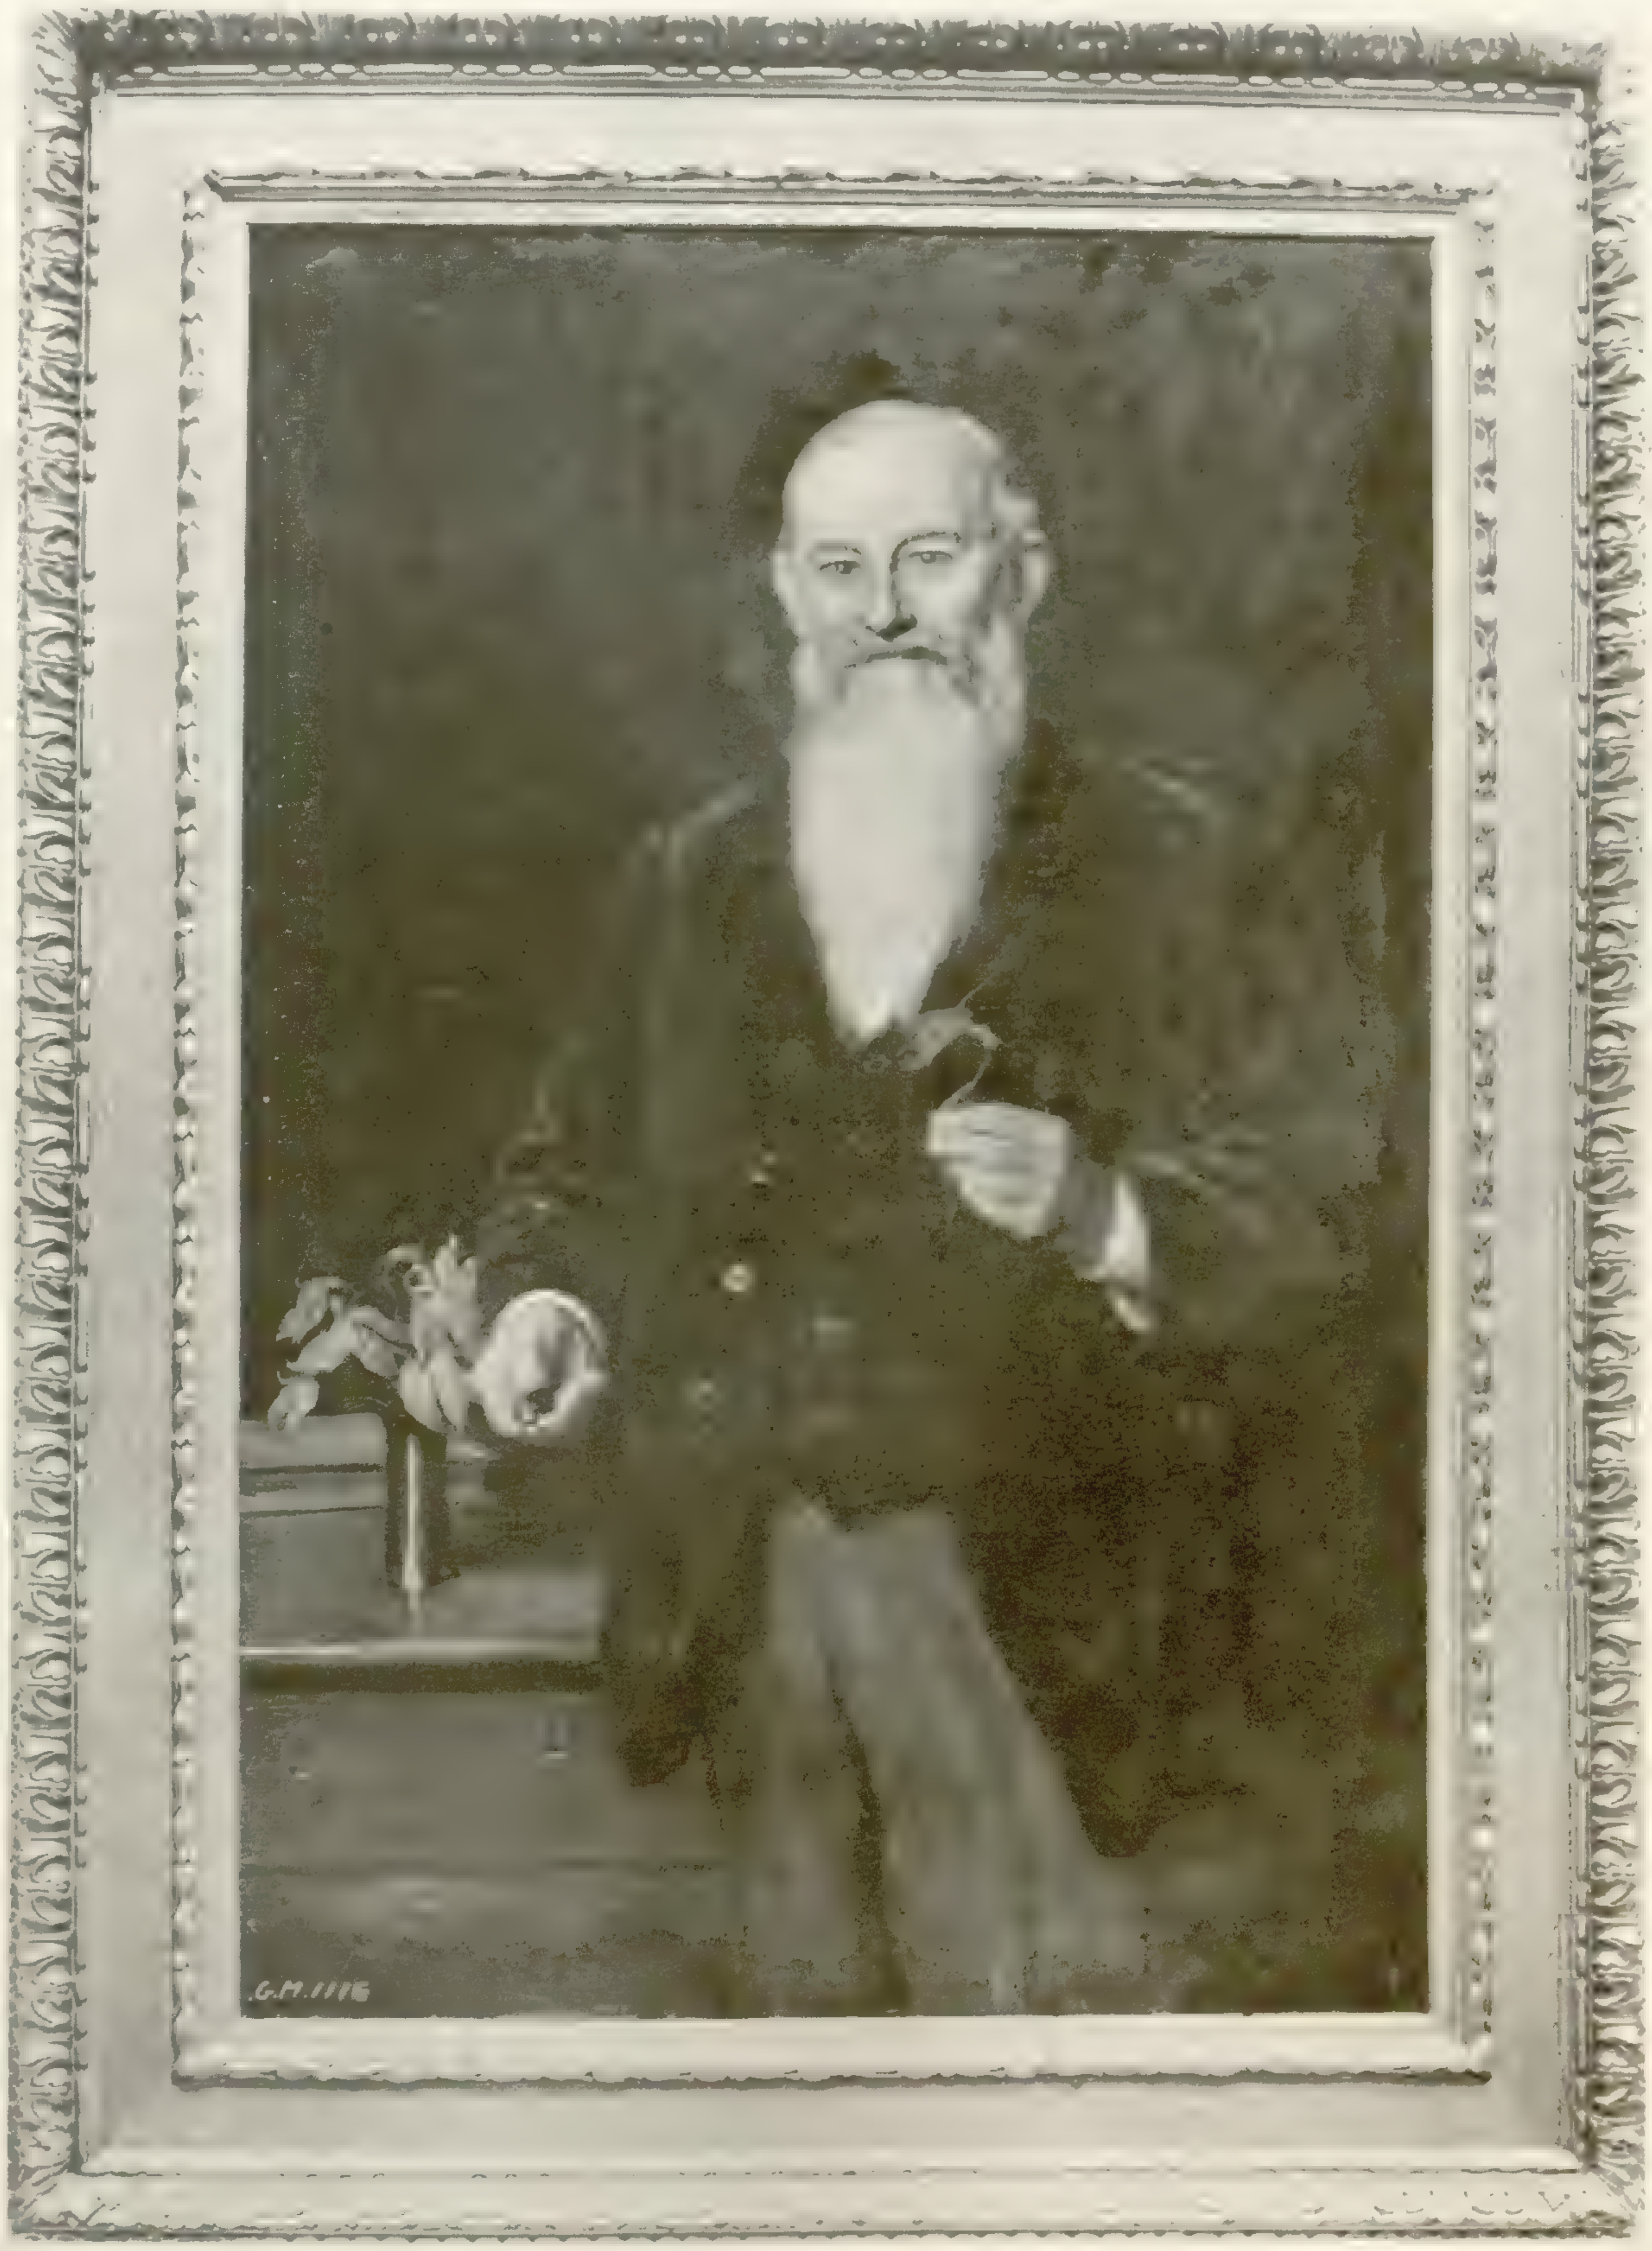
THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Vegetables and Animals.

In mentioning the two great branches into which organic life is divided, we have put vegetables first for the simple reason that when life was first existent on the face of this world of ours, it must have been in vegetable form. No animal can derive nourishment directly from inorganic sources as plants are capable of doing, and hence the animal could only subsequently have been evolved from a vegetable progenitor, and when evolved could only exist at the expense of the vegetation in its environment which it was able to seize upon and assimilate as organic food. Hence, as regards time, the vegetable must be the older and thus entitled to claim priority. To this day the same fundamental difference exists, and all animals must perforce maintain themselves, either by devouring vegetation direct or other animals which have done so previously. Our chemists have acquired great skill in creating drugs and medicines, some from inorganic materials, but most from organic ones; but no one has yet contrived a food which will sustain life on continued lines by mere combination of inorganic salts and gases, such as is effected in the microscopic laboratories of the cells of leaves. Another point is that, as a consequence of this, a vegetable world is conceivable with an entire absence of animal life. Popularly it is assumed that life in its two forms is maintained by a sort of mutual interaction between them, the plants absorbing the carbonic acid exhaled by the animals, and the animals taking in as their vitalising factor the oxygen set free by the plants when they have extracted the carbon therefrom, thus restoring the balance. This, however, can only be a part, and a small part of the truth, for the proportion of vegetable life on the world's surface must be far greater than that of animal life, since in many parts of the world we see vast areas of luxuriant forest growth absolutely crowding the surface, to which the animal life therein can bear no sort of counterbalancing proportion at all. Hence it may be assumed that were the animal world entirely exterminated, the vegetable one would still survive. It cannot, however, be assumed that it would continue to maintain its present aspects and types. As all flower lovers know, there is a potent interaction between the two worlds in another direction. A great proportion of our floral wealth is entirely due to the selective influence of the insect tribes which act as factors in cross-fertilisation. It is due to this that so much diversity has been evolved coupled with so much beauty. In some subtle way the flowers have responded to the varied instincts and tastes of their visitors, and there is little doubt that if these visitors ceased to exist, and so far as other than wind-fertilised flowers were concerned all plants had to fertilise themselves, there would be a general decadence of type, and probably in many cases an entire extinction of the race through lack of power in its members to adapt themselves to the altered conditions, or through gradual reduction of vigour by constant inbreeding. Apart from this we have also to consider the great modifications of form brought about by the need for protection. The thorny and prickly growths, the hard shells of nuts, the tough barks, and so forth, being no longer needed, there would be a gradual loss of these through the survival of progeny varying in a more defenceless direction, and the vegetable char-



MR. HARRY J. VEITCH, V.M.H., F.L.S.
From the presentation portrait, painted by Mr. Hugh C. Riviere, and now hung in the R.H.S. Council Room.

acter and habit would hence be modified accordingly. Then we may consider the innumerable fruits and seeds which have been evolved with attractive pulps or means of attachment, designed so as to encourage the animal world to disseminate the seed in the various ways familiar to the botanist. All these contrivances would lose their raison d'être entirely, and would consequently deteriorate and vanish, again to the prejudice and possible extinction of all but the simplest forms; so that in point of fact the process of evolution would be reversed. As a result of all this, assuming a vegetable world devoid of animal life, we must imagine it as one consisting entirely of self-fertilising plants of low degree or of wind-fertilised ones, implying plants of greater vigour and probable longevity as regards the individual race; and finally of similar plants to our ferns, equisetal mosses, fungi, and sea-weeds, embracing only such as complete their life cycles without animal intervention.

Mr. Harry J. Veitch, V.M.H., F.L.S., is so well known, both at home and abroad, wherever horticulture receives attention, and is so highly esteemed by all who are interested in gardening, that in referring to him, it appears almost superfluous to mention his splendid accomplishments, either in the advancement of horticulture, or the support of gardening charities. We have had a remarkable proof of the wide knowledge of Mr. Veitch's services in the cause of horticulture and also of their general appreciation in the painting of his portrait by subscription. A short time since, some of Mr. Veitch's friends who are associated with him in the management of the Royal Horticultural Society, felt that the time had arrived when his services should have public recognition. The painting of his portrait by subscription for the Council Room of the Royal Horticultural Society suggested itself. Mr. Veitch's consent having been obtained, subscriptions were invited, and the response was so ready and generous that the Rev. W. Wilks and Mr. H. B. May, who had charge of the matter, very soon received an amount considerably beyond what was necessary for having the portrait painted by an artist of the highest eminence. It was thereupon decided to give to every subscriber a photogravure of the portrait, and to have a second portrait painted by Mr. Hugh Riviere for presentation to Mrs. Veitch. Even this did not wholly exhaust the fund that had been raised, and it was decided to invite Mr. and Mrs. Veitch to a dinner on the occasion of the presentation to the latter of Mr. Veitch's portrait, and to ask a number of the subscribers to meet them. A report of the gathering will be found on another page of this issue, and it should here be mentioned that the portrait which appears on our first page is a reproduction of the one which now hangs in the Council Room at the Horticultural Hall. As the head of a firm of commanding importance, and possessing exceptional foresight and great business ability, Mr. Veitch has contributed largely to the enrichment of our gardens with an immense number of beautiful hardy and tender plants. Considerable numbers have been introduced from their native habitats, but a much larger number have been raised as the result of cross-fertilisation and hybridisation. To refer to the triumphs that have been achieved is not now necessary, but it must be mentioned that they have greatly enhanced the interest and attractions of our flower gardens and plant houses. Not less valuable have been the services rendered by Mr. Veitch in the cause of the gardening charities. For nearly a quarter of a century he has been the chairman of the Gardeners' Royal Benevolent Institution, and has contributed generously to its funds. At the dinner on Tuesday the Chairman stated that the princely sum of £4,000 had been given by Mr. Veitch and his firm. Although no mention of the fact was made at the dinner, Mr. Veitch must have contributed nearly half that amount to the Royal Gardeners' Orphan Fund. Four years since, Mr. Veitch had the Victoria Medal of Honour in Horticulture conferred upon him, and he would have been included among the sixty original recipients in 1897 had not the Council then resolved that no member of the Council should receive it. In 1908 he received from the late King of the Belgians the distinction of a Chevalier of the Order of Leopold.

Horticultural Club.—The annual meeting and dinner have been postponed to Tuesday, February 22, and will take place, as usual, at the Hotel Windsor, Victoria Street, Westminster, the meeting at 5 p.m., and the dinner at 6 p.m. sharp. Sir John Llewelyn, Bart., the president, will take the chair, and Messrs J. Veitch and Sons, have promised to decorate the tables with flowers, as in past years.

Horticulture in Scotland.—It is much to be regretted that the general public resident on the other side of the border do not support the Royal Caledonian Horticultural Society in a more substantial manner than it has been doing of late years. The society has done, and is doing, splendid work for the advancement of horticulture in Scotland, and yet the Council had to express regret in the report presented to the annual meeting held at Dowell's Rooms, Edinburgh, that they could not report any substantial increase in the interest taken by the public in the exhibitions. There was a further falling-off in the attendance at the spring show, and only a slight increase in the attendance at the great centenary show held in September. This apathy, for which there is just cause for complaint, has, it would appear, quickened the interest of gardeners in the society, for they have become members in increased numbers. In the course of the proceedings, Mr. J. W. M'Hattie moved: "That a remit be made to the Council, with power to hold friendly conferences with the Council or members of the Scottish Horticultural Association as to the future of both societies, and to report." As recorded in these pages, a meeting of the Councils of the Royal Caledonian and Scottish Horticultural Societies was held a short time since, and Mr. J. W. M'Hattie, who presided, stated that he could not hide from himself the fact that the public support which both societies were receiving was not sufficient for the work that should be done for horticulture in Scotland. Therefore some of those who were anxious that an improvement in the existing state of things should be made, thought that if they could arrive at some plan whereby every lady and gentleman interested in horticulture, in both societies and out of them, could fix their minds and their resources in one effort for the advantage of horticulture, and if they could possibly join forces at the same time it would be for the benefit of horticulture. If the new society were formed he made the suggestion that life members of both societies be admitted to it, and he would even go the length of admitting the ordinary members of both societies into it at the rate at which they were formerly entered. It would, Mr. M'Hattie believed, be an advantage to horticulture in Scotland to have one strong, united society, and the motion was carried.

Carnation Mrs. Burnett.—With reference to this beautiful perpetual-flowering variety, Mr. G. R. Nicholls writes from the gardens of Brockham Park, Betchworth, as follows: "I was surprised to read in Mr. Allwood's excellent article on perpetual carnations in the Gardeners' Magazine, of the 8th inst., that he considered Mrs. Burnett to have a poor constitution. I find it one of the strongest growers we have, and could show him plants that are twelve months old in nine-inch pots carrying eighteen good leads. I enclose a photograph of five plants taken a fortnight since." The plants represented in the photograph received from Mr. Nicholls are well furnished with growths that appear to be in a vigorous state.

Horticulture at Brighton.—We are sorry to learn from the annual report and financial statement that the work accomplished by the Brighton and Sussex Horticultural Society resulted in a deficit of £76 19s. 11d. We regret this result all the more because the executive has made strenuous endeavour to quicken an interest in the society and its work by making material changes in the exhibitions. For many years the society has held three exhibitions annually, but as the support was not sufficient to maintain them at the high level of excellence which has characterised them, it was decided to abandon the spring and late summer shows, and to hold a rose and sweet pea show in June, and continue the chrysanthemum show in November. The exhibition of roses and sweet peas was, as an exhibition, a decided success, but the financial results failed to realise expectations. As shown in the financial statement, the cost of the exhibition was £289 15s. 7d., and the receipts were £168 16s. On the chrysanthemum show the sum of £227 11s. was expended, and the receipts were £160 11s. These differences would not have mattered had there been a substantial subscription list, but the contributions from subscribers only amounted to £204, and from this sum £120 15s. had to be taken to defray the general expenses. The society was charged £56 11s. for the hire of the Dome and Corn Exchange, in which the exhibitions were held, and it appears to us that the municipal authorities are wanting in public spirit in charging such high rates to a society that by its efforts contributes so appreciably to the attractions of the town.

Cross-fertilisation of Sweet Peas.—With reference to this subject (see Gardeners' Magazine of the 15th inst., page 42), Dr. Francis Darwin writes to "Nature" as follows: Under the above heading a writer in "Nature" of January 6 refers to "the statement that the sweet pea is invariably self-fertilised," a statement which he thinks is "often based on an opinion of Charles Darwin's." In refutation of this opinion your correspondent describes the visits of the hive-bee and of Megachile to the flower in question. These same species were seen by Mr. Darwin to visit sweet pea flowers ("Cross and Self-fertilisation," 1876, p. 156). He goes on to ask how it is that the varieties are not habitually mongrelised, and sums up his discussion in the following words: "Whatever the cause may be, we may conclude that in England the varieties never or very rarely intercross. But it does not follow from this that they would not be crossed by the aid of other and larger insects in their native country, which in botanical works is said to be the South of Europe and the East Indies. Accordingly I wrote to Professor Delpino, in Florence, and he informs me 'that it is the fixed opinion of gardeners there that the varieties do intercross, and that they cannot be preserved pure unless they are sown separately.'"

Dry Rot of Potatoes.—An investigation has been conducted at University College, Reading, by Miss Sibyl Longman, into the dry rot of potatoes caused by the fungus Fusarium solani. The object of the research was of a threefold character: (1) To determine whether the fungus is capable of inducing the disease in the growing potato plant, as well as of setting up the well-known pathological condition in the stored tuber; (2) to ascertain whether dry rot can be induced in potato tubers directly by inoculation with spores of Fusarium solani, or whether, as is commonly supposed, dry rot only follows upon wet rot; and (3) to determine experimentally whether tubers infected by F. solani can be sterilised by heat, i.e., whether the death temperature of the fungus is higher or lower than that of the tuber. The results of the investigation serve to confirm the conclusions already reached by Smith and Swingle in 1904. It was found that F. solani is a true parasite capable of destroying both the resting tuber and also the aerial shoots of the growing plant; that there is no necessary time-relation between an outbreak of dry rot and one of wet rot, but that the disease may be induced by inoculating healthy tubers with pure cultures of the spores of the fungus; and that sterilisation by heat is not possible, as the temperature capable of killing the fungus is higher than that by which the potato loses its vitality.

Royal Gardeners' Orphan Fund.—We have much pleasure in stating that Sir Jeremiah Colman, Bart., will preside at the annual dinner of this charity at the Hotel Cecil, Thursday, May 19.

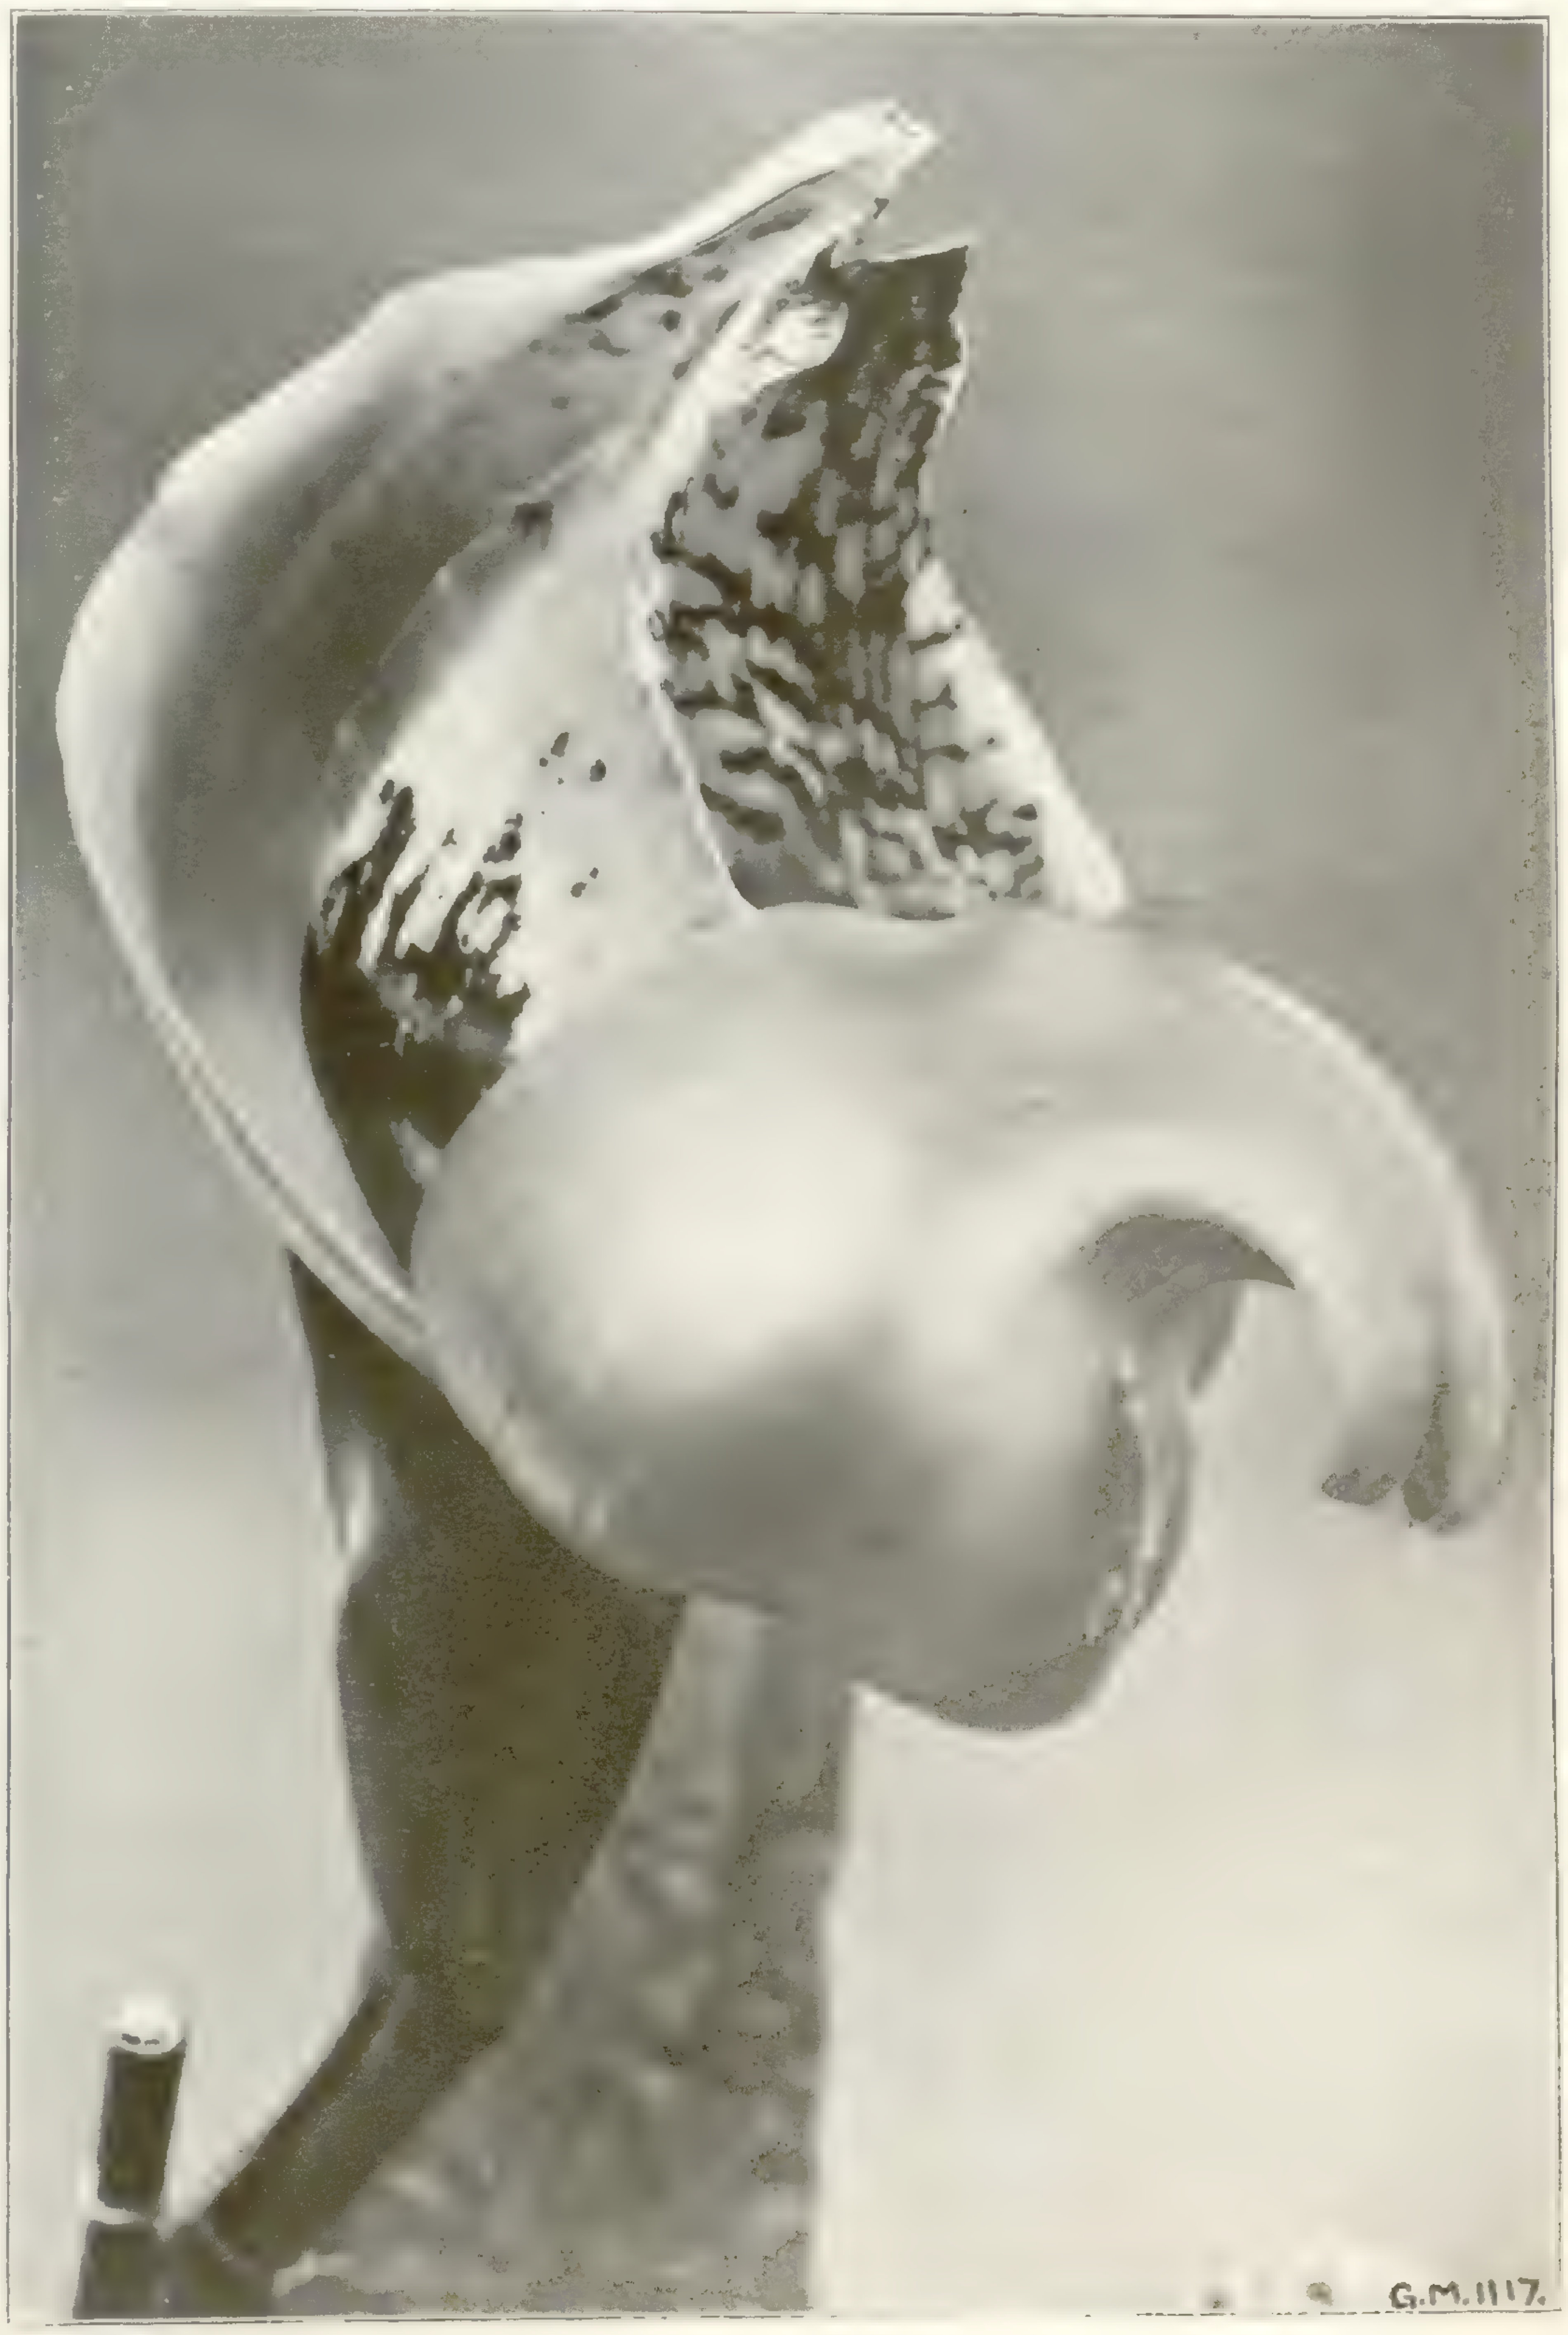
New Trees on Old Sites.—Where tree planting has to be carried out it is always most desirable to plant on fresh land, but this cannot always be managed. For various reasons it not seldom happens that a new tree must occupy the site of an old one, and when this is the case special preparation of the soil should be attempted. Discussing this matter the "Journal" of the Board of Agriculture points out rightly that "the roots of the old tree should be first removed as completely as possible so that no decaying wood be left in the soil, and a circular hole, at least 6ft. in diameter and from 1½ to 2½ft. in depth, should be dug and left open to almospheric influences as long as possible before the tree is planted. The soil may also be sweetened and freed from insect and fungus pests by a dressing of quicklime. If fresh soil can be substituted for that dug out, the newly-planted tree will have a better opportunity to flourish. Should the orchard happen to be on grass land it will be an aid to the tree also if the grass be not allowed within three or four feet of it for the first few years after planting."

Veitch Memorial Medals.—We are informed that at a meeting of the Veitch Memorial Trustees, held on the 18th inst., it was decided to present silver medals to the following gardeners in recognition of distinguished services rendered by them to horticulture, viz.: Mr. H. J. Chapman, of Oakwood Gardens, Wylam-on-Tyne; Mr. J. McIndoe, V.M.H., formerly of Hutton Hall, Guisborough; and Mr. W. H. White, orchid grower at Burford Lodge, Dorking. It was further decided to offer to the Royal Horticultural Society a prize of £5, with a medal, for an exhibit of fruit to be competed for at the forthcoming show to be held at Liverpool in connection with that of the Royal Agricultural Society; and also £5, with a medal, to the Taunton Deane Horticultural Society for competition at their next show.

Chrysanthemums at York.—We are much gratified in learning that the work accomplished by the Ancient Society of York Florists in 1909 proved highly successful. According to the report submitted to the annual meeting, the total receipts were £578 6s. 11d., and expenditure £544 18s. 3d., leaving a balance of £33 8s. 8d. to the good, thus enabling the committee to pay off the adverse balance at the bank at the commencement of the year. The funds of the society now consist of £100 on loan with the York Corporation and £1 0s. 11d. at the bank. The receipts for admission to the chrysanthemum show amounted to £237 6s. 9d., as against £236 in 1908 and £235 in 1907. The amount expended in prizes was £172 2s. 6d. Mr. Oram, who has retired from the secretaryship, after eleven years of excellent service, was, on the motion of the Lord Mayor of York, accorded a hearty vote of thanks.

ROYAL HORTICULTURAL SOCIETY.

There was a quite new arrangement of the staging at the Royal Horticultural Hall on Tuesday last, as the platform was occupied by the tables for the dinner to Mr. and Mrs. H. J. Veitch the same evening. Consequently, the left half of the hall was filled with short staging, and each exhibitor had a small space all to himself. There was an interesting display, but not a very large one. Orchids were prominent. The new presentation portrait of Mr. Harry J. Veitch, hung in the hall, proved a great attraction.



ANGULOA CLIFTONI.

A new species with yellowish-green sepals, and paler green petals that are heavily stained, especially at the base, with bright purple-red. F.C.C., R.H.S., January 25. Messrs. Charlesworth and Co., Haywards Heath.

FLORAL COMMITTEE.

Messrs. James Veitch and Sons, Chelsea, were again large exhibitors. In one group they had standard Indian azaleas, well in bloom, arranged over a groundwork of ferns. One length of tabling was filled with Javanico-jasminiflorum rhododendron hybrids, the blue Coleus thyrsoideus, the new Tradescantia White Queen, Freesia refracta alba, Erlangea tomentosa, Tillandsia Lindeni, Calceolaria Burbidgei, and Otaheite oranges. An interesting little group of early spring flowers from Messrs. Barr and Sons, Covent Garden, was greatly admired. The chief subjects were Galanthus Ikariæ, G. Elwesi, Tulipa saxatilis, various lachenalias, Hamamelis zuccariniana, Daphne Mezereon, Iris reticulata, Roman hyacinths, scillas, and varieties of Helleborus niger—a very pretty little exhibit.

Messrs. H. Cannell and Sons, Swanley, submitted flowers of their fine strains of Chinese and stellate primulas. Ferns were largely shown by Messrs. H. B. May and Sons, Edmonton, davallias, the new nephrolepis, aspleniums, and Stag's Horn ferns being the chief subjects submitted. The Messrs. May also showed a small group of azaleas. Cyclamens in a great variety of colouring, including the fine Salmon King, were shown by Messrs. Stuart Low and Co., Enfield, who also had camellias and other hard-wooded plants in flower, and cut carnations.

Messrs. Thomas S. Ware, Feltham, contributed a very interesting collection of saxifragas, Christmas roses, irises, hardy primulas, iberis, and other dwarf alpines. Mr. G. Reuthe, Keston, sent up a few irises, snowdrops, snowflakes, and small evergreen shrubs. Mr. H. F. Chapman, Guldeford Lodge, Rye, showed some very charming freesias, including the yellow F. Chapmani, and some very pretty seedlings, showing a considerable variation in colour. Some hybrids of Cyclamen ibericum were also shown by Mr. Chapman.

Mr. H. Burnett, Guernsey, showed a very beautiful lot of carnation flowers, setting up fine vases of Mrs. H. Burnett, Mrs. Tatton (new pink), Enchantress, White Perfection, Marmion, Rose Dorée, Wanoka, a fine crimson, and Snow Queen.

There were numerous exhibits of sundries on the occasion, and from the GARDENERS' MAGAZINE office came a selection of coloured plates and illustrations that have appeared in these pages, and copies of the horticultural books issued from 148, 149, Aldersgate Street.

ORCHID COMMITTEE.

Messrs. James Cypher and Sons, Cheltenham, showed a collection of cypripediums, and a few other orchids, the leading features being Cypripedium Mrs. W. Mostyn, C. Thompsoni, C. gigas Corndean var., C. Leopoldeanum, C. Clio Chardwar var., C. aureum virginale, the splendid C. Beekmani, and several good forms of Lælia anceps and calanthes. Mr. Maurice Mertens, Ghent, brought over a few seedling odontoglossums. Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, showed Odontoglossum Vuylstekeæ, O. St. Peter, O. crispum Mrs. Goodson, and O. Wiganianum Goodson's var. Messrs. J. and A. McBean, Cooksbridge, were represented by some beautiful white varieties of Lælia anceps, in fine contrast with coloured forms, together with Epiphronitis Veitchi, and a few Odontoglossum crispum.

A very pretty group of orchids was submitted by Messrs. Stuart Low and Co., Bush Hill Park, Enfield, and this contained the bright Lælio-cattleya Charlesworthi, L.-c. Cappei, some fine odontoglossums, cypripediums in great variety, Dendrobium heterocarpum, some cattleyas, and a margin of the graceful Platyclinis glumacea. An array of cypripediums from Mr. C. Rogerson, West Didsbury, Manchester, contained C. aureum virginale, C. Congo, C. insigne Luciani, C. aureum Surprise, C. Lathamianum splendens, C. Hindeanum, and C. Euryades magnificum New Hall Hey var.

Mr. J. Forster Alcock, Northchurch, showed a few dozen cypripediums, but disposed the plants rather too thinly, consequently the pots were very much in evidence; there were good Leeanum and insigne varieties, C. Bingleyense, and some good varieties of C. villosum parentage, but, unfortunately, not a single plant was labelled. Mr. H. J. Bromilow, Rann Lea, Rainhill, sent up Cypripedium Lord Wolmer (A.M.), a fine cross between C. Euryades and C. Leeanum Clinkaberryanum; and C. Charlesworthi Bromilowianum. Mr. H. J. Chapman, gardener to Mrs. Norman Cookson, Oakwood, Wylam-on-Tyne, brought up the beautiful Odontioda Bradshawiæ Cookson's var., with a spike of ten brilliant blooms. Messrs. Charlesworth and Co. submitted a new anguloa named A. Cliftoni (F.C.C.); it has greenish-yellow sepals and broad light green petals that are heavily stained with bright purple-red—very distinct. Cypripedium Wellesleyæ (C. Venus crossed with C. insigne Harefield Hall) came from Mr. Hopkins, gardener to F. Wellesley, Esq., Westfield, Woking.

Odontioda Charlesworthi var., very deeply coloured, was shown by Mr. R. G. Thwaites, Streatham. Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, brought up Cattleya Miranda Westonbirt var. (C. Trianæ crossed C. amethystoglossa), A.M.; and Cypripedium Helen II., Holford's var. Mr. Edward V. Low, Vale Bridge, Haywards Heath, brought up a collection of cypripediums, some pretty varieties of Cattleya Trianæ, Cymbidium cyperifolium, and Odontioda Thwaitesiæ.

Messrs. Charlesworth and Co., Haywards Heath, had a very fine group of orchids, in which the white varieties of Lælia anceps figured largely with Lælio-cattleya Charlesworthi, the beautiful Cymbidium Sanderæ, Odontoglossum coronarium miniatum, O. Wilckeanum, O. ardentissimum, O. Phœbe, Eriopsis rutidobulbon, Vanda Watsoni, V. Amesiæ, Odontioda Bradshawiæ, Oncidium cheirophorum, and Cypripedium villosum auriferum.

A bold display of orchids from Messrs. Sander and Sons, St. Albans, contained many excellent things, such as fine varieties of Lælia anceps, good forms of cattleyas, the old Lælia superbiens with a spike of nine flowers, Cypripedium Beekmanni, Renanthera Imschootianum, the quaint Odontoglossum Groganiæ, Miltonia Bleuana, the beautiful Cattleya Trianæ Magali Sander (A.M.), and Odontioda Chelsiensis.

FRUIT COMMITTEE.

Mr. J. W. Funge, fruit grower to Mrs. Bischoffsheim, Warren House, Stanmore, exhibited three bunches each of Alicante, Lady Downes, and Appley Towers grapes, all of fair size and finely coloured. Messrs. George Fowler, Lee, and Co., Reading, showed bottled fruits and bottling apparatus.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Anguloa Cliftoni, from Messrs. Charlesworth and Co., Haywards Heath.

Award of Merit.—To Cattleya Trianæ Magali Sander, from Messrs. Sander and Sons, St. Albans; to Cattleya Miranda Westonbirt var., from Lieut.-Colonel Holford, Westonbirt, Gloucester; and to Cypripedium Lord Wolmer, from Mr. H. J. Bromilow, Rann Lea, Rainhill.

MEDALS.

Silver-gilt Banksian.—To Messrs. H. B. May and Sons, Edmonton, for ferns, etc.

Silver Flora. — To Messrs. James Veitch and Sons, for greenhouse flowering plants; to Messrs. W. Cutbush and Son, Highgate, for carnations and shrubs; to Messrs. T. S. Ware, Lim., Feltham, for alpines; to Messrs. S. Low and Co., Enfield, for carnations and greenhouse plants; to Mr. L. R. Russell, Richmond, for azaleas; to Mr. J. Forster Alcock, Northchurch, for cypripediums; to Mr. Rogerson, West Didsbury, for orchids; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids.

Silver Banksian. — To Mr. H. Burnett, Guernsey, for carnations; to Mr. E. V. Low, Vale Bridge, Haywards Heath, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. J. and A. McBean, Cooksbridge, for orchids.

The Lowberry.—With reference to your note on the Loganberry, in your issue of January 22, we should like to say that the Lowberry should be grown in exactly the same way, namely, "trained to wires eight feet high, and planted at a distance of six feet from row to row, and from sixteen to eighteen feet asunder."—STUART LOW AND Co.

GARDEN FLOWERS AT ALL SEASONS.

In the bulb and perennial planting time, from autumn until early in the summer, every gardener is given the chance to collect plants that will yield a constant succession of blossom. In cold localities it may be necessary to employ handlights to cover some of the more delicate subjects, especially those that open buds in periods of frost and snow, but in southern places even this precaution can be dispensed with, and yet flowers can be had always. Simple methods of giving shelter are numerous; a horseshoe or oval-shaped low rockery will make a cosy nook in its centre; a dell dug out of the level ground and banked up with pieces of rock will have one or two wonderfully genial sides, and a plateau at the base, in which plants that object to wind can be perfectly cultivated. A bank, with some evergreen shrubs on its summit, will cast a shade welcome to many dainty alpines. Then the introduction either of peat or crushed brick rubble into ordinary soil fits it for keeping different plants in good health.

A brief review of the flowers that will bloom each month of the year out of doors will give suggestions for bed and border, bank and rockery planting.

January, which is the coldest and dreariest period of all, may have Christmas roses, the best variety then being Helleborus niger angustifolius, or St. Brigid's Christmas rose; a hedge or group, of laurustinus makes a beautiful shelter for this, giving florescence at the same time. The Winter Heliotrope, Petasites, or Tussilago fragrans, will yield spikes of lilac-coloured heliotrope-scented blossoms also from among its large clustering leaves. On a south wall, in full sunshine, may often be found the quaint brownish-yellow blooms of Chimonanthus fragrans. Winter species of crocus, such as C. Sieberi, mauve and yellow, should be bright.

February ushers in hepaticas of rosy-red, blue, and white, and opens the sheathes of the snowdrops. Colchicum montanum, a miniature lilac-purple meadow saffron, will also adorn the warm nooks of the rockery, beside the blue Iris stylosa. The south wall should show plenty of red buds opening upon the Cydonia japonica, and white fragrant flowers on the Lonicera fragrantissima. At the foot of the shrubs may be carpets of gold-starred winter aconites, and clumps of the purple Helleborus odorus purpurascens.

March is the month of countless flowers, daffodils, garden primroses, aubrietias, arabis, Funkia subcordata, so valuable for fine foliage, as well as for white spikes; golden doronicums, orange and yellow alpine wallflowers, red and white double daisies, stately crown imperials, violet, amber, blue, and white crocuses. Daphne Mezereum bushes should be in full bloom, often beginning in February; Forsythia viridissima will be covered with yellow bellflowers in sheltered wall angles or shrubbery nooks. The ordinary wallflowers will probably make the finest colour show, except for tulips of early varieties and golden narcissi; there should be carpets of forget-me-not beneath them, also around the pink Megasea cordifolia. M. H.

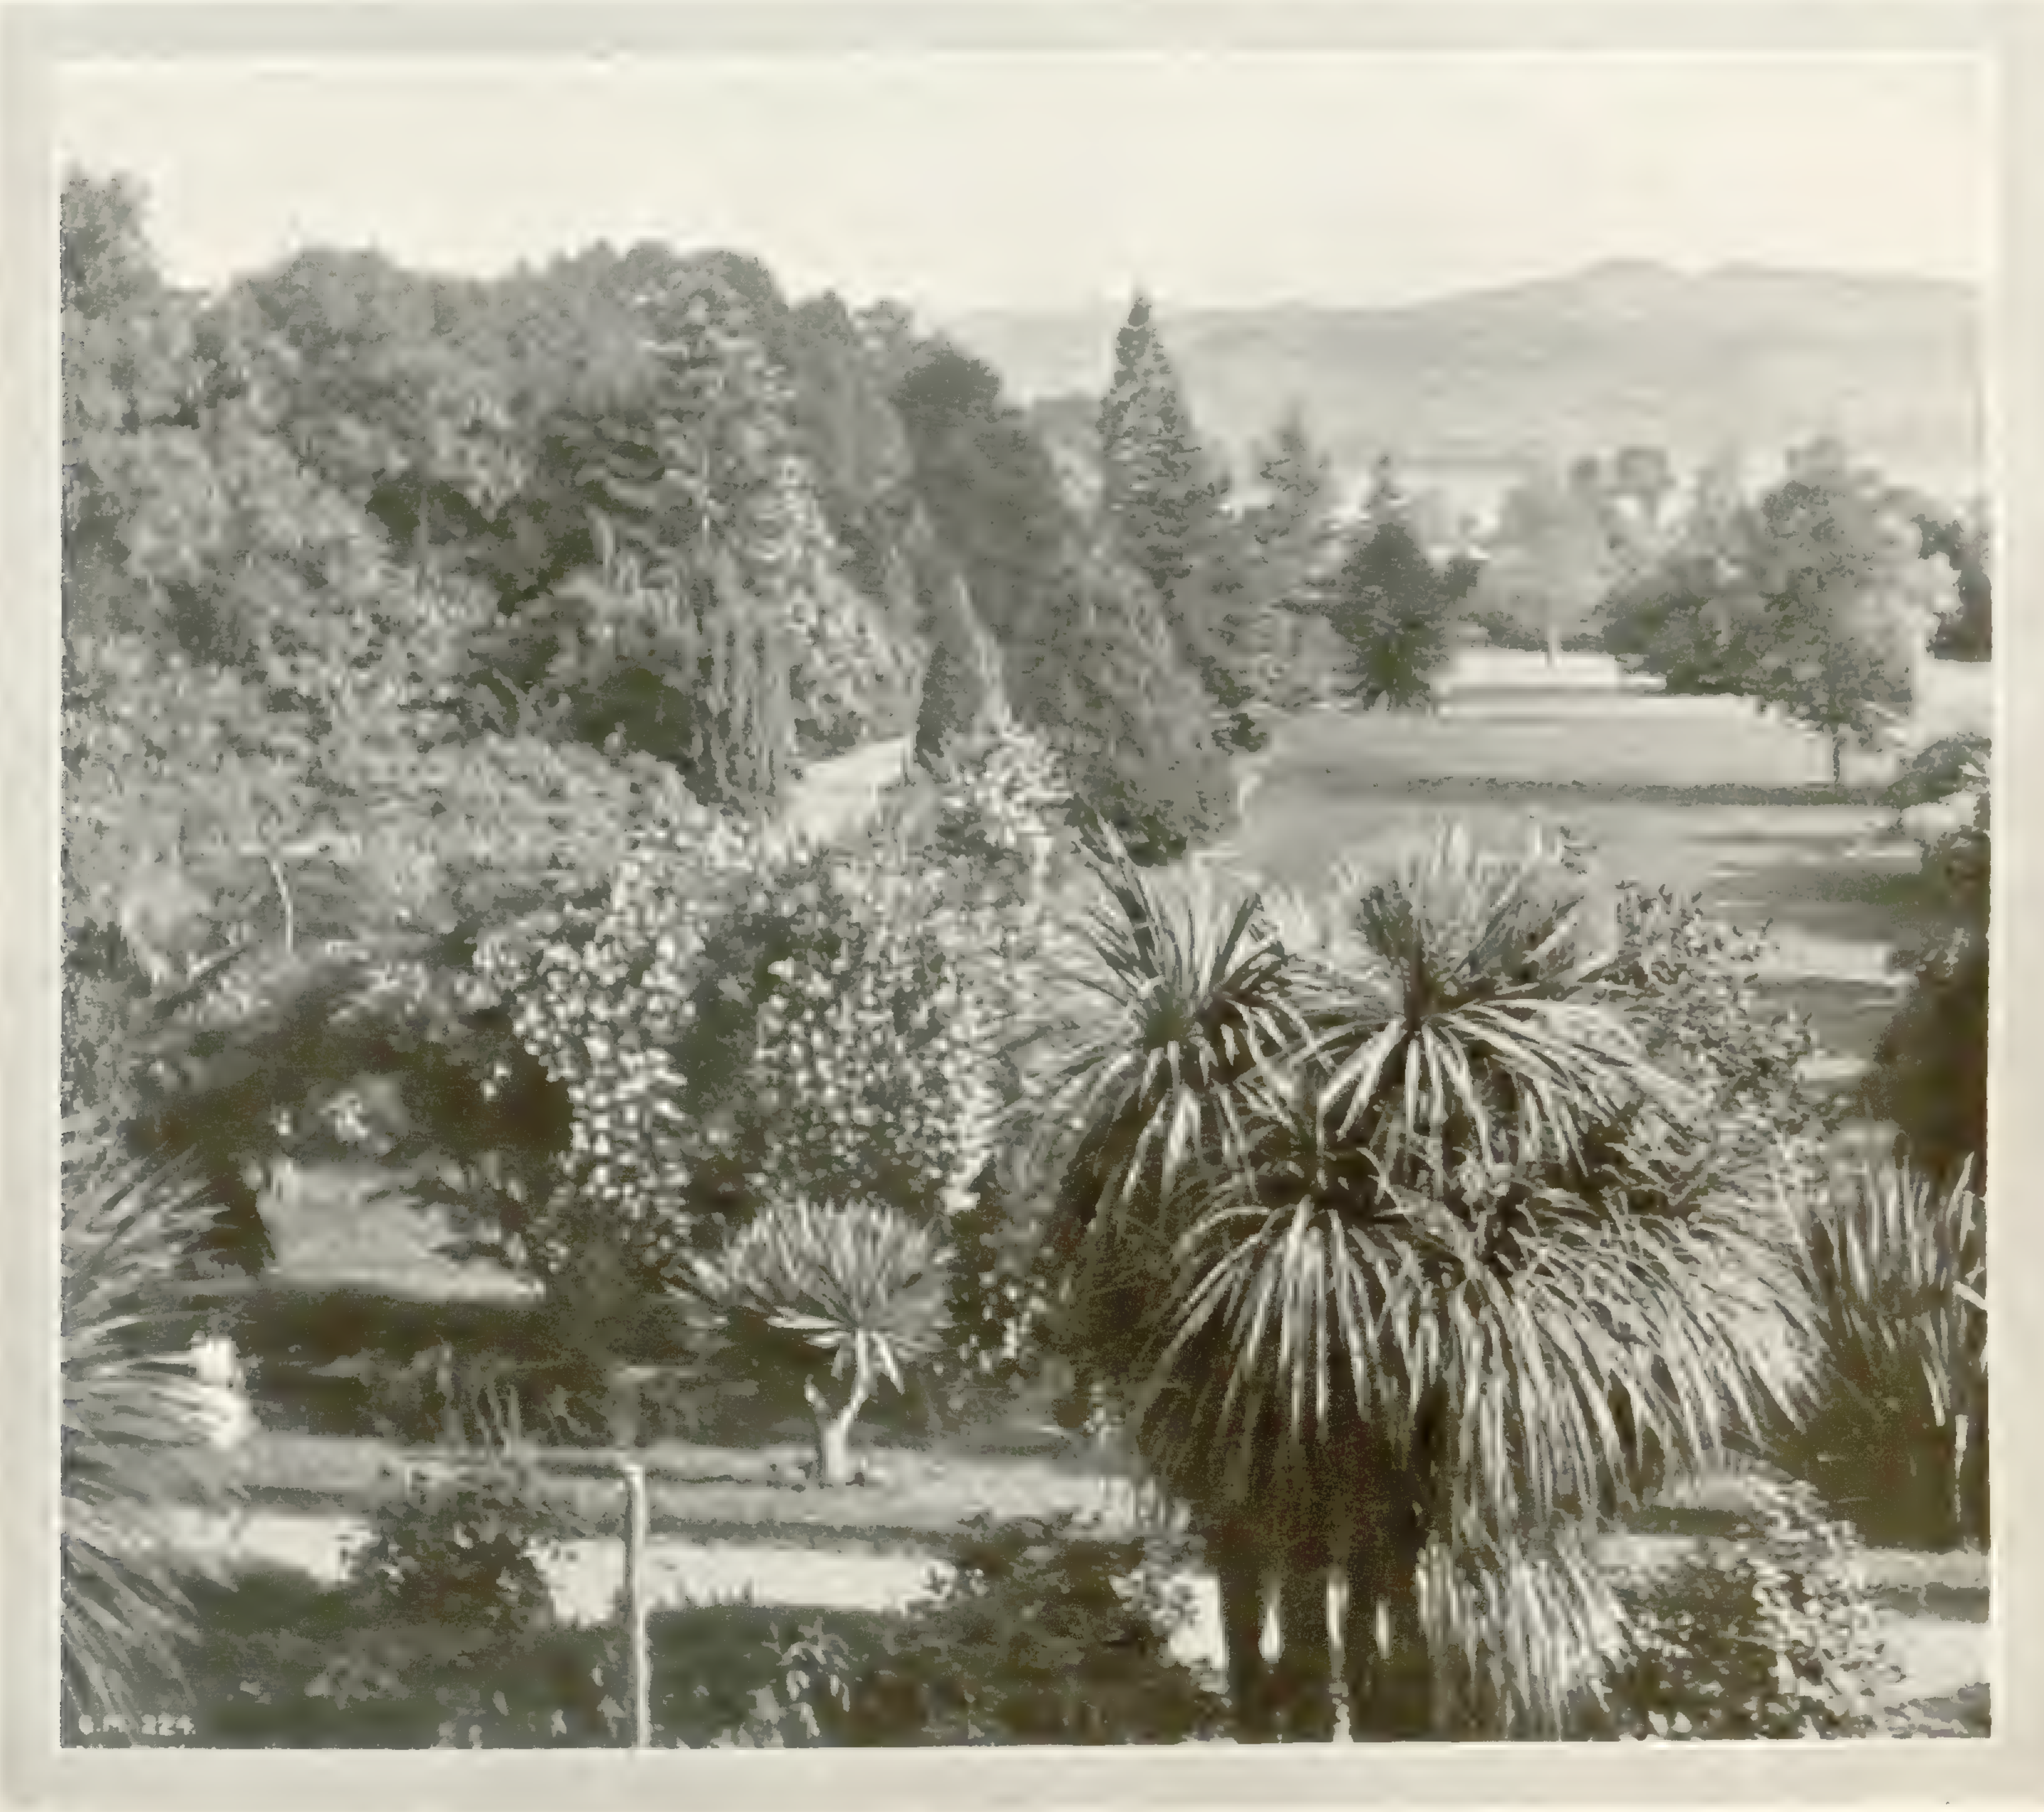
(To be continued.)

GREENHOUSE MANAGEMENT.—THE AMATEUR'S GREENHOUSE, the popular book by the Editor of "Amateur Gardening," not only treats of the selection and cultivation of greenhouse plants and flowers but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d. from THE GARDENERS' MAGAZINE Office, 148, Aldersgate Street, London.

SOUTH DEVON SCENERY.

On several occasions these columns have shown how widely different is the garden scenery in the South and South-west of England, from that of the North and North-east. Temperature and rainfall combine to make this great difference, or, rather, have combined in such a way as to suggest to plant lovers that many other than native plants might thrive therein, and probably many from countries regarded as distinctly warmer than our own. Experiments were conducted on a more or less systematic and extensive scale in these favoured districts long years ago, and probably in the olden times, when Devon and Cornish men were so greatly to the front as sailors and rovers, plants and seeds were brought from other lands and given a chance to live.

However that may be, in more recent times a considerable number of plant lovers have cultivated extra-temperate and subtropical plants in these warm districts with so much success that the face of Nature has been altered, for as the rarer plants have grown the commoner ones have been removed or used only for shelter. Thus it happens that in bonny Devon, along her sheltered sunny southern coast and inlets, one may find such scenes as that depicted in the accompanying illustration. This represents a view at The Moors, Bishops Teignton, near Teignmouth, and readers will readily distinguish the big cordylines (dracænas), bristling with flower spikes, great clumps of New Zealand Flax (Phormium tenax), the well known palm, Chamærops excelsa, tall graceful examples of acacias, giant Himalayan rhododendrons, the Chilian Araucaria imbricata, and several eucalyptus trees. Fuchsias, hydrangeas, pelargoniums, and many other subjects that are greenhouse plants in the Metropolitan district and northward, are here to be seen out of doors all the year round. A visit to these favoured spots during early spring would open the eyes of those who only know many of these and other trees and shrubs as pot plants.



VIEW IN THE GARDENS AT THE MOORS, BISHOPS TEIGNTON.

WISTARIA MULTIJUGA.

The value of the well known Wistaria chinensis as a free flowering climber is appreciated all over the country, and its useful and ornamental qualities have led to its cultivation almost to the exclusion of other kinds. There are, however, several other species which, if not quite so free flowering always, have a great deal to commend them, and the one under notice, W. multijuga, is of the number. It is a Japanese species, and is used largely in Japan as a cultivated plant, while the inflorescences are employed by artists as models for the ornamentation of chinaware and for painting on silk for screens, etc.

When allowed to grow freely it is quite as rampant as W. chinensis, but, like that species, it may be grown more or less as a bush by spurring the young growths in well each year, and securing the main branches to a stout stake. No very great difference is noticeable between the foliage of the two species, but in the inflorescence there is a marked alteration, for, while the racemes of W. chinensis rarely exceed nine inches in length, those of the Japanese species are frequently between three feet and four feet long. The colour in both cases is very similar. Though, as has been previously stated, it can be grown as a bush in the open, it also thrives well on a wall or fence, but it is probably at its best when grown over the top of a pergola, so that the long racemes of blossoms may hang over a pathway, a position where their full beauty can be appreciated.

It is not an uncommon thing for this species to produce fruits in this country. The pods are similar in form to a kidney bean, and range up to nine inches in length, the outer sides being covered with a fine silky pubescence. The seeds are rounded, and thin, and three to seven or so are usually found in each pod. Except by seeds it is a somewhat difficult plant to propagate: it may, however, be increased by means of layers, or it may be grafted on to pieces of root, as thick as a lead pencil, of the other species. Loamy soil suits it best, though it will thrive in that of a light sandy nature.

W. D.

Kew.

Cabbage.—The wet autumn and winter experienced so far has been very unfavourable to the main crop. Scarcely any growth has been made in this part. A sowing of an early kind will therefore be made under glass, and planted in cold frames.—George Ellwood, Swanmore Park Gardens.

SOME GOOD TABLE PEAS.

The number of varieties of culinary peas has very considerably increased during the last ten or twelve years, and the improvement in many is great. The white round-seeded have given way to green wrinkled and greatly improved flavoured varieties. I do not think much has been done in obtaining really earlier varieties, and this was not to be expected, as our climate will not permit this. Certainly some improvement has been effected in perhaps two or three varieties, but what has been accomplished is the immense increase in the crops, and in the size of pods of the early varieties.

The earliest that I have grown is Carter's Eight Weeks, which is a very hardy pea of the marrowfat type, and grows only fifteen inches high. Reading Wonder and Pioneer are a few days behind the first-named, but both these peas are of the very highest standard of excellence in our soil, which is rather heavy. Giant Lightning is a wonderfully improved pea, the pods being three times the size of the old type. Early Morn has stood the test now for ten years, and is a very fine early marrowfat pea that matures rapidly. Mayflower is a really good variety. Daffodil is a fine pea, and especially suitable for small and intermediate gardens, as very small sticks only are required. I prefer to stick all peas, as I think they have then a better chance of development. International is a distinct pea that gained much popularity last season, and proved to be large, of excellent flavour, and a good grower. Daisy is still a good reliable variety, and Buttercup is a fine type of pea both in cropping and flavour.

Harvestman is a new and promising variety of the highest standard. Dreadnought and Quite Content have now become household words, as it were, amongst growers; the latter requires plenty of time, and should be grown in single rows, apart from any others, or it becomes drawn, and does not fill up so well as it otherwise would. Michaelmas and Late Queen are decidedly the best of late varieties, though on some soils I have seen Autocrat give extraordinarily good crops.

There are so many really good peas now to select from that it is sometimes puzzling for the beginner to select, hence these notes. All peas require deeply dug or trenched ground that has been heavily manured. On light soil I prefer trenches, treating the trenches as is usual for celery. Tall-growing varieties should stand out in single rows, and not in plots; indeed, it is better at all times to adopt this method if the convenience and ground be at disposal, and it is as well to remember that there are some garden crops that delight in a little shade during midday; the peas would give this.

Leonardslee Gardens. W. A. Cook.

Asparagus. — Where there is the convenience for forming gentle hotbeds it is very easy to obtain supplies of this vegetable. If beds have been made as advised in an earlier calendar, place four or five inches of compost in the bottom of the frames, and this should consist of equal parts loam, leaf-soil, and spent mushroom bed. Place thereon the roots, laying them thickly over the soil. Cover them with four or five inches of similar soil. Give a good watering to complete the operation. Keep the lights closed unless the temperature should rise above 65 degrees, when a little air should be admitted; close early and syringe on all favourable days.—G. E.

SELECTING CUTTINGS OF PERPETUAL-FLOWERING CARNATIONS.

In the propagation of the perpetual-flowering carnation there are two debatable points, viz., the best time to insert cuttings, and the correct kind of cutting.

In years past autumn-rooted cuttings were looked upon by some as being superior to winter cuttings, and in the case of the old English tree carnation this may have been so, but all the best wholesale growers, both in this country and America, are agreed that December is quite early enough to commence propagating the modern perpetual flowering carnation, and I maintain that finer and better plants are procured from stock propagated in December, January, and February than from cuttings rooted from September to November.

The reason why this should be so is quite easily explained. The one stage in the life of a young carnation at which it is in its weakest state, is when it is emitting roots. It will then have almost exhausted its strength during the operation, and hence will require favourable climatic conditions to recuperate and start out upon its new life. Those of us who watch plant life closely know how, in the early days of January, there comes that re-awakening into a stronger growth, which is particularly noticeable in the perpetual-flowering carnation. This fact itself must be, and indeed is, a factor greatly to be considered. Whereas, on the other hand, a cutting inserted and rooted during September has two dull, dreary months before it, from a growing point of view, just at the critical time when it most needs assistance. Many I know place these autumn-rooted cuttings on shelves in a moderately warm house, and so encourage them to grow, yet this is a poor substitute for Nature's own persuasive way, and growth so made is weak, and is certainly not a suitable foundation upon which to build a strong vigorous plant. The root action is also naturally slow and weak, hence a lighter soil has to be used, and too often the plants become hard, and it is March before they make a strong clean growth.

We may deceive ourselves, but we cannot deceive Nature. Spring is the season of the year when nearly all plants make their natural growth in preparation for the following winter, and we can but have our young plants rooted in a fit condition so as to respond readily to her early call. I feel I cannot write too strongly, or emphasise too emphatically the vital importance of only selecting the very best and strongest cuttings. We know how fully the seedsmen realise the importance of selection of seeds and how quickly the true type is lost unless this selection is carried out. Like produces like, not only in colour, habit of growth and formation of flower, but in vitality and constitution. If we propagate cuttings from diseased parents we propagate disease. Not only is this true of plants in ill-health, but if the parent plant has been weakened by forcing or irregular treatment, then the offspring or cutting must suffer from such weakness.

Select as parent plants those of the true type, pure in colour, and free and vigorous in growth, avoiding plants which have produced flowers with split calyx or weak stems. The stock or parent plants should be grown cool in a good light and under normal conditions, and should be plants that have not been fed to excess; understand, however, that I would not advise anyone to allow the stock plants to become checked owing to the lack of sufficient food. In feeding avoid fertilisers with any chemical element, using a pure natural manure, one that is more a food than a stimulant, and will build up the plant. Cuttings from such a plant would be strengthened rather than weakened.

The correct cutting of the perpetual-flowering carnation is undoubtedly that which is produced from the flowering growth. This may be in a fit state to remove just as the bud is showing colour, or after the flower has been cut. It can be taken, as a rule, that the cutting should be in a half-matured state when removed, and some two and a-half inches long. Each flower growth, taking the average variety, well grown, should produce three good cuttings; odd kinds produce more, others less. The very top cuttings which have a stem before the first set of leaves should be avoided, also the one or two small slow-growing cuttings at the base of the flower stem.

The correct cutting is found between these two opposite sets of cuttings, they being produced on the parent flower growth where the growth is thickest, and where there is a short space between the leaves, whilst they have practically no space at all between their leaves.

Montagu C. Allwood.

SOPHORA VICIIFOLIA.

Until quite recent years one species only of Sophora was known that was suitable for outdoor culture in gardens other than those in such mild climates as Devonshire and Cornwall. Ten or twelve years ago, however, another hardy species came to light in S. viciifolia. Like the older species of S. japonica, it hails from China, but here the comparison ends, for it is as unlike the well-known autumn flowering tree as it can well be, as it is of bushy habit and of low stature, whilst S. japonica forms a large tree, with a trunk of considerable size.

The leaves are small and pinnate, and are borne on somewhat spiny branches. The flowers appear from buds in the axils of the leaves in July and August. They are white in colour, tinged with violet. It is an exceedingly free flowering shrub, and is an excellent subject for a small bed on a lawn, or it may be trained against a wall. Cuttings of half-ripe wood root fairly well in sandy soil, either in a warm propagating case or in a cold frame. Like other allied shrubs, it succeeds in loamy soil, and is a rather difficult subject to transplant after it has attained five or six years of age, for, as in the case of other leguminous shrubs, branch growth is frequently out of all proportion to root growth, the roots being confined to two or three long ones with a very small amount of fibre. W. D.

Hop Shoots as a Vegetable. —In the spring when the hop plant begins to throw up shoots, it is customary in this country to thin out and throw away the shoots, leaving only two or three to each plant. In some Continental countries, however, these hop shoots are used as a vegetable, being gathered when from four to five inches long, and boiled and eaten like asparagus. They are most largely employed in this way in Belgium, where, according to information furnished by the Ministry of Agriculture, the shoots are gathered from about 2,500 acres of hops. The average production is about 70lb. per acre. They are sold fresh, and are also supplied to preserving factories. They are among the earliest spring vegetables, and appear on the bill of fare of all the large restaurants in Belgium from the beginning of March.

SPECIAL REDUCTIONS IN PRICE OF RHODODENDRONS, etc.

We hold the largest Stock of **RHODODENDRONS** in Great Britain, all extra fine, bushy stuff, grown 1,000ft. above sea-level; being recently transplanted are in a splendid condition for removal. Special reduction will be made to clear land of the following:—

RHODODENDRONS, which can be supplied by the hundreds of thousands, in sizes from 1ft., 1½-2ft., 2-2½ft., 2½-3ft., and 3 to 4ft., by the doz., 100, or 1,000 to suit purchasers. **PONTICUMS, HYBRID SEEDLINGS, BLANDUM, CAUCASIAN PICTUM, CUNNS** (white and blush), **JACKSONII,** choice named varieties; extra fine, clean stuff.

AZALEA PONTICUM, 1 to 4 ft., extra fine.

CUPRESSUS, in all varieties, from 2 to 6 ft.

HOLLY COM., from 1, 2, 5, 6, 7, 8, and 9 ft. high; extra fine. **HOLLY HODGENSI, MADERIENSIS,** and **SHEPHERDI,** in all sizes.

LAURELS in variety, from 2, 3, 4, 5, 6 ft. high.
YEWS, ENG., from 1, 2, 3, 4, 6, 7, and 8 ft. high; extra fine stuff.

ORNAMENTAL TREES, FOREST TREES, PLANTS FOR HEDGES, GAME COVERTS, ETC., in large quantities.

We extend a Courteous Invitation to Inspect our Nurseries, 300 acres in extent.

TWERTON HILL NURSERY, BATH.

SWEET PEAS IN POTS.

The cultivation of many kinds of hardy annuals in pots for conservatory, greenhouse, or home decoration is spreading in a wonderful way, and this is not to be wondered at when we remember that the expense entailed is quite small. Some amount of time and care must be spent in producing results worthy of consideration, but these are such as most amateurs who love flowers can readily give. In their earlier stages of growth sweet peas in pots need the shelter of a cold frame, and subsequently a cool greenhouse is necessary if rather early flowers are desired, but if the aim is to bring sweet peas up to or into the house at sweet pea time then no shelter beyond that of the cold frame is needed, because the pots may be stood out of doors when the plants are too tall for the frame.

Eight-inch or nine-inch pots will be large enough for most purposes, and three plants in each pot will be ample. Substantial loam with some old manure added will suffice for potting compost, but will be improved by the addition of a little bonemeal. Watering is an important matter when the pots are filled with roots, and as large quantities of water will be necessary the free use of weak liquid manure is an important item when flowers are being produced.

For verandahs and balconies, as well as for the situations and purposes already suggested, sweet peas in pots prove very useful, while for small gardens sweet peas in pots or tubs are delightful. An advantage with sweet peas in pots is that the highly-coloured varieties may be placed in positions where the sun will not affect their brilliance.

Most varieties are suitable for pot culture, but a few may be mentioned as having proved particularly useful under this method. These are Countess Spencer, Etta Dyke, St. George, Miss Willmott, King Edward, A. J. Cook, Mrs. Hardcastle Sykes, Lady Grisel Hamilton, Clara Curtis, Helen Pierce, Dora Breadmore, John Ingman, The Marquis, and Mrs. C. W. Breadmore. Most of these we have seen growing finely in pots in a small suburban backyard, and most of them were represented in the beautiful group of sweet peas in pots set up at the great Holland House Show in July, 1909, by Messrs. James Veitch and Sons, Chelsea, an illustration of which we give in the present issue.

GROUP OF SWEET PEAS IN POTS EXHIBITED BY MESSRS. JAMES VEITCH AND SONS, LIM., AT HOLLAND HOUSE, IN 1909.

ANTIRRHINUMS.

In one form or another Antirrhinum majus and its varieties are indispensable subjects for garden decoration, the dwarf kinds being extremely serviceable in beds and borders, while from the taller varieties we secure an almost unlimited supply of material for cutting.

Under favourable conditions Antirrhinum majus is perennial, but in the majority of gardens it is more or less crippled during winter, consequently the best results are obtained by treating it as an annual or biennial. Seed may be sown late in the autumn, in the winter, or early in spring, transplanting the seedlings into boxes, growing them under cool conditions, and, after careful hardening off, planting them in their flowering quarters on the first favourable opportunity during April.

Antirrhinums will often succeed under indifferent conditions, but to obtain good results a medium rich soil should be provided, fresh manure ought to be avoided, giving preference to that which is well decayed, and, when at all possible, prepare the ground some time in advance of planting. Seedlings transplant readily, and where firm planting is practised the plants will generally reach their highest floral development. Antirrhinums withstand drought without apparent injury, so that watering or assistance from stimulants is scarcely called for. Their cultural requirements are confined to supplying the necessary stakes for supporting the stems of the taller varieties, and in the early removal of all spent flowers and seed pods.

During recent years English seed houses have directed their attention to the selection of varieties having self-coloured flowers, so that it is now possible to employ these for bedding or in colour schemes without fear of an unsuitable mixture appearing to mar our results. For bedding purposes the Tom Thumb varieties are most useful, as the plants are uniform in height and breadth, seldom exceeding nine inches. When at their zenith they appear as compact masses of blossom, supported by a retaining circle formed by the deep green foliage. Employed by themselves, these Tom Thumb varieties are too stiff and formal, but when used as a groundwork to some taller plant the result will be so much more pleasing. Varieties of intermediate height rise to about eighteen inches, and are less stiff in outline than the Tom Thumbs, while the colour range is also wider; they commend themselves as groundwork plants for large beds or borders, either employed alone or in conjunction with taller subjects. The tallest varieties reach a flowering height of three feet, and as the lateral branches originate almost directly above the ground level, it is possible to secure a good length of stem, a circumstance which enhances their value when the flowers are employed for decorative purposes in a cut state. In every case the flowers are large, and last well, and it is no uncommon experience to find plants coming into flower during June retaining their decorative value until October. As pot plants antirrhinums give excellent results when grown under similar conditions to the schizanthuses, seed sown in autumn will produce flowering plants in March and April.

Like the common foxglove, the antirrhinum often becomes self-sown in the crumbling courses of walls or upon dry stony banks; under these conditions it varies considerably both in height and in size of flower, although the character of the plant generally gains in beauty from its picturesque setting. Similar conditions not infrequently come under the gardener's care —particularly in old-world gardens—and if seedlings or seed be introduced, and cared for until firmly established, few plants will yield more permanent results, coupled with beauty in a high degree, than the various forms of Antirrhinum majus.

Thomas Smith.

Walmsgate Gardens, Louth.

WEATHER AT ROTHAMSTED IN 1909.

The meteorological records of the Rothamsted Experimental Station, Hertfordshire, for 1909 show that the year was characterised by its cold and wet nature, with, upon the whole, a more than average amount of sunshine in this district. The cold was most marked during the five months May to September, which includes most of the period of active plant growth. In fact during these months the only spell of warm seasonable weather was in the first half of August. The most unseasonably cold month of the year was June, which recorded 4.4 degrees less than the average warmth extending over the past fifty years. The most unseasonably warm month was October, recording 3.3 degrees above average.

There were thirteen nights of frost in January, registering an aggregate of 72 degrees.

February, with twenty-two nights of frost, gave a total of 127.3 degrees, the extreme of cold occurring on the 22nd and 23rd of the month, when 12.6 and 14.5 degrees of frost were recorded respectively. March gave fourteen nights of frost, totalling up to 76.4 degrees. April, with nine nights of frost, registered a total of 17.2 degrees. May recorded five frosty nights, giving an aggregate of 7.5 degrees.

From this data it is seen that the first five months of the year recorded the remarkably large total amount of 300.5 degrees of frost.

The winter months of October gave on three nights an aggregate of 6.5 degrees of frost; November, on eleven nights, recorded a total of 26.4 degrees; and December, with twelve nights of frost, gave a total of 58.4 degrees.

There were nineteen falls of snow during the year, the greatest depth of about six inches occurring in March. The total rainfall for the year, including the minor deposits of dew, frost, and snow, was nearly two inches in excess of the average of the past fifty-six years at Rothamsted. There were six months of excessive rainfall, and six months of deficiency. The total number of rainy days was 195, being twenty-three days in excess of the average, and eleven days more than in the previous year of 1908.

The bright sunshine showed seven months in excess and five months deficient. The sunniest month of the year was May, when the record of sunshine exceeded the average by 103 hours. Taking a summary of each month of 1909, we find that January gave twenty-three hours more than average sunshine, slightly over average mean temperature, but 1.38 inch less than average rainfall.

February gave twenty-two hours' excessive sunshine, 2.7 degrees deficient temperature, and 1.36 inch deficient rainfall. March recorded fifty-one hours deficient sunshine, with 2.6 degrees deficient warmth, but 1.88 inch excessive rainfall. In fact, it was most probably the heavy rainfall of March which was responsible for the growth of the hay crops, and assisted the wheat crops in making a successful start. Previous to this it was a question whether large areas of wheat would not have to be ploughed up for lack of a sufficient plant. April recorded 71 hours excessive sunshine, 1.9 degree extra warmth, and just under average rainfall. May gave a total of 297 hours of bright sunshine, being 103 hours above the average record, but owing to the unusually cold nights the mean temperature was rather under average, the rainfall being also below the average amount.

June was cold and sunless, with an excessive rainfall. The sunshine was eighty-eight hours deficient, the mean temperature 4.4 degrees less than usual, but the rainfall 1.7 inch in excess. July also gave thirty hours deficient sunshine, two degrees less than average warmth, and half an inch excessive rainfall. August gave twenty-two hours of sunshine above the average, with exactly the average mean temperature, and slightly over average rainfall.

The grain crops were about three weeks late in this district, but little corn was cut until the last week in August. September was a gloomy month, recording fifty-three hours deficient sunshine, 2.1 degrees deficient temperature, and nearly half-an-inch less than average rainfall. October gave nineteen hours deficient sunshine, 3.3 degrees excess of warmth, and over five inches of rain, being the heaviest total monthly rainfall of the year, showing two inches in excess of the normal amount. November registered thirty-two hours excessive sunshine, 2.3 degrees less than average temperature, and 1.32 inch below average rainfall. December recorded sixteen hours excessive sunshine, 1.2 degree above average temperature, and more than one inch excessive rainfall. The total rainfall for the year was thirty inches, being about two inches in excess of the average of the past fifty-six years at Rothamsted. The total sunshine amounted to 1,652 hours, being forty-seven hours in excess. The mean temperature for the year was 47.1 degrees, being 0.8 degree below the usual average.

The total rainfall for the last three months of the year exceeded the average for the same period in the previous fifty-six years by 1.83 inch—which is equivalent to an excess of 41,402 gallons of water on each acre of land; last year at the same time there was a deficiency of 76,197 gallons on each acre in the underground water supply of this district.

Harpenden. J. J. WILLIS.

ROSE MOLLY SHARMAN CRAWFORD.

A tea-scented variety; eau-de-nil white. Raised by Messrs. A. Dickson and Sons, Newtownards.

ROSE MOLLY SHARMAN CRAWFORD.

Raised by Messrs. Alex. Dickson and Sons, of Newtownards, and introduced by them in 1908, Molly Sharman Crawford has rapidly passed into a high position among tea-scented roses. It is a vigorous growing variety suitable alike for exhibition, for the garden, and for culture under glass. The blooms are of fine size, full, and with broad petals, and the colour is well described as eau-de-nil white. This tea variety was shown well on several occasions during the summer of 1909. In the year it made its début, Molly Sharman Crawford secured an Award of Merit from the Royal Horticultural Society, and on that occasion, July 7, 1908, its full, high-centred blooms, exquisitely fragrant, attracted a great deal of attention from the large number of rosarians who saw it.

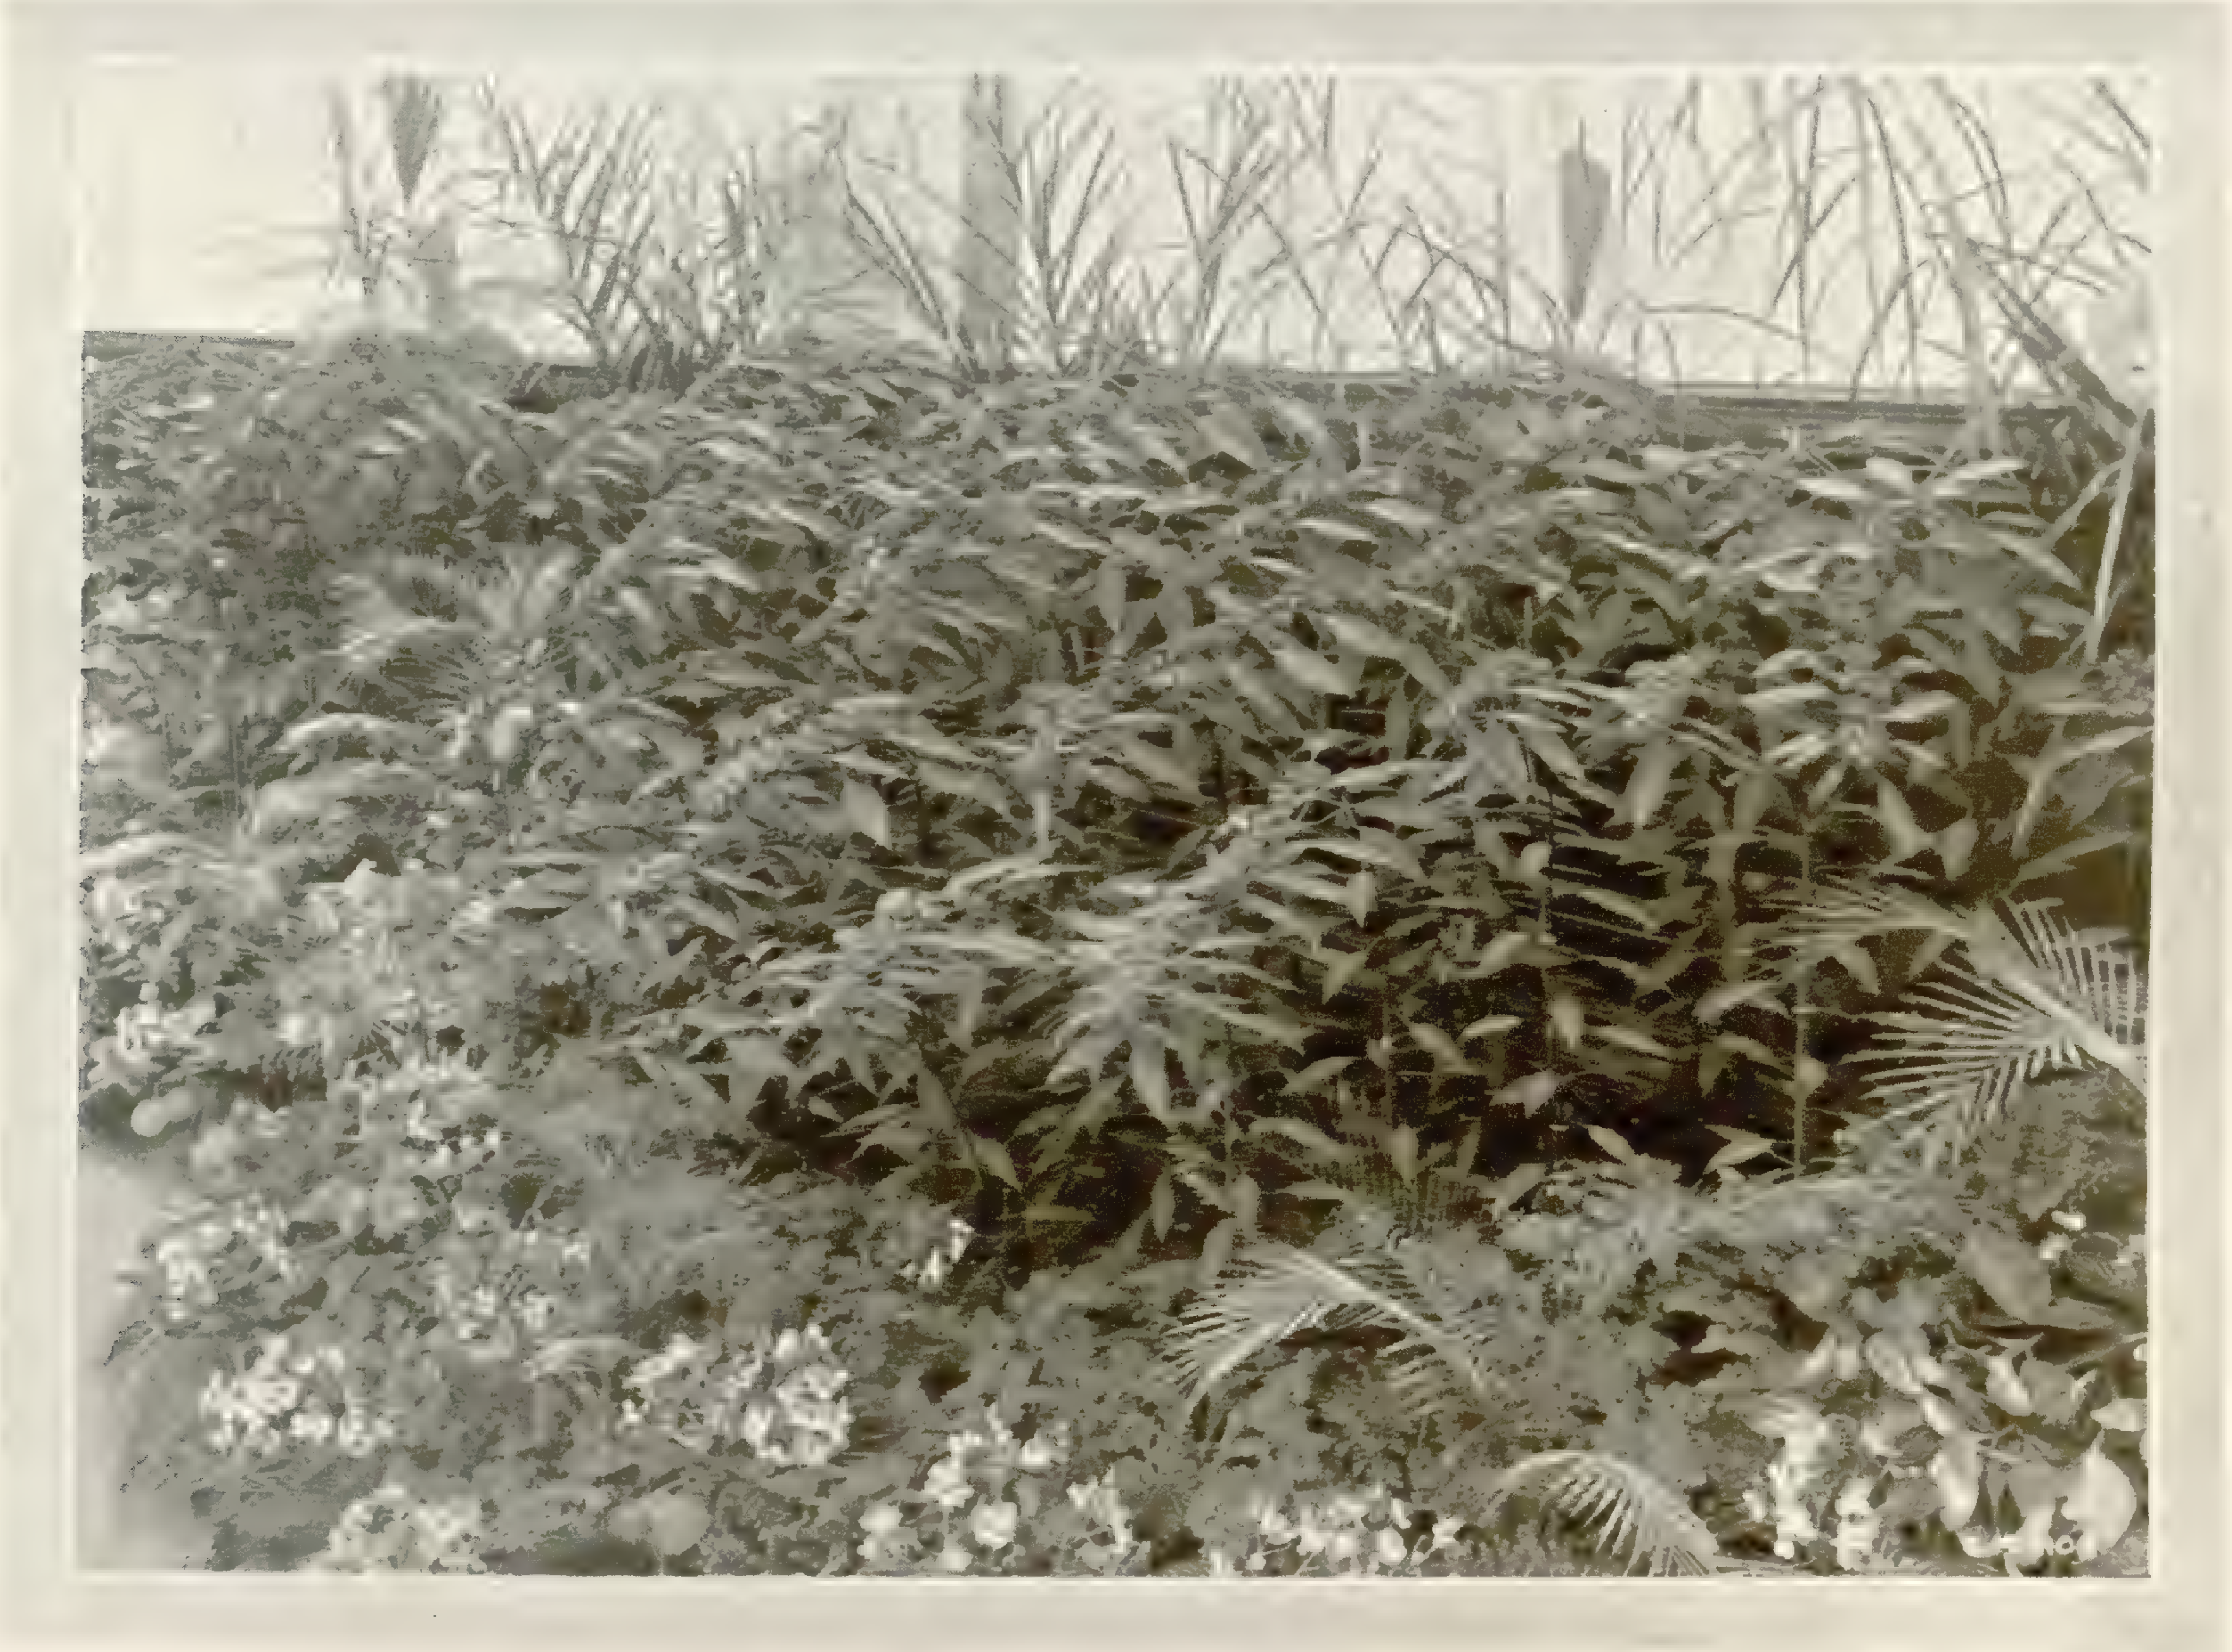
EUPHORBIA JACQUINIÆFLORA.

The highly effective group of this brightly coloured euphorbia that was exhibited by Mr. Prime, the able chief of the Hatfield House Gardens, at the meeting of the Royal Horticultural Society on the 11th inst., served to remind us once more of its usefulness in winter decoration. This group, however, did something more than this; it contributed materially to the attractions of the general display, it afforded an excellent object lesson, and the individual plants set up a standard which cultivators should endeavour to follow. It can be seen in glancing at the accompanying illustration that the plants were well grown and finely flowered, and that the arrangement was tasteful, but colours other than black and white are necessary to convey a really adequate idea of the effect produced. The colour of the flowers is, it should be said, brilliant orange, and of a depth that would justify it being described as orange-scarlet. As will be seen the flowers are arranged along the upper side of the elegantly arching stems, and with their background of bright green leaves can be utilised in decorations of the most divergent character.

It may be of interest to recall the fact that Euphorbia jacquiniæflora is a native of Mexico, and to state that it was introduced to British gardens about seventy-three years ago. The first figure that was published in this country was in the volume of Paxton's "Magazine of Botany" for 1837, and this is of great excellence. The plant from which the spray illustrated was obtained was growing in the collection of Messrs. Luccombe Pince and Co., of Exeter. In this publication the plant was figured under the name of Euphorbia fulgens. A year later it was figured in the "Botanical Magazine" (t. 3,675) under the name of Euphorbia jacquiniæflora. Since that time the plant has received a full share of attention in gardening literature, and scores of articles must have been written explanatory of its cultural requirements.

These, it must be said, are of the simplest; but simple as they unquestionably are, they must be complied with. Were one to summarise, it might be said that the main essentials are early propagation, a brisk temperature, and a light position, with rather liberal supplies of water. The first step in raising a young stock is to cut the old plants back when their flowers have lost their beauty, and keep them rather dry for a time, and thus assist the wounds to heal over. With a temperature of about 70 degrees new growths will soon appear, and when three or four inches in length they should be taken off close to the old stems and utilised in the increase of stock. Sand is preferable to soil for rooting the cuttings, and they may be put singly in small sixties or four or five in five-inch pots. Those rooted singly will require shifting on until they reach five or six-inch pots, according to their vigour or the purpose for which they are required. The others are potted off singly, and shifted on until they reach pots of the sizes mentioned, but if rather large specimens are required they can without being divided be shifted into eight-inch pots. An excellent compost is one consisting of three parts each of peat and fibrous loam, and one part each of leaf-mould and silver sand.

When grown in a mixed collection where it is difficult if not impossible to give them a position near the glass, the results are seldom so satisfactory as could be wished. The best place for them is a spacious heated pit where they can at all stages be within a short distance of the glass, and enjoy uninterrupted light, except when a light shade is considered advisable. Here they should receive rather liberal supplies of water when they are becoming pot-bound, with an occasional supply of liquid manure of a moderate degree of strength. The pit should be moderately ventilated, and when it is closed in the afternoon a light overhead syringing will be beneficial. Here we have the code of culture in a nutshell, and, if anything further need be said, it is to suggest that overcrowding should be avoided. G.



AN EFFECTIVE GROUP OF EUPHORBIA JACQUINIÆFLORA
With a margin of Saintpaulia ionantha, exhibited by Mr. Prime at R.H.S. Meeting, January 11.

RUSCUS HYPOGLOSSUM.

This is a useful dwarf-growing shrub suitable for carpeting ground beneath some taller-growing subject; for forming an undergrowth in a plantation, or for planting as an edging to a path. It is much dwarfer and neater in growth than the Butcher's Broom, Ruscus aculeatus, and may be readily distinguished by its broad leaf-like branches. It is a native of Southern Europe, and grows from six to nine inches high. The flowers are very small, and the fruits red, but it is not often the latter are borne in quantity, though when such is the case they are very effective.

It may be easily increased, for if an old plant is taken and divided up into small pieces, and each piece with a bit of root is potted up, they quickly re-establish themselves, and grow into fine clumps. Light or heavy soil appears to suit it, but a hot, dry position should be avoided, for, like the common ruscus, it is subject to scale if growing in a very sunny or dry situation. W. D.

SOME DWARF STONECROPS.

The species of sedums, or stonecrops, in cultivation are now very numerous, and one cannot in the space available for these notes enter upon a complete review of the genus, or even of those which we should class as of dwarf growth. There are, however, a considerable number of species of almost similar character which may well be grouped together for practical purposes. These are those of much the same habit as our common native species, S. anglicum and S. acre. These are so well known that they will be useful as giving an idea of the plants to which I now refer.

The stonecrops of this character have numerous uses in the garden, and, also, it may be said, in places which do not properly come under the category of gardens.

In the garden many may be used as carpeters for bulbs and other plants which do not shade the ground underneath densely, and which may leave it barer than is desired when their period of bloom is over. They are eminently suitable for early-flowering bulbs, and their low habit and shallow rooting give them a value few other perennial carpeters possess. On the rockery they can be employed with the happiest results, either as carpeters or by themselves, to form little groups, to cover dry ledges, or to plant between the crevices of the rocks, or between the stones of a rocky pathway.

Their ultra-garden uses will be manifold, as they may cover a roof, may be planted in or on some old wall, may be employed to cover some bare spot in poor soil, and in full sun, where naught but the most heat-resisting plant will survive. The majority of the sedums here referred to are hardy, while all are beautiful enough, and will well repay the closer study of the lover of plants by their beauty, which is greatly increased if the microscope is applied to the examination of the plants and flowers.

Sedums acre, aureum, and elegans.

It is unnecessary to do more than refer to the common Sedum acre, which, in masses, is such an ornament of some of our sea coasts, but which in some places becomes a troublesome weed. It is very handsome where it flowers well, with its golden flowers almost covering the low-growing plants. In its two varieties, however, we have good plants for several purposes. These are S. a. aureum, with golden foliage, and S. a. elegans, which has this of a pretty silver and green. They flower less freely than the type, but their beauty is so great in itself that they should not be neglected.

Sedum album.

This stonecrop is just a little difficult to classify with the objects of these notes, but in poor soil it will not much exceed the three inches or so one would prefer to make the limit of our choice. Grown on a roof or a wall it is closer habited, but I have it here at present some six inches high. On the roof it is excellent, but on a border or a rockery it has a tendency to become too coarse. It has rather thick and fleshy leaves, blunt at the top, and masses of little white flowers. There are several varieties, such as formosum, turgidum, pallescens, and virens. This is a very easily cultivated species, and one which will grow with the merest modicum of soil.

Sedum anglicum.

This hardly calls for notice, although it is not to be found in a wild state everywhere, and it has been proved difficult to keep alive in cultivation. It likes a very sandy soil, with full exposure to the sun, and is a truly pretty little species, with its white or rosy-white flowers on low masses of leaves of cushion-like appearance.

Sedum brevifolium.

This species and its varieties include what are almost the most desirable of the stonecrops of the class referred to in these notes, their beautiful foliage endearing them to all, while the flowers add still more beauty to plants which are charming in themselves. The type, S. brevifolium, is well called the "mealy stonecrop," from the ovoid pinky leaves, prettily arranged on the stems, and quite covered with a meal-like pubescence. The flowers are whitish. There is a variety of larger growth, but still neat, called major, but the gem of the set is Pottsi, which was, I understand, introduced by Mr. Potts, Fettes Mount, near Edinburgh. It has small leaves, prettily coloured with white and chocolate-red. One finds these brevifolium varieties a little difficult to keep in some changeable winters, but it is not rain which causes their loss, as even Pottsi is known to thrive well in wet parts of Wales.

Sedum dasyphyllum.

The daisy-leaved stonecrop much resembles S. brevifolium, and has its leaves prettily coloured also. Its flowers are more of a pinkish colour. The pretty variety called glanduliferum, also known as S. corsicum, has its leaves closely covered with very short hairs. Both of these are very desirable rockery plants.

Sedum Hispanicum.

This diminutive species is often called S. glaucum, but other authorities call it by the title here chosen. It has pretty little pinkish flowers, and its small leaves are of a charming grey-green, afterwards becoming rather reddish in hue. A beautiful little species, this is easily grown on a dry and sunny place. There is a yellow-leaved form called aureum.

Sedum lydium.

The last I purpose naming at present is S. lydium, a very attractive little species, and one of my favourites. It is a rapid, but not obtrusive grower, and makes tufts or carpets of vivid green foliage, afterwards becoming bright red towards autumn. In very dry places, such as on walls, it assumes the red colour much earlier than on the ground. It does not bloom so freely as the others, but sends up here and there over the carpet of green short, stout stems carrying a number of little pinkish flowers. It is one of the hardiest and most satisfactory of its class, and never fails to please all who grow or see it.

Cultivation.

One might have referred to several others of the same class, but one must pass to the question of cultivation, which requires but little detail. Practically all the species will grow in any light soil, but in some places it is necessary to add plenty of stones and grit, and some, such as S. acre, apparently delight in calcareous matter, such as broken shells or old mortar. One finds that this assists flowering, and checks rampant growth, although few of these species are guilty of this. On old walls and roofs an inch or less of soil will be sufficient, indeed one has planted them with less than a quarter of an inch of earth between their roots.

S. Arnott.

Sunnymead, Dumfries.

ORCHIDS FROM SEED.

It is a general practice among orchid raisers to keep in store until the turn of the days any seed pods that may ripen during the late autumn and winter. In the case of cattleyas, their allied genera, and most of the epidendrum group, this is good practice, but after the middle of January the earlier the seeds are sown the better. The increasing light, with suitable atmospheric conditions, will generally assist rapid germination, and where seeds are sown early there is less watering required than is the case if there is delay for a few weeks.

Those who are largely engaged in orchid cultivation have generally proper facilities for raising seedlings, and it is, therefore, to those who labour under less favourable conditions that I chiefly address my remarks. Experience has taught me there is no greater difficulties in raising orchids from seeds than is experienced among most other plants, and as a further encouragement I would point out that where the parent species or parent plants can be successfully grown, there should be no difficulty in germination, and in rearing the seedlings from them.

I am quite willing to admit there are considerable advantages in the early stages of growth where plants are assisted by up-to-date conditions, but the principal advantage that can then be claimed is the shortening of the period between seed sowing and flowering.

When sowing dendrobiums, cattleyas, epidendrums, sophronitis, etc., etc., the seeds may be sprinkled thinly over the surface of moderately fresh potting compost containing plants of the same kind as the seed; all moss and material that would be likely to overgrow and choke the seedlings should first be carefully removed. Care must be observed to avoid washing the seed from the surface when giving water to the plants, as there can be no question that carelessness in watering, rather than any other cause, brings failure. The seed is so light that it is easily floated from the surface in the early stages, and carried over the sides of the receptacle, and thus destroyed.

A better method than sowing on the surface of the potting compost is to procure some pieces of linen, or strips of new No. 5 shading, such as is in common use for blinds on the roofs of the houses. Cut the pieces into seven-inch or eight-inch squares, spread one over the palm of the hand, and in it place some chopped sphagnum, mixed with a little sand, then by wrapping the edges of the linen tightly round the sphagnum, make the whole into a ball. Some suitably sized clean pots, that have been filled to about one-half their depth with drainage materials should have the linen-cased ball of sphagnum placed in the centre; then fill firmly round the edges with finely chopped sphagnum to prevent the edges of the cloth from being raised up and the seeds being washed into the drainage. Water these with tepid rain water a few hours before the seed is sown. Sprinkle the seeds over the surface, and place in the warmest and most humid situation available, within reasonable distance of the roof glass. Keep the surface reasonably moist, but do not disturb the seeds when giving the necessary water.

Where a propagating case is available the seed pots may be placed therein, as considerable benefit is afforded the seedlings in the early stages where a case can be used. The warmer and more humid atmosphere, and regular temperature thus afforded conduces to rapid germination the seeds. A cross section of a scaffold pole, or any deal roughly sawn, and soaked for a few days in the rain water tank forms a good seed bed. These pieces of wood should be about an inch thick, and shaped so as to fit into a pot. Fill the pots almost up to the wood with clean broken crocks, over which place a thin layer of finely chopped sphagnum, and place the blocks thereon. Water previously to sowing the seeds, as this will assist in attaching the seeds to the wood. The disadvantages of this method are that very frequent waterings and attention are required

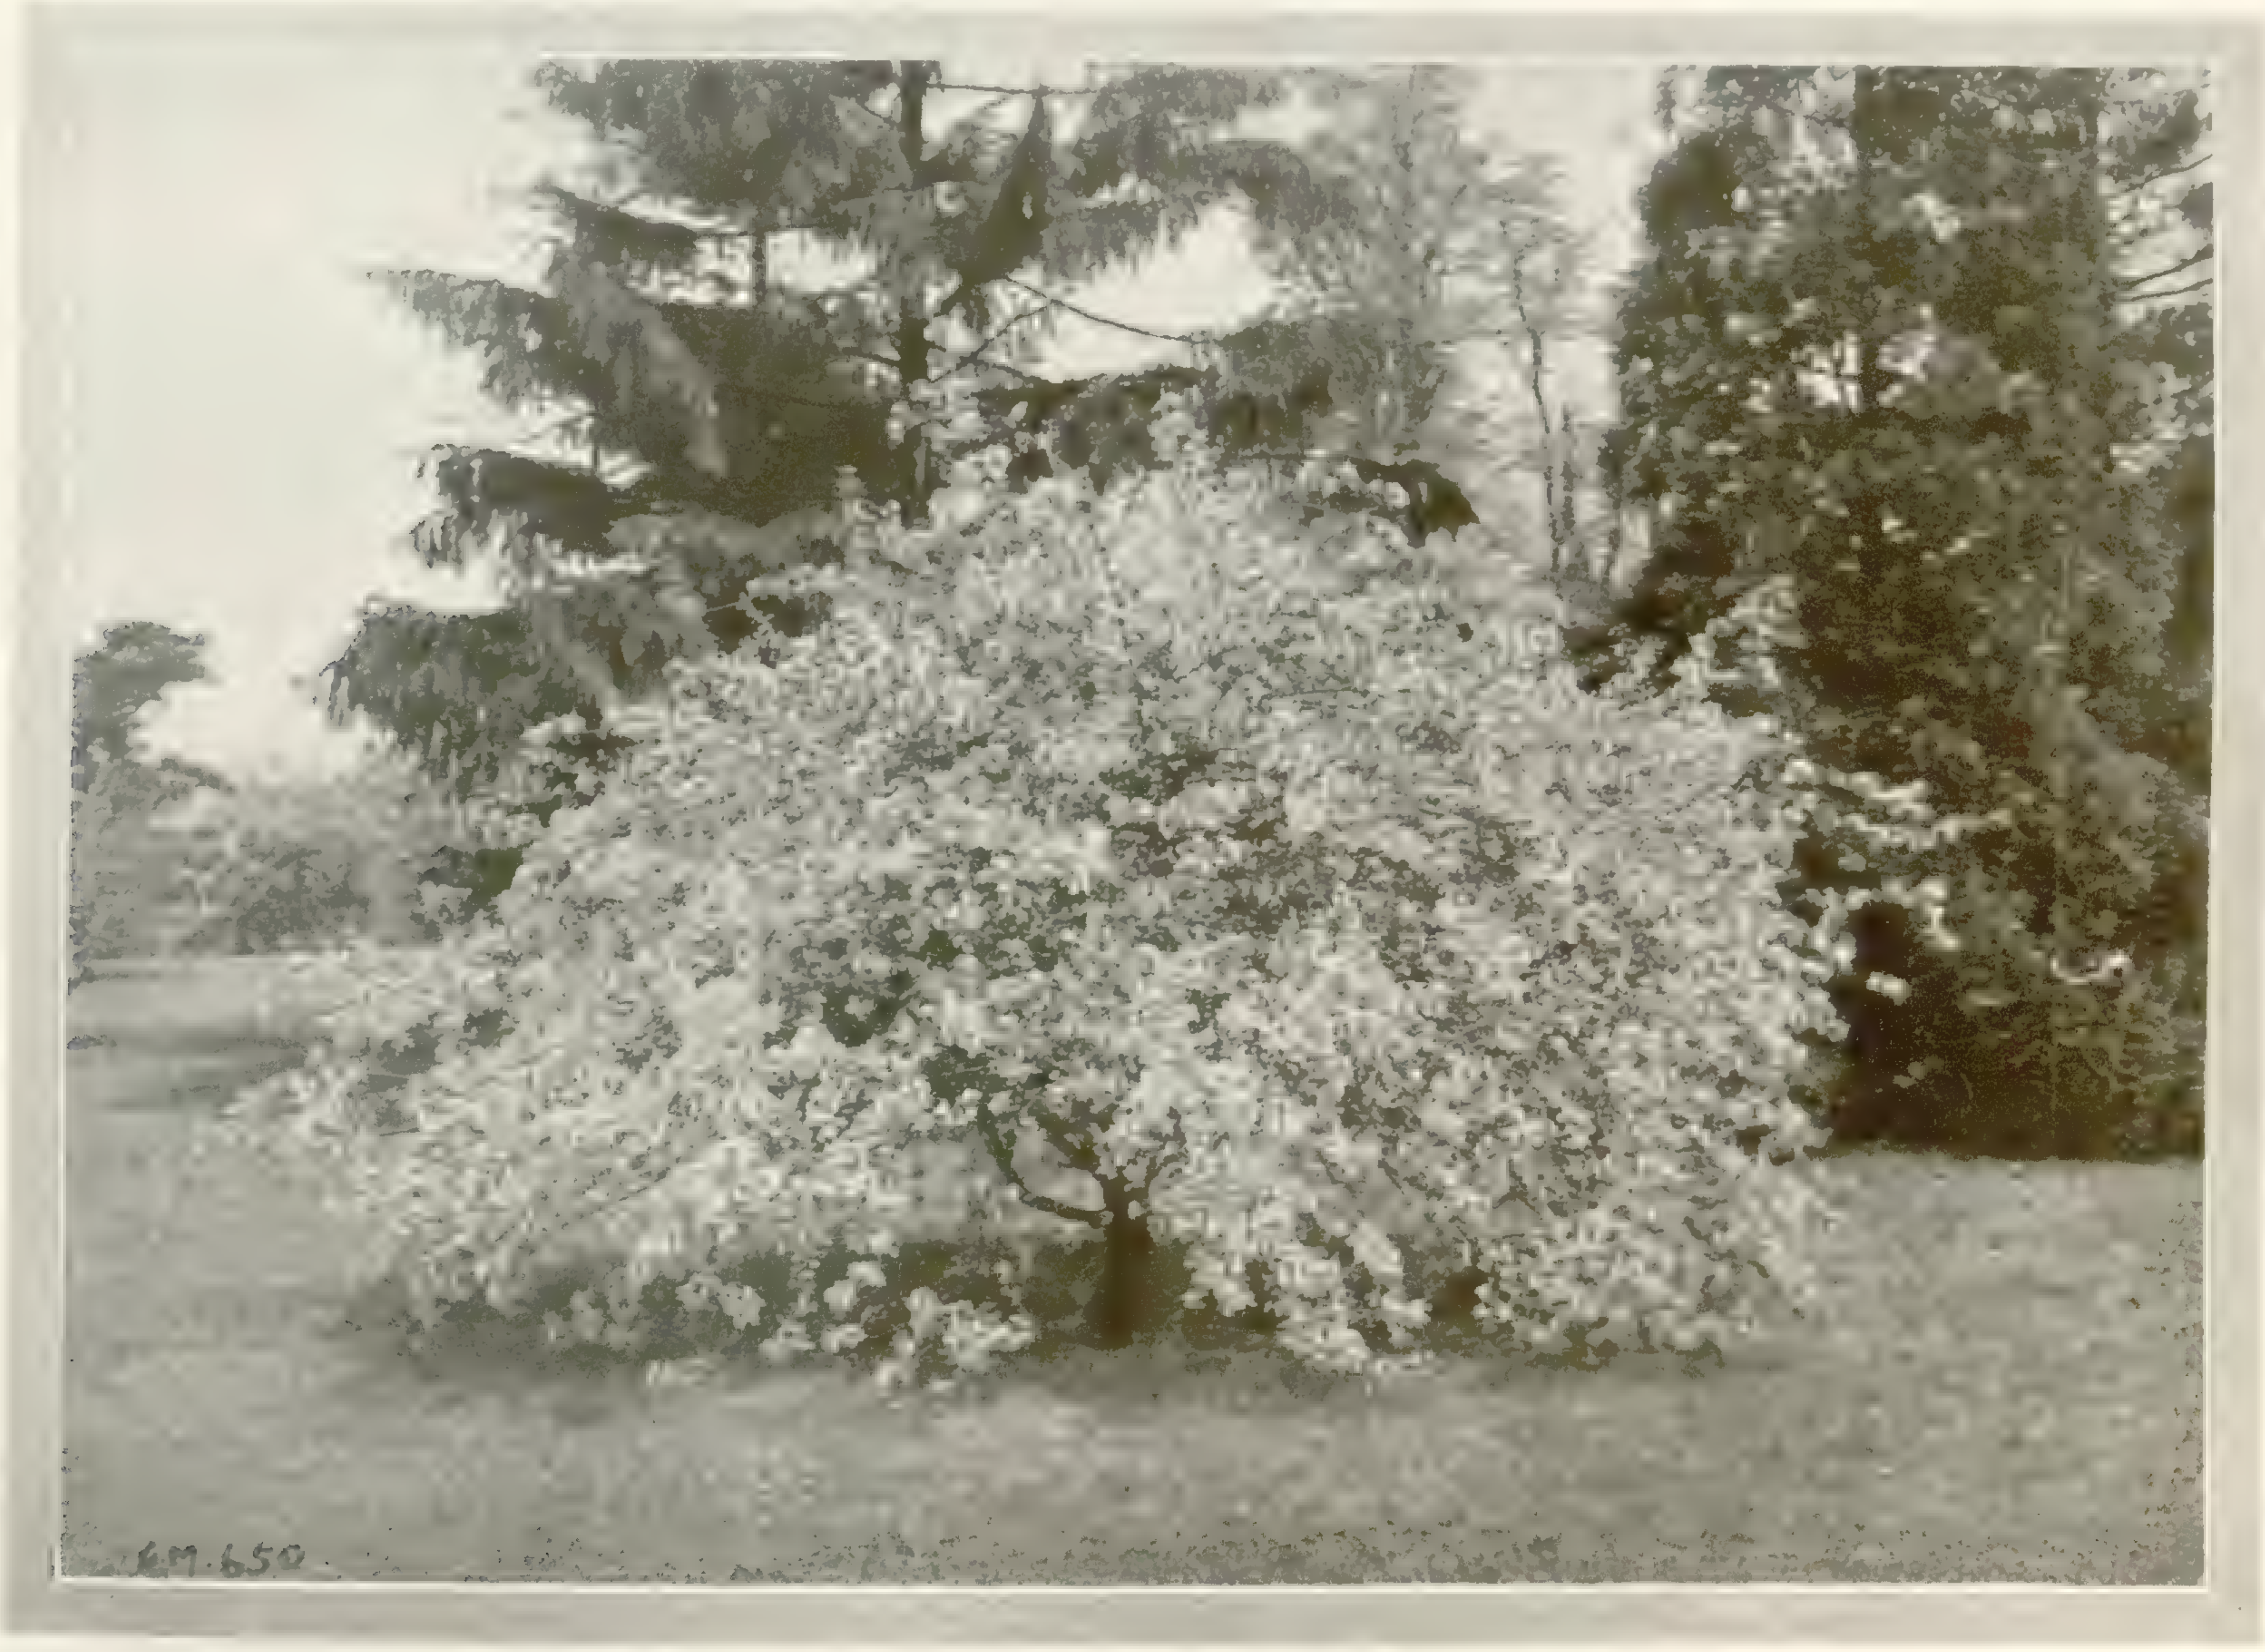
In the case of calanthes, which ripen their seeds in a reasonably short period—about three to four months after fertilisation—there is a difficulty in finding suitable seed beds. I think this seed should be sown immediately it is ripe. If the stock plants have been repotted the seeds may be sown on the surface of the potting compost. Where the plants have not been repotted select those that have started into growth, and make sure that the old compost is thorough wetted through before seeds are sown.

Cypripedium seed is best sown on the surface soil in pots containing cypripediums, but as seedling cypripediums are often found germinating under the stages and in various positions, it may be assumed that it is not altogether essential they should be sown in the position suggested. The raising of odontoglossum seedlings was a considerable mystery for many years, as only an occasional plant was procured from the thousand's of pods of seeds sown. Yet at the present time we find that odontoglossum seeds germinate more readily than those of any other class of orchids. The only reason that I can offer is the inclusion of some broken leaves in the potting compost. The seed is best sown on the surface of the potting compost of plants of their own kinds. I find it best to sow some portion of the seeds as soon as the seed pod bursts. The remainder of the seed may be wrapped in paper and placed in a light position in the odontoglossum house to complete its ripening, and be sown when ready. Select as seed beds surfaces of a lasting nature, as some of the seed may lie dormant for months, while others on the same seed bed will make rapid progress and be fit for pricking off in a few weeks. Seeds of odontoglossums must not be permitted to become unduly dry or they quickly lose their germinating power.

Oakwood Gardens. H. J. Chapman.

DWARF SPECIMEN PYRUS.

We have on several occasions directed prominent attention to the great value of Pyrus malus floribunda for beautifying the pleasure grounds in May, and we have within a quite recent period given two illustrations of standard specimens for the purpose of showing how effective they are when grown in that form. One of these was a finely developed specimen in the gardens of Aldenham House, and the other of the fine avenue which forms so characteristic a feature of the approach to Paddockhurst. We have no wish to overstate the case in favour of these elegant free-blooming trees; but it appears necessary to show how attractive they are when grown as dwarf specimens, and thus assist the reader in making a selection for special positions.



A WELL-GROWN DWARF SPECIMEN OF PYRUS MALUS FLORIBUNDA AT KEW.

The specimen herewith illustrated is one of the several dwarf trees growing on and around the mound near the tropical lily house in the Royal Gardens, Kew. These examples are of special interest, for they include the more noteworthy of the several forms, and show how graceful is the habit and how abundant is the production of flowers where sufficient space is given to allow of unrestricted growth. The tree herewith illustrated is P. malus floribunda, and when it is remembered that the buds are brilliant red, and the flowers delicate pink, it will not be difficult to imagine how attractive is a specimen when, as in this case, it is twelve or more feet in diameter. It may also be useful to mention that in favourable seasons the myriads of flowers are succeeded by a bountiful crop of fruits, which, on the approach of autumn, become attractively coloured.

Prominent among the other forms of P. malus is P. floribunda atrosanguinea, which bears flowers that are quite equal to the type, both in size and freedom of production, and are deep rose-pink. This form is so distinct and attractive that it may be described as one of the most effective of the group. The remarkably free flowering and beautiful form known as Scheideckeri is quite distinct in habit from the other forms of P. malus floribunda, for the growth, instead of drooping, is more or less erect, and it is valuable for the contrast afforded. The flowers are produced in great profusion, and are of a comparatively large size, the colour, blush-pink passing to white. The handsome P. coronaria fl.-pl. deserves a fuller recognition than it has yet received from planters. As in the case of Scheideckeri, the growth is erect, but somewhat stouter. The flowers are rose-red and white, and although not so numerous, they are much larger, and quite double. They are also highly fragrant, the perfume somewhat resembling the odour of violets. Another double-flowered pyrus that possesses much merit is P. spectabilis fl.-pl., a strong, upright growing tree that is very effective in its season of flowering. Not so graceful as the forms of P. malus, the tree makes a handsome specimen, and the flowers retain their beauty for a longer period than do the flowers of the type, and of other forms bearing single blossoms. It should be added that all these make handsome bush trees.

G. G.

HARDY FERNS IN WINTER.

Now that our hardy British ferns, in their multiform varietal types, have obtained such a hold on popular taste, a word or two on their winter requirements may be advisable.

Since all but two species, Adiantum capillus veneris and Asplenium marinum, are perfectly hardy, there is no need to provide protection from frost, and, indeed, they are the better for quite cold or normal treatment, since otherwise their period of rest is apt to be shortened, which means eventual enfeeblement of constitution if persisted in. Our remarks, naturally, apply only to such varieties as occupy cold conservatories, and not at all to those grown in the open, where they are perfectly capable of holding their own in the garden, as they do in the wild state in the glens, woods, and other natural habitats in which they abound.

Under glass the chief risk they run is drought. Some of the species are evergreen, retaining their fronds throughout the winter, and through the spring, until the new ones arise. These run far less risk of being allowed to get thoroughly dry than do the deciduous ones, which shed their fronds so entirely that nothing is seen above the soil beyond mere stumps, or, in the case of some species, not even that, their root-stocks being quite sub-terrestrial.

The result of this is too often an idea that no water at all is needed, as there are no signs of growth, but inasmuch as all pots and pans are, or should be, porous, all the moisture in the soil is sooner or later absorbed by the pots, and evaporated into the air, and a perfectly dry mass of soil, as hard as a brickbat, becomes the envelope of the root system, and, in all probability, the crown of the fern or the travelling root-stock becomes absolutely shrivelled and dead by the absorption of its vital moisture by the thirsty soil. Now, as Nature is always our best guide, we have only to consider under what condition these ferns would exist during the winter in their native habitats to recognise the fact that their roots are practically soaking in moisture the whole time, the soil is never dry, and, as a consequence, the root-stocks and crowns are kept constantly plump and healthy. Furthermore, root action begins long before we notice any obvious growth above ground, and if we pull up even a deciduous fern we shall find a mass of roots with whitish tips, indicating activity even in midwinter.

To preserve the plants then it is indispensable that water be supplied during the winter season sufficient to ensure that the ball of earth is thoroughly moist, and if this has been neglected for any length of time, the pot or pan should be plunged bodily under water for an hour or two to ensure thorough soaking, mere superficial watering simply running out as fast as supplied between the soil and the pot owing to the shrinkage of soil caused by drought. When for any reason the fronds of the evergreen species have turned brown, so much of them can be cut away, but it is not well to remove green and living ones, as they undoubtedly assist the roots in building up the new set of fronds for the following season.

In the open it is not advisable, for tidiness sake, to remove the dead frondage of deciduous ferns unless at the same time a good mulching of dead leaves be placed round the crowns. These dead fronds act as protectors from frost and drying winds, and if removed without a substitute being provided, eventual growth may be checked by the destruction of the young new roots, which in ferns always spring from the bases of the future fronds, and may be noted creeping down the sides of the projecting root-stocks to reach the soil. Once they penetrate this they are safe, and in persistently damp seasons they are probably able to hold their own anyway; nevertheless in March or thereabouts, i.e., precisely at the time when they are most to the fore, it is well to be on the right side, and either leave them their native protection of old fronds or provide the substitute suggested.

CHAS. T. DRUERY, V.M.H., F.L.S.

BEES IN RELATION TO GARDENING.

(Concluded from page 75.)

The devices by means of which flowers force bees to deliver up a portion of their load of pollen are ingenious in the extreme. They have been fully and ably described by Darwin, Müller, and Lord Avebury. In the time available to-day only a few representative flowers can be dealt with; but those illustrated each represent large and important families of plants.

In order that I might demonstrate the effect of the absence or presence of bees on the crop of fruit I carried out a series of experiments this year, and have photographed the results. Gooseberry, red currant, and black currant bushes were enveloped in muslin before the blossoms opened, and were thus protected from the visits of bees. These bushes were then compared with similar bushes in the same rows and grown under exactly the same conditions with the one exception of the muslin envelope. One protected gooseberry bush yielded only six gooseberries, but the two adjoining bushes yielded respectively 151 and 167 berries; they having been visited freely by bees from hives about fifteen yards distant. Two years ago I happened to photograph the same bush that was protected this year in order to show a friend who complained of the failure of his gooseberry crop that I had been more fortunate than he. The number of berries was nineteen when the photograph was taken, but a heavy toll had then been taken by the birds. The six berries on the protected bush were probably due to the presence of a raspberry beetle, which was enclosed in the muslin. These beetles frequently emerge before the blossoms of the raspberry are open, and then feed on the pollen of the apple, strawberry, and gooseberry. The protected red currant bush yielded a few currants, chiefly as single berries. In this case ants crawled up the main stem and may have fertilised some of the flowers, or the wind may have assisted in distributing the pollen. A similar bush in the same row had a heavy crop of currants. It is sometimes stated in the daily press that the depredations of birds are due to the lack of moisture and that the provision of a supply of water will protect the fruit. This year there was not a single day upon which a plentiful supply of water was not available at a distance of a few yards, but the depredations of the birds have been even worse than usual.

The isolation of the black currant bush by means of the muslin was almost complete, for only two berries appeared. In this case it was remarkable that the foliage of the protected bush was less fully developed than that of its neighbours. The adjoining black currant bushes gave an average yield.

The influence of the hive bee in securing the proper fertilisation of fruit trees is so generally known that the apathy of fruit growers in applying this knowledge is somewhat remarkable. Those who do so, however, have every reason to be satisfied with the result. Mr. R. Brown, of Somersham, Hunts, is a well-known fruit grower, who some years ago was dissatisfied with the yield of fruit from his trees, and, on the advice of a friend, procured some hives of bees as a remedy. The result far surpassed his expectations, for, in the ensuing year, his crop of bush fruit increased fourfold. Being desirous of ascertaining whether Mr. Brown's subsequent experience agreed with his first results I communicated with him, and he writes on August 10 as follows:

"I am thoroughly convinced that bees are the chief factors in the fertilisation of fruit blossoms, and the production of fruit both as regards quality as well as quantity. Living as I do right in the midst of a fruit growing district, and being an ardent bee-keeper as well as horticulturist, I have made this subject a special study, and have not the slightest hesitation in affirming that where bees are kept, much better results obtain in the garden and orchard. In 1907 when we had a very cold spring, and when bees could work only at brief intervals and at short distances from home, there was an abundance of fruit in three orchards close to my apiary of fifty stocks. I closely watched their movements, and made a special point of noting the results, and can affirm that, with the exception of these three orchards in the immediate vicinity of the apiary, there was scarcely any fruit at all in this district.

"This year, the weather being favourable at brief intervals for the bees to work, I have got the heaviest crop of apples I have ever had, and up to the present I have gathered 150 bushels off two acres, comprising the varieties Ecklinville, Peasgood's Nonesuch, Beauty of Bath, Julian, June-eating, etc., being only a first picking, and scarcely half the crops. This is a season when apples are quite scarce in our district!"

This favourable testimony of a practical fruit grower might be amplified by the remark that Mr. Brown obtains a large quantity of excellent honey from his hives.

MYRTLES.

The myrtle is a popular favourite with both amateur and professional gardeners. In cool or slightly heated greenhouses and conservatories one may see useful plants growing in pots, but how rarely do we see a fine specimen plant in full flower. The myrtle is, I know, mostly grown for the fragrance of its leaves, but when a good specimen flowers profusely then it has an added feature and attraction for everybody.

In the southern counties the plants will live outside year after year, and attain to a great size. In the northern counties the plants do not, as a rule, live and thrive well in the open air. In the county of Hampshire I had a noble specimen growing against a wall in a very sunny spot, and nearly every year for a long period the plant bore hundreds of blossoms, and presented, not only a novel, but a most charming appearance. It was about five feet high, and about seven feet through. Its position was at the top of a gradually sloping bank, and, as previously stated, close to a high wall. No training was attempted, the habit was natural, bush-shaped. The soil was poor, with much old mortar rubble in it, and as no feeding was done, the growths were annually small to medium in strength, but they matured thoroughly.

GEO. GARNER.

Carrots.—Make a good sowing of the seed of Inimitable on a steady hotbed, keeping the lights closed till germination takes place. Then admit enough air to prevent the seedlings becoming drawn. Sow seeds of radishes on the same bed broadcast in small quantities. Early in February seeds of the Early Gem type can be sown for succession. —GEORGE ELLWOOD.

SEMI-DOUBLE PÆONIES.

If the herbaceous pæonies do not obtain so much attention in this country as in the United States, they enjoy a high degree of popularity, and are being grown in English gardens in largely increased numbers. That they are popular with lovers of hardy plants is not surprising, for they are varied in form and colour, free in flowering, and highly effective when grown under the conditions favourable to their full development. There are the double varieties which bear flowers that at once appeal to the florist who regards plenitude of petals and a regularity of outline of primary importance, and there are the semi-double and single varieties which are much appreciated by those who prefer lightness and care but little for the "properties" of the florist.

HERBACEOUS PÆONY PRINCESS DHULEEP SINGH.
A beautiful semi-double variety, with pink flowers, raised by Messrs. Kelway and Son.

Each section contains large numbers of varieties possessing much beauty, and those who grow pæonies will act wisely in planting varieties for which they have a decided preference. If they do this they will derive more pleasure from their pæony beds and borders than will be the case if they plant most largely those sections for which they care but little, because of their having allowed themselves to be persuaded against their will by some friend who holds very decided opinions. The varieties selected should, of course, be in all cases the best in the section, or rather the best that can be purchased at a certain price.

Attention has been directed to the desirability of cultivators planting the most freely varieties belonging to sections that give them the most pleasure, because in briefly alluding to the section bearing blooms with large clusters of petaloids in the centre, it should not be thought they are recommended as superior to the other groups. It would not be difficult to write eulogistically of their varied charms; but this note is essentially of a practical character. Therefore, it will only be said that the clusters of yellow petaloids produce an exquisitely beautiful effect when seen in contrast with the crimson, rose, pink, or white guard petals.

The following comprise some of the finest varieties belonging to the section. Cendrillon cherry red, with pink and golden centre; Her Grace, white with yellow petaloids; King of England, rich ruby, with gold and crimson centre; Knight of the Thistle, deep crimson, with golden centre; Lady Cecilia Rose, white, with soft yellow centre; Moonlight, white with narrow white petals in the centre; Princess Dhuleep Singh, bright pink, with white centre; one of the best of the many fine varieties that have been added to the section by Messrs. Kelway and Son, and Treasure Cup, salmon-pink, with golden centre.

Those who intend forming new beds and borders of pæonies this season should commence the work of preparation with as little delay as possible. The soil should be trenched to a depth of two feet, and be liberally enriched with farmyard manure, and leaf-mould, or other vegetable matter. The planting may be done at any time between the beginning of February and the middle of March, provided the soil is in a suitable state.

Caladiums. — Though it is rather early to start the main batch of caladiums, it is wise to look over the stock, as here and there some may have started; these must, of course, be brought to the light, as well as a batch of the smaller-leaved varieties, C. argyrites and C. minus erubescens. Shake them from the soil, and place in a box to start, which they will readily do if syringed overhead for a few days.—T. S.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

WINTER - FLOWERING CYPRIPEDIUMS.—The bulk of the early-flowering members of this section should now be examined with a view to repotting. Work of this kind that can be attended to now should not be deferred, for as the season advances the general work increases, and everything that will facilitate matters should not be delayed longer than is absolutely necessary. I have on several previous occasions alluded to the desirability of these plants for cultivation in the neighbourhood of large towns, and by those whose accommodation is restricted. In the former there can be no question as to their utility, and in the latter we find that they flower at the season when very few other plants are procurable, and the lasting qualities of the flowers secure a display over a prolonged period, which is a great consideration.

C. FAIRRIEANUM.—I need not here enumerate those suitable for the purpose, but I cannot pass on without mentioning C. Fairrieanum. I have frequently heard complaints that this species is commencing to deteriorate under cultivation. I cannot say this has been my experience, and this notwithstanding the fact that the plants have been heavily seeded. I consider that, if anything is likely to weaken the constitution and distress recently imported plants it is using them for seed parents. Some of the earliest imported plants on their reintroduction were procured, and, naturally, as soon as the flowers were ready they were fertilised. Each year these plants have increased in size and vigour, and have now made nice specimens which have produced satisfactory flowers. The plants have been accommodated in a lofty house in a temperature that may be termed cool-intermediate, that is, where the normal temperature has been about 55 to 60 degrees at night. They have had a copious supply of moisture both at the roots and in the atmosphere at all seasons. Potting requirements have been attended to each year in the months of January and February. Many of the plants were very small when they were bought, which necessitated their being put into small pots. These small receptacles have necessitated annual attention and repotting, but as soon as the plants have reached five-inch pots and upwards they have not been disturbed. I consider if good lasting material is used these dwarf cypripediums should not be disturbed more frequently than is absolutely necessary. The pots are drained to about one-third their depth, and the potting compost consists of peat, osmunda fibre, a little turfy loam, and chopped sphagnum moss. Some coarse sand and finely broken lime rubble has been intermixed with the potting compost. I consider lime rubble benefits the whole of the winter-flowering kinds. The plants are watered as soon as repotting is completed, and the usual treatment of repotted plants has been given afterwards. I am quite sure they require no coddling, and if they are treated under the same conditions as the ordinary C. insigne no difficulty need be anticipated in their successful culture.

REPOTTING.—The remarks about repotting that I have applied to C. Fairrieanum will apply also to the other sections of cypripediums. The larger specimens should not be disturbed more frequently than is absolutely necessary. The plants should be examined, and all dead and decaying leaves, etc., be removed. When there are several growths that have flowered, with only one lead to the rhizome, it is desirable that the rhizome between the growths immediately behind the last-flowered one should be severed. If this is done, and the plants are left undisturbed or only top-dressed, it will be found that they readily produce young growths, which add to the appearance and size of the plants. The inclusion of loam in the potting compost must be left to the discretion of the grower. I found that cypripediums generally were detrimentally affected in winter where loam was included in the compost, at the time I had charge of a collection nearly in the heart of London. It seemed to retain moisture for a considerable period, and had a tendency to produce spotting and disfigurement in the foliage. See that ample drainage is afforded. —H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

PROPAGATION.—Where quantities of small plants are required for the decoration of the house, as well as to keep the stoves gay during the season, propagation must be continued more or less all the season through, with, perhaps, the exception of from October to the end of January. But once the turn of the days arrives propagation must be begun in real earnest. Unfortunately there are many otherwise well-appointed places where the accommodation for propagating is sadly inadequate, and all sorts of contrivances are used; but where there is a propagating house, or a good frame properly heated in a cucumber or melon house, propagation is generally a very easy matter, providing, of course, the air in the frame is kept in a uniformly moist condition, and, in most cases, the soil should be kept moderately moist also, for should the foliage once flag the chances are that the cutting will die. A few of the more useful plants that should be propagated now are crotons, Acalypha Sanderiana, A. musaica, A. marginata, Panax Victoriæ, dracænas in variety, gardenias, hibiscus, and ixoras. Of crotons, acalyphas, and panax I like to secure moderately strong side shoots for propagation, and prefer to insert them singly in thumb pots in a light compost of loam, peat, leaf-soil, sand, and a little charcoal, and this mixture will do for most stove plants, though for the gardenias and ixoras a much larger proportion of peat should be used.

DRACÆNAS.—These usually make the best plants when propagated from the roots, which may be placed several in a pot, and as soon as the young shoots appear through the soil should be potted off singly into small 60's. D. Sanderiana and D. Godseffiana, do not make thickened roots, and so should be rooted from offsets or points of shoots. D. Goldieana and D. Lindeni require to be cut down, and the resulting young shoots used; the latter makes one of the finest of ornamental foliage plants. Batches of ficus, fittonias, panicum, tradescantia, and Pilea muscosa should be rooted as opportunity affords, as they are always useful for planting round borders or the edges of staging, as well as furnishing the tops of pots or jardinieres in the house.

SEEDS may now be sown of gloxinias, torenias, smilax, Asparagus plumosa, deflexus, and Sprengeri; streptocarpus, etc., etc., the if there is not room in the propagating frame for them then they should be stood close together in some warm part of the stove, and have moss packed between the pots, and be carefully covered with glass. Keep a sharp lookout for slugs, crickets, beetles, ants, etc., as many of the seedlings may be eaten off unless very particular attention is paid to them.

GLOXINIAS.—A good batch may now be started, and if not already shaken out from last season's pots this should be done at once; put the most forward of the tubers an inch or two apart in boxes, just covering them with a very light compost, consisting of leaf-soil, sand, broken charcoal, and a little loam, into which they will readily root, when they may be transferred direct into their flowering pots.—T. STEVENSON, Woburn Place Gardens.

FRUITS UNDER GLASS.

EARLY FIGS IN POTS.—Trees started sufficiently early, with their pots plunged in bottom heat, to have commenced growth should have a temperature of 55 degrees by night and 60 degrees by day, with a corresponding rise from sun heat, after the top ventilators have been slightly opened. Maintain a moist atmosphere by damping the floors, and by syringing the trees in the morning and early afternoon, and by this means also endeavour to avoid attacks of red spider, but should this insect appear sponge the affected leaves with a weak solution of soft soap. As growth develops slightly raise the temperature, and make the most of the sun's warmth by closing the house early on bright days, the bottom heat being kept steady at 65 to 70 degrees. Guard against their becoming crowded by thinning out weakly and otherwise unsatisfactory shoots, and stop the fruit-bearing growths at the third or fourth leaf. The need of watering will increase in comparison with that of the trees' growth, and in like manner will assistance, in the form of diluted liquid manure, or light top dressings of artificial manures, be needful.

EARLY PERMANENT FIGS. — There should now be no delay in closing a permanently planted house that has been prepared for the purpose, to supply successional fruit to that furnished by early forced trees in pots. Until the trees show signs of growth the borders, after having been moistened, should be but sparingly watered, and enough fire heat only be given to slightly warm the pipes. Daily syringe the trees with tepid water, and keep the atmosphere moist by damping the inside surfaces of the house. After leaf growth develops, especially if the trees are well established ones, with their roots, as they should be, confined to well-drained small borders, liberal supplies of water and manurial stimulants will be required. Heavily cropped trees will likewise be greatly benefited by having their borders topdressed with rich compost, and mulched with good farmyard manures.

EARLY VINES IN POTS.—Advantage should be taken of sunny, mild weather in which to carry on the chief work of forcing early pot vines, for growth accelerated by this means is much more satisfactory than that advanced by artificial aid, and for this reason no attempt should be made to uphold under all conditions of weather strictly fixed temperatures; endeavour, however, to maintain the plunging material at 75 to 80 degrees. Disbudding should be begun when necessary by removing the weakest growths, and when completed enough of those that show the best bunches should be left to properly clothe the trellis. Maintain a fairly moist atmosphere, and on bright days syringe the vines in the morning and early afternoon. Give careful attention to watering, and also afford occasional supplies of diluted liquid manure.

EARLY QUEEN PINEAPPLES.—There should now be no delay in starting plants into growth to supply ripe fruit in summer. Unless conditions necessitate its being done it is not advisable to replunge the plants, but, in any case, the plunging material should possess a steady warmth of about 85 degrees. The night temperature of the house should be raised from 65 to 70 degrees, and that from fire heat for the day 5 degrees higher, accompanied by a fairly moist atmosphere. Slightly ventilate the house when the temperature from sun heat reaches 80 degrees; entrap solar heat by early closing, and lightly syringe between the plants. Give the plants enough tepid weak guano water to thoroughly moisten the soil.—T. COOMBER, The Hendre Gardens.

THE KITCHEN GARDEN.

SEAKALE PROPAGATION. — If the thongs are now prepared good forcing crowns may be obtained from them for next season's supply. It is not necessary to grow the crowns on for two seasons if the production of supplies for home consumption is the aim. By taking them in hand now the "sets" will have nice crowns with strong stocky growths when the April planting time arrives. This gives a gain of two months over ordinary root planting. In preparing the "sets" the strongest and quite clean root thongs should be used; discard pieces that show the smallest signs of black rot, and burn them. The sets should be six inches to seven inches in length, with the top cut square, and the base cut diagonally. This method prevents confusion as to which is the growing end. Tie up in bundles of thirty to fifty, according to their size, when prepared, and stand them upright thickly in boxes eight inches in depth, and work finely sifted soil amongst them. Water them well in, and place in a frame or vinery just free from frost.

ARTICHOKES (JERUSALEM). — When the weather is favourable Jerusalem artichokes should be lifted, placing the large tubers under a wall facing north, covering them with sand or ashes till required. If it is intended to grow them on the same plot again the ground should be forthwith trenched, adding some decayed manure as the work proceeds. Plant medium-sized tubers as soon as the work is completed.

RHUBARB.—If it is desired to replant add to the area under this crop no time should be lost. The ground should trenched, and well prepared, so that for a few years an annual top-dressing will suffice. If the land is wet and heavy also apply soil, old mortar, and burnt garden refuse. Champagne is a very early variety, with very high colour and delicious flavour. Sutton is a very large and finely coloured kind, quite distinct, and good. Division the general method in increasing the number of stools.

SPINACH.—To make sure of a constant supply of spinach according to requirements, a bed should be formed of mild fermenting materials in a frame. It is remarkable how large is the quantity that can be gathered from an ordinary garden bed when no growth of the outside crop can make headway during the cold spring days. The beds of autumn-sown spinach should be hoed weekly with the Dutch hoe, and a dusting of soot and wood ashes be given. A protection of spruce or yew boughs helps materially to maintain a sturdy growth.— ELLWOOD, Swanmore Park Gardens.

HONOUR TO MR. HARRY J. VEITCH.

There was probably no prouder man in England on Tuesday evening last than Mr. Harry J. Veitch, V.M.H., F.L.S., head of the firm of Messrs. James Veitch and Sons, Chelsea, who was honoured on that occasion by being entertained at dinner at the Royal Horticultural Hall by a large company of leading horticulturists. The event was an historic one, as the Harry Veitch portrait, painted by Mr. Hugh Riviere, was on view, and also a second portrait of Mr. Veitch by the same artist. The first portrait is to occupy a position of honour in the Council Room of the Royal Horticultural Society, and will serve to remind all who see it of one of our finest business men, a man who has been in the forefront of horticultural matters for nearly half a century, and who has been always one of the most generous supporters of and workers for the gardening charities.

The chief portrait was hung in the Royal Horticultural Hall early on Tuesday morning, so that large numbers of visitors to the meeting were able to see it, and the general concensus of opinion was that the likeness was a splendid one. It depicts Mr. Harry J. Veitch standing by a low table, holding a lens in one hand and a flower of Masdevallia Harryana in the other.

The dinner, held at seven o'clock in the evening, and presided over by Mr. N. N. Sherwood, V.M.H., was for the special purpose of honouring Mr. and Mrs. Harry J. Veitch, and for presenting to Mrs. Veitch the second portrait of her husband, one rather smaller than the first. In this the pose is very natural, for Mr. Veitch is shown with his left hand half-way in the pocket of his jacket, and everyone who knows Mr. Veitch will recognise this little idiosyncrasy.

There were about a hundred and fifty ladies and gentlemen present at the dinner, this, in addition to the chairman and the guests, including Sir Trevor Lawrence, Bart., Sir Albert Rollit, Mr. and Mrs. Bilney, Mr. and Mrs. Morgan Veitch, Mr. and Mrs. Ingram, Messrs. J. C. Allgrove, J. Anderson, C. Archer, W. P. Atkinson, G. Barr, J. Basham, J. W. Bates, T. Briscoe, G. Bunyard, V.M.H., F. J. Chittenden, W. Cobb, E. T. Cook, H. G. Cove, C. H. Curtis, A. Dawkins, C. Dixon, James Douglas, V.M.H., Charles Foster, J. Gurney Fowler, A. J. Gaskell, W. Goldring, G. Gordon, V.M.H., G. Harrow, J. Green, J. Heal, V.M.H., J. W. Howe, James Hudson, V.M.H., J. R. Jackson, J. Hatcher, H. B. May, W. H. Page, George Paul, V.M.H., R. Hooper Pearson, R. Pinches, T. Morris, F. Reader, E. Rochford, J. Rochford, J. Seden, V.M.H., E.M. Segar, Robert Sydenham, H. H. Thomas, W. P. Thompson, G. Tivey, Arthur Turner, J. G. Vert, J. H. Witty, S. T. Wright, the Rev. W. Wilks, etc.

After the loyal toasts had been honoured, the Chairman, who himself was accorded a hearty reception, rose to propose, "Mr. and Mrs. Harry J. Veitch." He first read some letters from notable absentees, including Baron Schroder, all of whom sent good wishes to the guests of the evening. Mr. Sherwood said that January 25, 1910, would always be regarded as a red-letter day by those who were taking part in the proceedings. They had all come to do honour to Mr. and Mrs. H. J. Veitch, who bore a name that was greatly honoured throughout the horticultural world, and that represented a firm which had done more than any other for the advancement of horticulture, and the introduction of plants from other lands. He referred to the coming of the Veitchs from Scotland to Devonshire, and to the removal from Exeter to Chelsea of Mr. James Veitch, Mr. Harry Veitch's father. Mr. Harry Veitch, he said, had taken part in the Chelsea business for no less than fifty-three years, and had during that time endeared himself to all by his knowledge, tact, and ability, and his great generosity. He had never forgotten the claims of the gardening charities, and had ever lent his aid to the progress of the Royal Horticultural Society. It was Mr. Veitch who so greatly assisted Baron Schroder in the scheme for the fine hall in which they were gathered. He was made member of Council in 1887, and in Council and on the committees he had furthered the work of the great society in every possible way. But, after all, said the Chairman, Mr. Harry Veitch's heart was in the Gardeners' Royal Benevolent Institution, to which he had been a subscriber for fifty-two years. He had been treasurer of the charity since 1886, had twice taken the chair with great success at the festival dinners, had given £500 to its funds as a thankoffering for the celebration of his silver wedding in 1892, and £1,000 to found the Victorian Era Fund on the occasion of the Diamond Jubilee of Queen Victoria, and later on founded the Good Samaritan fund—both in connection with the G.R.B.I. In all, Mr. Harry Veitch had given no less than £4,000 to the institution that did so much to help distressed gardeners or their widows. Mr. Sherwood, continuing, pointed out that directly the idea of honouring Mr. Veitch was mooted, the success of the scheme was assured; there had been 309 subscribers to the Portrait Fund, and the response was so liberal that they had been able to have the second portrait painted, which he asked Mrs. Veitch to accept with their united and hearty good wishes, and a hope that she might long be spared to help the original of the portrait. The Chairman then presented the best wishes of his numerous friends to Mr. Harry Veitch, whom he described as "a good, honest, true-hearted Englishman." Long and loud applause followed, and the toast was received with musical honours for both Mr. and Mrs. Veitch, and three cheers for each.

When Mr. Harry J. Veitch rose to respond, he had a most enthusiastic reception. He first thanked Mr. Sherwood for the kind and generous terms in which his health and that of Mrs. Veitch had been proposed, and then reminding those present that "pride goeth before destruction," he said that there was a just and legitimate pride, and he felt that he might be justifiably proud of the great honour accorded them that evening. He did not remember an occasion on which anyone had been given the honour of two portraits, he thought it quite exceptional, and appreciated it accordingly. His wife wished him to express her thankfulness for the great honour done her, and for the fine portrait presented to her. He felt it no small honour to have his portrait hang side by side with those of Sir Joseph Banks, Sir Trevor Lawrence, and Baron Schroder, in the Council Room. Mr. Veitch referred to his earliest recollections at Exeter, and how he remembered his grandfather sowing the seeds sent home by those famous collectors the brothers Lobb; how he raised oranges from pips, and had his first lesson in grafting when the seedlings had to be worked; how his father and old John Dominy showed him how to cross-fertilise flowers, and how he made his earliest experiments in hybridising with fuchsias. He paid a fine tribute to all who had so ably helped him and his brother in the conduct of the Chelsea business, referring especially to Mr. Manning, who was manager for so long. He thought that only Sir Trevor Lawrence could remember the Royal Horticultural Society's shows longer than he could. He remembered going to a great show at Chiswick with his father in 1851, admiring the specimen plants exhibited by Sir Trevor's mother, Mrs. Lawrence, of Ealing, and of meeting such notable men as Sir William Hooker and Dr. Lindley. It was in his father's house that the scheme for the Fruit and Floral Committees of the R.H.S. was laid. He had always had an excellent example of work and charity in his father, and had endeavoured to follow it. He expressed his great love for the Gardeners' Royal Benevolent Institution, and said that as God had given him much of this world's goods, it was incumbent upon him to use these for the benefit of others, and so pass on the blessing. In conclusion, he thanked Mr. Riviere, the artist; Rev. W. Wilks and Mr. H. B. May, the treasurer and secretary of the portrait fund; Mr. Sherwood for his kindly words; and all present and absent friends for the great honour done to himself and his wife.

Mr. J. Gurney Fowler proposed "The Treasurer and Secretary of the Portrait Fund," the Rev. W. Wilks and Mr. H. B. May, and this was heartily received. Mr. H. B. May confessed to having originated the idea for honouring Mr. Harry Veitch by means of a portrait, and expressed the hope that some day the King and State might see fit to honour horticulture by honouring such a man as their guest. The Rev. W. Wilks showed how liberal had been the response to invitations to subscribe to the portrait fund. All the smaller subscriptions, and the first guineas of those who had contributed largely had gone to provide the portrait to be hung in the hall; then the remaining money was devoted to the second portrait presented to Mrs. Veitch; this still leaving a surplus it was decided to present a photogravure of the portrait to each subscriber, and as this did not quite exhaust the sum received, the happy idea of holding the dinner was conceived and carried out.

Sir Trevor Lawrence proposed "The Health of the Chairman," and pointed out the great fitness of Mr. Sherwood for presiding over them that evening. Alluding to Mr. Sherwood's well-known generosity, Sir Trevor said that the chairman had himself provided the musical entertainment, the excellent Jubilee port wine served that evening, and also the cigars and cigarettes, so plentifully supplied. Musical honours and cheers accompanied the toast, and Mr. Sherwood briefly responded. "Auld Lang Syne" concluded the proceedings just before eleven o'clock.

The musical arrangements were in the hands of Mr. Harry Stubbs (who sang finely himself), and included charming violin selections by Miss Maud Horne, songs by Miss Muriel Webb, and humorous recitals by Mr. W. Churcher.

A New Way to Tie.—The following cutting from the weekly "Florists' Review," is deserving of the attention of those who grow chrysanthemums on a large scale: Joseph Volz and Son, the growers at Cincinnati, have been experimenting with the various ways of tying up such crops as the chrysanthemums, considering that all the generally followed methods have consumed a large amount of time, which might be employed to advantage in other directions. As a result of their trials they have hit upon a plan which they say reduces the time required by at least one-third. Their method, say with chrysanthemums, or any similar plants, is to string one wire over each row of plants, putting it high enough so that it will at all times be well up toward the top of the plants. On this wire they hang little hooks of their own invention, putting a hook above each plant. The hook is shaped like the letter S, except that the top loop is bent down so that it just slips over the wire easily, the lower loop being bent up until it is almost closed throughout its length, with a tight squeeze at the extreme end. Then a string or thread of any character is cut in pieces which will reach from the plants to the hook. A loop is tied about the plant, and the free end is then passed over the hook attached to the wire. The lower loop, being so nearly closed, grasps the thread when it is pulled down into the loop, and holds it firmly. As the grower passes along later and finds the plant again needs bringing up to the perpendicular, all he has to do is to slip the string out of the loop, draw it up until he has the plant where he wants it, and then draw the string down into the loop again, where it sticks firmly until lifted once again. Quite a number of growers who have visited the Volz establishment will try this device next season.

EXHIBITIONS AND MEETINGS.

◆

Gardeners' Royal Benevolent Institution.

REPORT OF THE COMMITTEE FOR THE YEAR ENDING DECEMBER 31, 1909.

Held at Simpson's, 101, Strand, under the presidency of Mr. Harry J. Veitch, at 2.45 p.m., the annual general meeting of the above-named excellent gardening charity was attended by about four dozen subscribers, including Messrs. A. W. Sutton, D. Ingamells, G. Wythes, O. Thomas, A. W. Paul, P. C. Veitch, G. Gordon, A. Dean, G. Paul, A. Turner, G. Monro, W. Anderson, W. Alderson, etc., etc.

After the usual formalities of notice convening the meeting and minutes, the report of the committee for the year was read by the secretary, Mr. G. J. Ingram, as follows:

It is a source of gratification to the committee in submitting their report for the past year, together with a statement of accounts, as audited, to be able again to express their thankfulness at the continued progress of their work, its enhanced usefulness, and its invaluable aid to those men and widows alike who have fallen in the battle of life: victims of misfortune through no fault of their own, who in their helplessness and sorrow have turned to the institution for that assistance which, happily, it is in some measure able to afford. For seventy-one years this horticultural institution has pursued its beneficent course, conferring during that time untold benefits upon those who had claim upon its sympathies and help. In the past year over £200 more has been given from the funds than in any previous year.

Since the committee issued their last report 26 annuitants have died, 17 men and 9 widows, and the circumstances of one widow having changed she thereby ceases to derive further benefit from the funds. Of the men, 6 left widows, 3 of whom have been placed on the funds at £16 a year, in accordance with Rule III., 10; two are awaiting further consideration, while the other case has been declined as not being of sufficient urgency to warrant its acceptance. The committee, after much careful consideration, have decided to recommend the election of 20 annuitants from an approved list of 72 candidates, but they hope it may be found possible after the election to recommend an addition to this number—especially as there will be so many unsuccessful applicants awaiting the permanent aid they so eagerly seek, and whose circumstances are of a pathetically sad nature.

It is impossible to exaggerate the incalculable benefits afforded by the two special funds, viz., "The Victorian Era Fund" and "Good Samaritan Fund." The former, it may be mentioned, assists all those unsuccessful candidates who have been subscribers by grants of money whilst awaiting election: and the latter gives assistance to those poor people—whether they have been subscribers or not—who are in temporary difficulty and trouble, thus helping them to tide over their period of distress and need; 82 cases were assisted from these funds during the past year. The committee cannot emphasise too strongly the value and utility of the "Good Samaritan Fund," which enables them to give immediate help in well-authenticated cases requiring aid. As the income only from these special funds can be dealt with, and as, unfortunately, the applicants for assistance are increasingly numerous, the committee earnestly solicit further support to enable them to extend their beneficent work.

The seventieth anniversary festival dinner, held in June last, under the presidency of Lionel de Rothschild, Esq., was a marked success, and the committee gratefully acknowledge their great indebtedness to that gentleman for his kindness in presiding, for his warm advocacy of the objects of the institution, and its claims upon the benevolent public—more especially of that class who love gardening, and flowers, and feel an interest in those people who in their day have ministered to their pleasures and necessities, and for his generous contribution to the funds. Grateful thanks are also tendered to those gentlemen who acted as stewards or collectors, to the members of the horticultural Press for their continued kind and gratuitous support, to those who sent flowers, to the decorators of the tables, and to other friends, too numerous to mention, who in any way so kindly contributed to the success achieved.

The committee again offer their sincere thanks to those noblemen and gentlemen who have been good enough to allow their gardens and grounds to be opened to the public for the benefit of the funds, amongst whom were Earl Beauchamp (Madresfield), Lord Northbourne (Betteshanger), Lady Battersea (Overstrand), Sir Frank Crisp (Henley), Waldorf Astor, Esq. (Cliveden), and E. J. Wythes, Esq. (Epping). The committee also accord to their esteemed colleague, Mr. Edward Sherwood, their sincere thanks for his kindness in arranging a dramatic performance in aid of the funds, which realised the handsome sum of £100; also to the Messrs. George Monro Concert Committee for again devoting a portion of the proceeds of their well-known annual concert for the benefit of the institution.

The committee have again to refer to the kindly generosity of N. N. Sherwood, Esq., V.M.H., who gave £20 each, being a year's annuity, to two unsuccessful and incurably paralysed candidates; to Arthur W. Sutton, Esq., V.M.H., who kindly provided £20 for another unsuccessful candidate, also incurably paralysed; and to George Monro, Esq., who gave a year's allowance of £16 to a poor bed-ridden, blind widow. These kind gifts have been most helpful to these poor afflicted people, who have expressed their deepest gratitude for this timely aid.

The several auxiliaries still progress, and, happily, continue to be a source of much help and interest. The admirable services rendered by the honorary treasurers and secretaries are very gratefully appreciated, viz.:

Bristol and Bath.—President, Col. H. Cary Batten; hon. treasurer, Mr. W. A. Garaway; hon. secretary, Mr. George Harris.

Worcester.—President, Rt. Hon. Earl Beauchamp, K.C.M.G.; hon. treasurer, Mr. John White; hon. secretary, Mr. Percy G. White.

Devon and Exeter.—President, C. R. Collins, Esq.; hon. treasurer, Mr. W. Mackay; hon. secretary, Mr. W. Mackay.

Wolverhampton.—President, C. T. Mander, Esq., J.P.; hon. treasurer, Mr. Bradley; hon. secretary, Mr. Tom B. Dodds.

Berkshire, Reading, and District.—President, Mrs. Rowland Sperling; hon. treasurer, Arthur W. Sutton, Esq., J.P., V.M.H.; hon. secretary, Mr. L. Castle.

Liverpool Auxiliary.—President, The Right Hon. the Earl of Derby; hon. treasurer, Mr. A. J. Crippin; hon. secretary, Mr. R. G. Waterman.

With the deepest regret the committee have again to chronicle the death of many warm supporters, no less than twenty having passed away during the year, amongst them must be mentioned Mr. C. Czarnikow, Mr. Peter Barr, V.M.H., Mr. W. Roupell, and Mr. David Thomson, V.M.H., all subscribers for very many years. The support and interest of these kind friends will ever be gratefully remembered, and as a tribute to their memory it is earnestly hoped their places may be speedily filled.

It is with much pleasure the committee are able to announce that the Hon. Harry Lawson, M.P., has kindly consented to preside at the seventy-first anniversary festival dinner in aid of the funds, to be held at the Hotel Metropole, on Wednesday, June 22 next. They feel sure he will receive liberal support from all friends of the institution in his efforts on its behalf. The names of gentlemen willing to act as stewards will be warmly welcomed.

In conclusion, the committee desire to reiterate that the institution is a national horticultural charity; it knows no creed save that of need in its eligible applicants; its operations extend throughout the United Kingdom; and whilst it is incumbent upon the committee to acknowledge with the deepest gratitude the practical sympathy and support accorded to their work for so long a period, they plead with all force and earnestness, not only for a continuance of that support, but for an increased interest in the work of the institution, and further aid to enable them to afford assistance to many more of those sad cases which so constantly and so pitifully are appealing for help.

Harry J. Veitch,
Treasurer and Chairman of Committee.
George J. Ingram, Secretary.

In accordance with the rules of the Gardeners' Royal Benevolent Institution, we have audited the accounts, and certify that they are correct, and the books well kept. We also have satisfied ourselves that the securities are in the hands of the Bankers.

Bert J. Monro, }
T. Swift, } Auditors.
J. Willard, }

January 17, 1910.

The motion for the adoption and publication of the report and balance-sheet was moved by Mr. Harry J. Veitch, who referred to the large amount of money received and expended, the great value of the Victorian Era and Good Samaritan Funds, these latter, together with the pensions, being the means of distributing about £4,500 annually in relief of helpless gardeners or their widows. The motion was seconded by Mr. W. Alderson, and carried unanimously. Mr. J. Jefferies moved the re-election of Mr. Harry J. Veitch as treasurer, with hearty thanks for his services. Mr. Jefferies and Mr. A. W. Sutton, who seconded the motion, eulogised Mr. Veitch's great assistance to the fund. Carried.

Mr. George Monro moved the re-election of Mr. G. J. Ingram as secretary, and spoke very highly of the splendid service Mr. Ingram has for many years now rendered. This was seconded by Mr. G. Wythes, and heartily endorsed by the meeting. Mr. Alex. Dean moved the re-election of Messrs. N. F. Barnes, P. Blair, P. R. Barr, W. Denning, James Douglas, G. Monro, H. W. W. Nutting, and G. Wythes, and the election of Mr. R. G. Waterman, of Liverpool, in place of Mr. Vallance deceased, on the committee. Mr. Dean showed how so many horticultural interests were represented by these members—market men, seed trade, market growers, florists, and gardeners. Mr. A. Turner seconded, and the motion was carried.

The auditors, Messrs. Swift, J. Willard, and B. J. Monro, were thanked for their services, and re-elected on the motion of Messrs. Denning and Wheeler. To these auditors was also presented a life membership of the institution. Mr. P. C. Veitch moved that Messrs. B. J. Monro, R. White, and Fred Cooper be elected scrutineers of the ballot. Carried.

The meeting was then adjourned for the ballot, and declaration of the poll.

The poll was declared at 5 o'clock, and the following were the twenty candidates who proved successful: Wm. Bush, 3,526 votes; Louisa M. Elphinstone, 3,227; Samuel Gilbey, 3,029; G. F. Barnes, 3,018; H. Sawyer, 2,973; J. S. Ball, 2,932; Emma Barnard, 2,873; William Chapman, 2,786; William Ward, 2,779; H. Newman, 2,717; J. Harding, 2,708; Thomas Chapman, 2,691; R. P. Sutton, 2,599; Dugald Cowan, 2,585; Annie Hawkins, 2,584; H. West, 2,568; H. Webber, 2,492; Edwin Rattue, 2,401; James Brown, 2,390; and W. Rapley, 2,345. As several pensioners had died since the issue of the voting papers the chairman suggested the addition of George Clark, 2,286, and Alice Latimer, 2,268, and then, under Rule X, the committee proposed to add two specially deserving and unsuccessful candidates, and those selected were A. H. Hunking, 1,238, and Eliza Cosnett (89 years of age), 265. It was pointed out that W. J. Williams, 2,261, had just missed election, and was totally incapacitated. The meeting then resolved that the whole of the above twenty-five candidates be elected to the benefits of the institution, and this was carried unanimously.

Mr. Arthur W. Sutton offered to provide for one of the unsuccessful candidates for one year, and the candidate selected to benefit by Mr. Sutton's generosity was H. J. Rosam, who polled 911 votes; Mr. G. Monro also promised his continued support to Mrs. Fanny Bury, who this time secured 1,031 votes.

Votes of thanks to the scrutineers of the ballot and the chairman, proposed by Mr. G. Monro, closed the proceedings.

We may add that there were 44 unsigned voting papers, and this meant the loss of no fewer than 275 votes.

FRIENDLY SUPPER.

At the close of the business proceedings a number of the subscribers to the institution dined (or "supped") together at "Simpson's," under the genial presidency of Mr. N. N. Sherwood, V.M.H.

When proposing the toast of "Continued Prosperity to the Gardeners' Royal Benevolent Institution," Mr. Sherwood briefly reviewed the work done during the 73 years the institution had been in existence. They had been fortunate in receiving about £4,000 in legacies during the year, but more regular subscribers were needed, as well as more help for the Good Samaritan and Victorian Era Funds, which rendered such valuable aid to unsuccessful or waiting candidates. Mr. Harry J. Veitch, in response, pointed out that 25 pensioners elected that day constituted the largest number placed on the funds at one election. He pointed out that 110,993 votes had been recorded, and he promised to provide for one year for one of the unsuccessful candidates.

Mr. George Paul proposed "The Committee," and in an admirable little speech he hoped that an "auxiliary" might be formed in every county, and said he would do his best to get one formed in Hertfordshire. Mr. White, Mr. W. P. Atkinson, and Mr. G. Monro responded. Mr. W. A. Bilney proposed "The Chairman," and this was accepted with musical honours. In his reply Mr. Sherwood said he would gladly give £20 to provide for one unsuccessful candidate for the ensuing year. The Chairman gave "Mr. G. J. Ingram," a toast that was heartily received, and ably responded to by the Secretary.

The musical arrangements for the evening were in the hands of Mr. Schartau, who was assisted by Miss Doris Clayton and Mr. Valentine Hill.

Bristol Gardeners' Association.

The usual fortnightly meeting was held on January 13, at the St. John's Parish Rooms, and presided over by Mr. S. Shaddick. Mr. J. Basham, jun., representative of the Newport Gardeners' Society, gave an interesting and thoughtful paper upon "Pleasures of a Garden." Mr. Basham said he obtained a love for gardening when a child, and if the State started with the school children, and instilled in them a love for gardening and country life, we should not hear so much of the cry, "Back to the land." The lecturer took his audience in imagination to various parts of the country he had visited, and gave some reminiscences of his travels. He said that all alike could share in the pleasures derived from a garden, and the pleasure obtained was genuine, for all the senses could enjoy them. Messrs. Shaddick, Candy, Lee, Gostling, Shelton, Binfield, Extense, Webber, Harford, and Woodward took part in the discussion, and a hearty vote of thanks was accorded to Mr. Basham.

For two pots of primulas Mr. Jennings was first, and Mr. Shelton second; Messrs. Gostling and Woodward each received three points, the former for cypripediums, and the latter for a basket of Winter Beauty tomatoes.

Reading Gardeners' Association.

The annual general meeting of this popular society was held in the Abbey Hall, Reading, when there was a good attendance of members.

The President (Mr. Alderman Parfitt) occupied the chair at the opening of the meeting, but, being compelled to leave early, the vice-president (Mr. Leonard Sutton) presided for the remainder of the evening. The minutes of the last annual meeting were read and confirmed.

The committee's report for 1909 was read by the Hon. Secretary, and adopted. The balance-sheet was brought forward, and showed the association to be flourishing financially. The hon. secretary was instructed to have the report and balance-sheet printed and circulated among the members. The election of officers for 1910 was proceeded with, the result being as follows: Chairman, Mr. T. Judd; vice-chairman, Mr. F. Townsend; librarian, Mr. E. J. Dore; assistant librarian, Mr. F. W. Exler; treasurer, Mr. F. W. Macdonald, F.R.H.S.; auditors, Messrs. W. Badcock and A. Smith; committee, Messrs. F. Alexander, A. F. Bailey, G. Carter, H. G. Cox, D. Dore, F. G. Drew, C. Foster, H. Goodger, R. A. Hatton, T. Hatton, G. Hinton, F. Johnson,

IN THE HIGH COURTS OF JUSTICE

Edinburgh, an Action brought by CHAS. P. KINNELL & CO., Ltd., against A. Ballantine & Sons, Boness, N.B., resulted in a judgment in favour of Plaintiffs, interdicting and prohibiting the Defendants from using the words "HORSE SHOE" as descriptive of, or in connection with boilers NOT BEING OF THE PLAINTIFFS' MANUFACTURE, sold or offered for sale by the Defendants without clearly distinguishing such boilers from the boilers of the Plaintiffs.

WE WARN BUYERS AND THE TRADE THAT PROCEEDINGS WILL AT ONCE BE TAKEN AGAINST ANYONE INFRINGING OUR RIGHT.

NO BOILERS ARE

"HORSE SHOE" BOILERS

UNLESS THEY HAVE THE NAME CHAS. P. KINNELL & CO., LTD., CAST UPON THE FRONT, and buyers will protect themselves and our rights by at once intimating to us if any attempt is made to pass off as a "HORSE SHOE" boiler, any boiler not being of our manufacture.

IMITATION IS THE SINCEREST FORM OF FLATTERY, but unscrupulous traders for a little extra profit may try to pass off another boiler, which has not all OUR IMPROVEMENTS, as being "just as good."

GET A "HORSE SHOE" BOILER AND ENSURE THE BEST RESULTS.

It has táken years of experience to perfect it, and its NAME "HORSE SHOE" is the "Hall Mark" of EXCELLENCE.

Information as to any attempted infringement of our rights will be gratefully received by } CHAS. P. KINNELL & CO., LTD. 'Phone: Hop 372 (2 lines). Wire: "KINNELL, LONDON."

65, 65a, SOUTHWARK STREET, LONDON, S.E.
WORKS—THORNABY-ON-TEES, YORKS.

H. C. Loader, T. Neve, W. G. Pigg, T. J. Powell, G. Stanton, W. J. Townsend, T. Tunbridge, H. Wilson; hon. secretary, Mr. L. Castle.

The following were chosen to act as judges for certificates, 1910: Messrs. T. Judd, F. Townsend, T. Tunbridge, A. F. Bailey, H. Wilson, and F. W. Exler.

The donations proposed for 1910 were: Royal Horticultural Society, £2 2s.; Gardeners' Orphan Fund, £3 3s.; Gardeners' Royal Benevolent Institution, £2 2s.; Reading Horticultural Society, £1 1s.; Royal Berkshire Hospital, £1 1s.; University College, Reading, £3.

Votes of thanks to the retiring chairman (Mr. A. F. Bailey) and vice-chairman (Mr. H. C. Loader) were carried with acclamation, and the meeting terminated with a hearty vote of thanks to the president and vice-president, who had, in turn, acted as chairman for the evening.

East Anglian Horticultural Society.

The members turned up in good numbers at the annual dinner of this society, held at the Criterion Restaurant, Norwich. The chairman was well supported by the leading local horticulturists, and a capital programme of toast and song was gone through. During the evening Mr. T. B. Field, on behalf of the members, asked Mr. J. Powley to accept a marble timepiece and ornaments, also an enlarged framed photograph, from them, as a token of their appreciation of the useful service he had rendered the society during the past eleven years, as its president. Mr. Powley felt compelled to resign at the end of 1909 owing to advancing years and ill-health.

Beckenham Horticultural Society.

On Friday, the 21st inst., Mr. W. P. Bound, of the Redhill Nurseries, gave a lecture on "Winter Pruning of Fruit Trees."

Apples and pears were given priority, and these, in Mr. Bound's opinion, should not be pruned too early, i.e., not till the trees are well at rest. The lecturer's system of pruning would be such that each branch of the tree would represent a cordon. After the formation of the tree, and when sufficient shoots or branches are obtained, the extensions would not be shortened at all; by this method trees would be induced to fruit early, and by so doing would, in most cases, obviate the need of root pruning. Mr. Webster kindly brought down some wood of various fruit trees, and, by the aid of this, the lecturer ably and satisfactorily demonstrated his points. Summer pruning was not greatly favoured, and, if done at all, not till end of July. The manipulation of spurs and of side shoots so as to keep the fruit as near to the main branch as possible was explained.

Gooseberries, the lecturer said, would, in gardens, no doubt be grown mostly trained to trellises as cordons or multi-cordons. He instanced the fine exhibits placed before the Royal Horticultural Society during the summer. The fruit would be finer, cleaner, more easily protected, both buds and fruit. As usual, birds claimed some attention. The lecturer would prune gooseberries early, and spray over them some deterrent before birds got a taste of the buds. A method apparently new to the members was to collect the prunings, tie loosely in bunches, and place over the trees. According to Mr. Bound's informant, the birds will be attracted to the bunches of prunings, and away from the trees. He mentioned a fine wall of plum trees at Nutfield Priory "worth going a long way to see" (for, like Thomas of old, he had to see to believe): these are grown with the annual shoots laid in exactly like peaches, and crop remarkably.

Very hearty thanks was accorded Mr. Bound for his practical lecture.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

SPRAYING MACHINES. — ADDRESS WANTED.—A correspondent asks for the name and address of any firm or firms in the United Kingdom who sell the hand-spraying pumps made by Meyers, of Ohio, and used so largely in America and Australasia. Perhaps some reader or firm will oblige.

MANURIAL VALUE of PINE NEEDLES.—In answer to the question recently asked in our pages by "H.," as to the value of pine needles in the enrichment of the soil, Mr. A. Gardner, Schloss Strelzhof, Willendorf, writes as follows: — "Apparently not only were the members of the Bristol Gardeners' Association surprised when Mr. Gostling informed them that pine needles had a distinct value as a manure or fertiliser for potatoes, but "H." seems to have been both surprised and rather grieved that Mr. Gostling should have made such a statement. Mr. Gostling might have stated (perhaps he did) that pine needles in their natural and dry state are worthless as manure. "H." will I expect be interested to learn that in some parts of Germany pine needle mould is used as a substitute for leaf-soil. Here, in lower Austria, not many hours from Vienna, we have pine needle manure in abundance. The needles are raked up in the forests in the autumn and used as litter in the cow sheds, for every kind of straw is used up as forage. This sort of pine needle manure I have used in quantity, and find that practically all kitchen garden crops do exceedingly well on it. It is valuable because of its slow decomposition. The peasants hereabouts are able to keep many acres of arable land in a fertile state with perhaps a couple of cows, a few pigs, and an unlimited supply of pine needles. "H." remarks that whatever the fertilising properties contained in fir needles are, "they do not appear to act beneficially on the turf, hence the anxiety to get them swept up as fast as they fall." Pine needles on turf are just about as good or bad as the leaves of deciduous trees would be if allowed to remain. It is only when in a decayed or half-decayed state that either pine needles or tree leaves are of any real use as manure. [We are much obliged to Mr. Gardner for his note.—Ed. "G. M."]

ODONTOGLOSSUMS.—W. T., Lampeter: If the plants have sufficient room for the development of the new growths they are making then do not disturb them. But if more room seems desirable then potting may be proceeded with at once, so that the plants become re-established before bright and hot weather arrives. An accomplished orchid grower will pot a plant at practically any season of the year if he believes such an operation necessary, but the chief potting season for the cool odontoglossums of the O. crispum class is at the end of August and during September, while March and April are suitable months, and are preferred by some to the autumn season. Use fibrous peat and sphagnum moss as potting material, over a considerable quantity of crocks, the latter rather more than half filling the pot. Instead of the crocks, one good crock may be placed over the drainage hole, and the pot be then filled two-thirds of its depth with chopped bracken rhizomes previously killed by subjection to considerable heat—in an oven or in boiling water. Shake the fine material out of the peat, pot firmly, and so arrange the work that the base of each plant is a little higher than the rim of the pot. Newly potted plants need a little shade in bright weather, careful watering, and a moist atmosphere. Your pit seems to be a suitable place for the plants, but we expect it will not be an easy matter to keep it cool enough during summer. Write us again, reporting progress, in a couple of months' time.

CASSINIA FULVIDA.—A. G. R., Wheatley: We feel sure the plant you refer to is Cassinia fulvida, better known in gardens as Diplopappus chrysophyllus. It is a New Zealand plant belonging to the natural order Compositæ. It is a very interesting shrub, and the yellow stems of the young growths give it a distinct and striking appearance. It does well in most places south of the Thames and farther north, in sheltered places, it also thrives. Being evergreen and hardy, it is worth some shelter from biting winds. A mixture of loam and peat appears to suit it well, but the character of the soil does not seem so essential as good drainage.

SHOW AND REGAL PELARGONIUMS.—S. J. A., Worcester.—Of course it was a great mistake to have allowed the plants to grow away without being pruned back hard after they had been rested awhile. You should cut a few of the plants back at once, and encourage them to break into growth from the base; this they will do rather slowly now, but they will make useful examples for late flowering. In the case of the others, provided you are not specially concerned as to the shape of the specimens, you had better at once pot them, and then tie the stems out in such a way as to depress the naked portions, and at the same time bring the growing ends up towards the light. Pinch out the growing points, as this will also help to induce new growth from the old stems. By this means you will obtain free-flowering plants, but they will not be so fine as they would had they been duly cut back.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

F. F., Tring.—1, Galax aphylla; 2, Gaultheria procumbens.

J. B., Horsham.—1, Asparagus verticillata; 2, Semele androgyna.

M. E. J., Mitcham.—1, Pernettya mucronata; 2, Abies nobilis; 3, Strelitzia regina.

G. C. B., Minehead.—1, Quercus Ilex fastigiata; 2, Eranthis hyemalis; 3, Juniperus communis; 4, Tamarix gallica.

S. T., Stafford. — 1, Trachelospermum (Rhyncospermum) jasminoides; 2, Begonia fuchsioides; 3, Gesnera splendens; 4, Acacia dealbata; 5, Odontoglossum Wilckeanum; 6, Stenandrium Lindeni.

OBITUARY.

◆

MR. JAMES BARNSHAW.

Many who knew Mr. James Barnshaw when he was with Mr. Wm. Bull, of Chelsea, will regret to hear that he died on Sunday last at Croydon, where he had a seed and florists' business. Both Mr. Barnshaw and his wife lost their lives in a fire, which appears to have broken out very early on Sunday morning.

FORTHCOMING ENGAGEMENTS.

SATURDAY, January 29.—Annual Dinner of the French Horticultural Society of London, at the Café Royal, at 6.30 p.m.
WEDNESDAY, February 2.—Royal Society of Arts.
THURSDAY, February 3.—Linnæan Society Meeting.
SATURDAY, February 5.—French Horticultural Society of London.
TUESDAY, February 8.—Royal Horticultural Society; Committees meet at 12 o'clock; Annual Meeting at 3 o'clock; Scientific Committee at 4 o'clock.
FRIDAY, February 11.—Royal Gardeners' Orphan Fund, Annual Meeting and Election at Simpson's, 101, Strand, at 3 o'clock.

WOOD GARDEN HUTS

for use as Tool-sheds, Workshops, Potting Sheds, Play-rooms, Cycle Houses, Motor-car Houses, etc., etc. Strongly built of selected materials by skilled workmen. Made in sections for easy erection and removal by local workmen. Painted and finished throughout in a superior manner.

CATALOGUES RECEIVED.

W. ATLEE BURPEE AND CO., PHILADELPHIA, U.S.A.—A most interesting catalogue from one of the largest of American seed houses; it is crammed full of descriptions, illustrations, and horticultural information and is well worth a study. Sweet Peas are a great feature.

J. JEFFERIES, CIRENCESTER.—A catalogue of useful flowers and vegetables, well illustrated and printed, containing a rigid selection of novelties.

J. K. KING AND SONS, COGGESHALL.—Under the title of a "Manual of Gardening" this firm issues its comprehensive catalogue of seeds. Many new things are offered, including new tomatoes, cabbage, cucumbers, Brussels sprouts, lettuce, and potatoes.

GEO. BUNYARD AND CO., MAIDSTONE.—Among the specialities offered in seeds by the Maidstone firm are Kentish Invicta runner bean, and a special strain of long-spurred aquilegias, both of which are represented by coloured plates.

R. H. BATH, LIM., WISBECH.—A useful catalogue of flower and vegetable seeds which can be easily slipped into one's inside pocket.

HENRY ECKFORD, WEM, SALOP.—Quite naturally we expect Sweet Peas to figure largely in a catalogue from Wem, and are not disappointed. Several new varieties are described and illustrated. Good selections of other flowers, as well as vegetable seeds are included.

JAS. CARTER AND CO., HIGH HOLBORN.—This catalogue is well arranged, and contains coloured plates of some of the Holborn specialities, and lists of vegetables and flowers in great variety. The title is "Garden and Lawns."

JAMES SENDALL and CO., Cambridge; Conservatories, Vineries, Garden Frames; Heating Engineers. Surveys made, and Plans prepared to suit any position. Illustrated List free.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

The KING'S SEEDSMEN, **READING.**

VOL. LIII.—No. 2,936. SATURDAY, FEBRUARY 5, 1910.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Seed Sowing.

The season in which the greater proportion of the seeds of useful garden crops and of ornamental plants is sown is of much interest to the general body of cultivators. It is interesting because of the remarkable diversity in the size, form and colour of the seeds of the various subjects required for the proper furnishing of the garden, and because also of the time and thought that have to be devoted to them to ensure their being sown under the conditions most favourable to their germination. If the purchase and the sowing of seeds are associated with much that is of interest in ordinary seasons when the seeds are so well ripened that there is no cause for anxiety with regard to their passing through the process of germination satisfactorily, it must be doubly so in the season on which we have just entered. Many years have elapsed since the difficulties were so great in the growth and the harvesting of seeds that are grown in the open, as those which had to be contended with last year. The long continued cold, wet weather experienced after midsummer was more favourable to leaf development than to flower and seed production, and the persistent rains subsequent to the break in the weather about the middle of August rendered the harvesting of the seeds extremely difficult, and materially increased the cost thereof. To those who are fully conversant with the conditions under which the finest samples of both flower and vegetable seeds are obtained, and take careful note of the weather, it can hardly be otherwise than surprising that the seed trade achieved so high a degree of success in the mitigation of the effects of untoward climatic conditions. We have had an opportunity of handling samples of many of the leading kinds of seeds, and we have found them of much higher quality than at one time we regarded as possible. This being the case cultivators have no cause to be unduly anxious with regard to the results they will obtain from their sowings of seeds of vegetables and ornamental plants. If there be no necessity for much additional anxiety in committing the seeds to the earth, there is occasion for exercising greater care in the carrying out the several details; and it may be for modifying in some cases the practice usually adopted. The seeds are much better than might have been expected, but they are not, as a whole, equal to the high quality that has been obtained for many years past. In some cases, and especially on cold, wet soils, it may be advisable to sow rather more thickly than usual, and to thin out sufficiently to reduce the plants to the proper number for a given area, when it is seen that they are growing freely. But we would suggest that more care be bestowed upon the preparation of the seed bed, which for the present purpose may be a single row or an area on which the seed is sown broadcast. As so generally known the conditions essential to the germination of seeds are warmth, moisture, and the free oxygen of the air, and these conditions are more necessary of fulfilment in a season when the seeds are indifferently ripened, and the food stored up within them for the support of the young plants during their earliest periods of growth is less than when they are perfect in development. There will not anywhere be a deficiency of water in the soil; but the percentage of moisture may be such as to prevent its becoming warmed as the sun's rays increase in power, and also to interfere with the full passage of the air through it, and thereby prevent the requisite amount of oxygen reaching the seeds and assisting in their germination. It will therefore be advisable to well work the surface layer with a view to making it comparatively fine to a depth somewhat greater than that at which the sowing will be made. Both warm rains and air will pass more readily through finely pulverised soil than through that which is so lumpy near the surface that it is difficult to sow all the seeds at the same depth. This latter is a point of some importance in seed sowing, and as a proof of this we would mention that many failures have come under our notice, both in garden and field, which have been caused by some of the seeds being buried at a greater depth than others. Thorough pulverisation of the surface is especially necessary in the case of clay soils, for under ordinary circumstances seed sown in the latter are several days longer in germinating than in friable loams, and with seeds below the average in strength a considerable proportion may perish if buried below the customary depth. A good tilth is advisable for another reason. The seeds, as already mentioned are not so well stored with nutrient matter as usual, and there is a risk that if the plants are not able to push their roots freely among small particles of soil to which their root hairs can readily adhere, they will not obtain sufficient food to make a healthy growth. Seed beds on heavy soils may, of course, be greatly improved by the addition of a liberal proportion of fine soil from the potting shed or frame ground, but as this is a matter of common knowledge we need not do more than briefly remind our readers of the fact.

MR. G. CARPENTER.

Mr. George Carpenter, who has occupied the position of head gardener at West Hall, Byfleet, during the past fourteen years, has, by the exercise of his remarkable administrative ability and cultural skill, obtained a foremost position among those engaged in practical horticulture, and he has achieved considerable success in plant improvement. Mr. Carpenter commenced his horticultural career at Dangstein, Sussex, the residence of Lady Dorothy Nevill, and from thence he went to Petworth Park, Lord Leconfield's Sussex seat. These establishments were under the charge of Mr. Vair and Mr. Breeze, two of the leading gardeners of their day, and much of his success in after life he attributes to their influence. After occupying various positions in private gardens and nurseries of note, Mr. Carpenter received an appointment as head gardener to C. J. Abbott, Esq., Rydens, Walton-on-Thames, and he had not long been in charge before he gave evidence of his skill as a cultivator of chrysanthemums. The first contest in which he took part was on November 13, 1884, and he obtained the premier award with a collection in which the once-popular Boule d'Or, Madame Clemence Audiguier, Elaine, and Meg Merrilees were represented. On the death of Mr. Abbott, Mr. Carpenter was appointed head gardener at Broad Oaks, Byfleet, the residence of Major Collis Browne, and during the eight years he was there he achieved much success as an exhibitor of chrysanthemums and other subjects, once being first in the competition for the Kingston Cup. During the fourteen years Mr. Carpenter has been head gardener to F. C. Stoop, Esq., who takes a keen interest in his extensive gardens, and is one of the most generous of employers, he has done but little exhibiting, and has devoted attention to plant improvement. He has been successful in raising a goodly number of Japanese chrysanthemums possessing much merit, and the best set in any one year was, Mr. Carpenter considers, that obtained in 1909. Some attention has been given to the raising of roses, but as yet the only variety that has been distributed is Kathleen, a charming variety introduced by Messrs. William Paul and Son. The work of Gardeners' Mutual Improvement Associations is regarded with much favour by Mr. Carpenter, and many are the papers that he has read before the various organisations in Surrey. In addition, he was for six years the hon. secretary of the local association.

Conference on Dahlias. Mr. E. F. Hawes, the hon. secretary, writes, I desire to inform you that the National Dahlia Society, has arranged to hold a conference on dahlias at Carr's Restaurant, 264, Strand, on Friday, March 4, at 6 p.m. The following papers will be read, and discussion invited. "Dahlias for Garden Decoration," by Mr. George Gordon, V.M.H. "Growing Dahlias for Exhibition," by Mr. J. Stredwick; and "Methods of Exhibiting Dahlias," by Mr. J. B. Riding. All members and their friends are invited to attend.

Accident while Gathering Wild Flowers.—A case of some importance to those who are interested in Nature Study, and devote attention to the collection of botanical specimens, came before the Court of King's Bench a few days since. The case arose through the death of a gentleman engaged in business at Dover, who was interested in collecting wild flowers. On the morning of the accident he had stated that he intended looking for wild orchids on the cliffs, and he was seen a few yards from the edge of a cliff, stooping, as if examining or gathering wild flowers growing thereon. Some time afterwards he was found at the foot of the cliff, he having fallen over and been killed. His widow claimed for £500 under an accident insurance policy effected by her husband with one of the accident insurance companies. The claim was not accepted by the company, who relied upon the words in the policy exempting them from liability where the accident happened "by the wilful or negligent exposure of the assured to unnecessary danger or peril." The case went to arbitration, and the arbitrator drew the inference that the accident occurred by the assured going too near the edge of the cliff, and that in going very near to the edge of such cliff he was running a risk that no ordinary prudent man would run. The arbitrator consequently awarded that the widow was not entitled to recover. A case was stated for the opinion of the Court, and Mr. Justice Bray gave judgment in favour of the award of the arbitrator, with the result that the claim failed.

The Masters' Lectures.—It will be remembered that a fund was raised to perpetuate the memory of the late Dr. M. T. Masters, F.R.S., by means of lectures directing attention to discoveries of scientific interest, but having a distinct bearing upon practical horticulture. It was also hoped by these lectures to carry on, in some degree, Dr. Masters' work of science in relation to gardening. Two lectures were given in 1909 by Professor Hugo de Vries, of Amsterdam. Two will be given in 1910 by Mr. A. D. Hall, M.A., F.R.S., at the Royal Horticultural Hall, on February 22 and March 22 respectively, and the subject will be "The Adaptation of the Plant to the Soil."

R.H.S. Provincial Show.—We are informed that negotiations are in progress with a view to the Royal Horticultural Society, co-operating in the promotion of a great horticultural show at Liverpool, in connection with the Royal Agricultural Society show. The dates of the exhibition will be June 22, 23, and 24, and full particulars will be issued in the course of the present month.

Southampton Horticultural Society.—This society accomplished much useful work during the past year, and the report that will be submitted to the members at the annual meeting to be held at the municipal offices at 4 p.m. on the 28th inst., is, on the whole, very satisfactory. The society slightly improved its credit balance during the year, but £16 1s. 1d. appears a very small balance for a society whose annual expenditure amounts to £740 14s. The society's arrangements for the current year are: Rose Show, July 5 and 6; Carnation Show, July 27; and Chrysanthemum and Fruit Show, November 8 and 9.

A Beautiful Display of Winter Flowers.—Mr. A. Alderman sends us from the gardens of Wigganthorpe, York, the seat of the Hon. H. W. Fitzwilliam, a photograph taken at the end of November in one of the greenhouses in these admirably managed gardens. The photograph is of much interest as evidence of the success that is achieved in the cultivation of the plants that are specially adapted for winter decorations, and we regret that it is not suitable for reproduction. The plants, it should be stated, are grown for the embellishment of the mansion, and are drafted from the greenhouse as required. On the front stages at the time the photograph was taken were finely flowered examples of Begonia Gloire de Lorraine, and its white variety known as Turnford Hall, and with these were interspersed dracænas, ferns, and other useful subjects with ornamental leafage. On the central stage decorative plants of larger growth were arranged, and, as these included both fine foliage and flowering plants, they evidently contributed liberally to the general effect. These, it may be mentioned, included asparagus, aspidistra, chrysanthemums, cyperus, ferns, palms, and salvias, which, as Mr. Alderman so well states, are extremely useful for producing a display at once cheerful and tasteful at the dull season of the year.

Royal Gardeners' Orphan Fund.—The annual general meeting of the subscribers to this charity will be held at "Simpson's," Strand, London, on Friday, the 11th inst., when the usual business will be transacted and 15 children will be elected to the benefits of the fund. There are 19 candidates. The chair will be taken at 3 p.m., and the poll will close at 4.30 p.m.

French Gardening Exhibition.—With the object of giving greater publicity to the advantages of intensive cultivation, an exhibition of "French gardening" is to be held at the Royal Botanic Society's Gardens, at Regent's Park. Active preparations are now in progress for exhibiting and demonstrating every aspect of the close and scientific cultivation of the soil. The exhibition will take place in July, though the exact date is not yet definitely settled. It is intended the exhibition should be practical in character. Actual "French" gardens will be shown in operation, and the ways in which the soil is fertilised and impoverishment prevented under this system, will also be the subject of demonstration. As well as actual gardens in working order, with the gardeners at work, there will be frequent lectures on the theory and practice of intensive culture, and there will be exhibits of the straw mats, forcing frames, and cloches. It is hoped that many of the proprietors of "French" gardens already established in England will be numbered among the exhibitors. As a practical inducement for them to do their best, a number of prizes will be offered.

National Chrysanthemum Society.—The annual meeting of this society will be held at Carr's Restaurant, 264, Strand, W.C., on Monday, February 7, at 6.30 p.m., when Sir Albert Rollit, LL.D., the president, will preside. The annual report and balance-sheet have been circulated among the members, and from it we are glad to find that the Society has no liabilities, its balance to the good is £79 8s. 11d., and its total assets are valued at £104 1s. 8d.

Messrs. Watkins and Simpson, the wholesale seedsmen of Tavistock Street, Covent Garden, have now formed their business into a private company. The business was founded in 1876 by Mr. Alfred Watkins, who took into partnership his friend, the late Mr. James Simpson. Mr. Watkins has always been the leading spirit in the enterprise, and under the new arrangement he is the governing director, while Mr. J. M. Bridgeford is general manager. A little booklet received from the firm contains portraits of Mr. Watkins and the heads of the various departments of the business, as well as views of the offices in Tavistock Street, the warehouses in Long Acre and Exeter Street, and of flower and vegetable seed trials conducted at the trial grounds at Feltham and Twickenham. It is on account of the business having now grown to considerable size, and for its more convenient working in association with his staff, all of whom have been with him for many years, that

Mr. Alfred Watkins has converted the firm into a private company. There has been no public issue, and no outside capital has been brought into the business.

Scottish Horticultural Association.—At the annual meeting of this society, in Edinburgh, the question of its amalgamation with the Royal Caledonian Horticultural Society was discussed, and the matter was remitted to the council to negotiate, and report. The annual report stated that during the past year there had been an increase of 38 in the membership of the association, but the financial statement was less satisfactory, as this shows a loss of £165 on the year's work, of which £141 was due to the loss on the chrysanthemum show. Mr. J. Whytock was elected president, and Mr. A. D. Richardson secretary and treasurer.

Sweet Pea Annual and Schedule.—A little later than usual, but none the less welcome, come these publications from the National Sweet Pea Society. The thousand members will have nothing to complain of in this year's "Annual," as it is full of interesting matter, and the interest is varied. The issue is several pages larger than those that have gone before, and it is admirably bound in the red cover that is now becoming quite familiar. The story of the Bozeman Sweet Pea Carnival, as told by Mr. S. B. Dicks, is startling, and the illustrations leave no doubt as to the enthusiasm of the inhabitants of Bozeman town in the Far West. Floral Committee proceedings, the story of "The Outing," several practical articles dealing with culture and diseases, a complete catalogue of sweet pea names, a list of members and affiliated societies, Notes on the Reading Trials, and a full report of the proceedings at the Sweet Pea Conference held in December last, are among the more important items, but we hope to refer to the publication again. The schedule shows that the society, assisted by its friends and supporters, is offering liberal prizes at its two-day show on July 12 and 13th next.

The Sherwood Cup.—N. N. Sherwood, Esq., V.M.H., has intimated to the council of the Royal Horticultural Society, that the cup he gives annually to the society shall in future be of the value of twenty, instead of ten, guineas, and the council will add a smaller cup as a second prize if the exhibits are sufficiently meritorious. It is this year offered to amateurs for a group of orchids at the Temple Show—quality being preferred to quantity. The award of the cups will be subject to the decision of judges appointed by the council, whose decision shall be final, and at whose discretion they may be withheld.

R.H.S. Officers.—The following list of president, vice-presidents, members of council, and officers for election has been circulated, in accordance with Bye-law 71: President, Sir Trevor Lawrence, Bart., K.C.V.O., V.M.H.; treasurer, Mr. J. Gurney Fowler, J.P.; secretary, The Rev. W. Wilks, M.A.; members of council, The Rt. Hon. Lord Balfour of Burleigh, K.T., Sir Albert K. Rollit, LL.D., Litt.D., D.C.L., Mr. James Hudson, V.M.H., vice-presidents, The Rt. Hon. Joseph Chamberlain, The Rt. Hon. the Earl of Ducie, The Rt. Hon. Lord Rothschild, Leopold de Rothschild, Esq., C.V.O., Baron Sir Henry Schröder, Bart., V.M.H., Sir John T. Dillwyn-Llewelyn, Bart., V.M.H.; auditor, Mr. Alfred C. Harper. As the number of names proposed does not exceed the vacancies to be filled, there will be no need for a ballot at the annual meeting on Tuesday.

ROYAL HORTICULTURAL SOCIETY.

The following is an abstract of the report that will be submitted by the council to the Fellows at the annual meeting of the Royal Horticultural Society on Tuesday next. The chair will, as usual, be taken at three p.m.:

The past year, though climatically unfavourable for horticulture, has, nevertheless, been a satisfactory one of progress in almost every branch of the society's work.

Wisley Gardens.

The very heavy rainfall and continual damp, coupled with lack of sunshine, has had the same effect on the society's gardens as on most other gardens in the South-East of England. The unfortunate effects have been felt especially in the trials, for which normal conditions are so particularly desirable for obtaining reliable results and records. Steady work has, however, been maintained, and many improvements effected. A new fruit wall, some 100ft. long, has been added, enabling the students to obtain instruction in the training of fruit trees on walls. A complete and commodious potting and working shed has also been built. The public path crossing the lower meadow has been fenced, in order to protect the newly-planted trees and shrubs from damage.

A large and valuable gift of orchids received from J. B. Field, Esq., together with others from the Hon. Mrs. Henry Gladstone, Colonel Rippon, Mrs. Davies Evans, and our treasurer, have emphasised the necessity for a new orchid house, which it is hoped may be built during the coming year.

The value of the research and experimental work carried on in our laboratory at Wisley can hardly be overestimated. The School of Horticulture is also making most satisfactory progress. The results of the 1909 examinations have been highly encouraging, diplomas having been gained by eight out of the nine students who left at the end of the summer as follows:

Diploma Examination (in order of Merit): A. W. Simmonds (diploma and demonstratorship of £40 for one year); W. G. Kent (diploma and prize); J. Ridley (diploma and prize); H. W. Abbiss (diploma and prize); G. A. S. Brooks (diploma); S. B. Gorringe (diploma); H. L. Robson (diploma); N. A. Phillips (diploma). Nicholson prize for observation: A. W. Simmonds. General examination: J. W. McCaig (scholarship, £25 a year for two years, silver-gilt medal, certificate and prize); W. Miles (certificate and prize); W. G. Kent (certificate and prize); H. L. Robson (certificate and prize); A. W. Simmonds (certificate and prize). Certificates were also awarded to twelve other students.

These awards were distributed on October 6 by Harry James Veitch, Esq., V.M.H., who was accompanied by other members of the council, together with the Right Hon. Arthur C. Dyke-Acland, Ex-Minister of Education, who gave a short address. Mr. James Hudson, V.M.H., also gave advice arising from a life-long experience as a practical and scientific gardener.

It was not a little gratifying to find a Wisley student, Mr. McCaig, placed first in the general examination of 291 candidates from all parts of the empire, thereby becoming entitled to the two years' scholarship of £25 a year offered by the Society and the Worshipful Company of Gardeners alternately. For the second year in succession, this distinction has been won by a student of the society. The prize of £5 given by Mr. Hudson, V.M.H., as a memento of his having passed the society's examination in horticulture just forty years ago, deserves a very pleasant acknowledgment. The amount was devoted to prizes awarded to those students who have successfully passed the society's general examination.

In 1910 diplomas are again offered by the council for the students, the following prizes being also available for award, viz.: Mr. Arthur Sutton's prize of £3 10s., to be divided amongst the students at the discretion of the council; and the Nicholson prize of £2 2s. a year, given to the student who shows the greatest power of practical observation on the fauna and flora of the garden and district. A prize of £5 has also been offered by Mrs. G. F. Wilson for the student producing the best collections of dried plants and insects, for which the council sincerely thank her.

Innes' Charity.

An order has been made by the Charity Commission respecting the charities of John Innes, in the parish of Merton, Surrey. The charity provides for the foundation of a horticultural institution at Merton for the promotion of horticultural instruction, experiment, and research. The order institutes a council of twelve representative members, nominated partly by other kindred institutions. The Council of the Royal Horticultural Society obtained the permission of Sir Daniel Morris, K.C.M.G., V.M.H., to nominate him as their representative, and are glad to find that he has at once been appointed vice-chairman of the council of the new institution. Professor Bateson, F.R.S., V.M.H., has been elected director.

Portraits.

It is a matter of great satisfaction to the council to have at last secured a full-length portrait of Baron Schröder, to whom the society has been, and still is, so greatly indebted, and who in our centennial report was justly named "The Father of the Hall," for the existence of our present magnificent building is due to Baron Schröder more than to any other single individual. A splendid portrait of this benefactor (after Herkomer) now hangs in the Council Chamber. Another long-wished-for portrait is also shortly to be hung, viz., that of the late Sir Thomas Hanbury, K.C.V.O., V.M.H., the donor of the Wisley Garden. The original artist of a portrait of which Sir Thomas thought very highly, and now hangs in his famous residence at La Mortola, in Italy, is making a copy, which, on completion, will occupy a place in the Council Chamber in company with the portraits of Baron Schroder and Sir Trevor Lawrence, Bart., our president. Information has also been received that a portrait of Mr. Harry Veitch, V.M.H., by Mr. Hugh Rivière, subscribed for by his friends, is about to be presented to the society. Perpetual memorials will thus be brought within the Council Room of some of the most notable of those who have played a foremost part in bringing the society to its present prosperity and usefulness—men whose memories will always be revered by those who follow after.

Darwin Centenary.

The centenary of the birth of Charles Darwin and the jubilee of the issue of his work, "The Origin of Species," was celebrated last June at his old University of Cambridge, and it was most fitting that the society's botanist, Professor George Henslow, M.A., V.M.H., whose father was a friend and confidant of this great scientist, should have been selected to represent the society at the celebration ceremonies. He was the bearer of an address from the council.

Jubilee of the Fruit and Floral Committees.

The council congratulate the Fruit and Floral Committees on the celebration of their jubilee, an occasion which it was thought fitting to mark by a dinner given to the members at the Hotel Windsor, Victoria Street, on July 6. It is a matter of no little pleasure to note the long uninterrupted service of many of the members of both committees, and the council, on behalf of the Fellows, again extend to them their warmest thanks for the service they render to the society, and the invaluable assistance so freely and generously given through so long a series of years. The council were glad to hear that the Fruit Committee had taken advantage of the occasion to present their chairman, Mr. G. Bunyard, V.M.H., with his portrait.

Entertainment of Germans.

It was with much pleasure that the president and council entertained at luncheon at the Holland House Show, a party of 90 members of the German Society for Garden Art, who were then in London visiting English gardens. The visitors were under the guidance of Herr Fritz Enke, with Herr Beiz, the secretary, and Herr Spath (the son of the renowned German arboriculturist), as interpreter. Our guests expressed themselves more than pleased with the magnificence of the show, and the high excellence of gardening generally in England, and it is hoped they all carried home a pleasurable remembrance of their entertainment at the hands of their British fellow-gardeners.

The Lawrence Medal.

It will be remembered that three years ago a subscription fund was formed to secure a portrait of our president, and for the founding of a medal in his honour. The choice of an artist for executing the medal led to some delay, but eventually the work was entrusted to Mr. Bertram Mackennal, A.R.A., who has worked out an excellent design. The first medal struck was rightly given to our president, whose name it bears. The 1909 medal has been awarded to Lieut.-Colonel G. L. Holford, C.I.E., C.V.O., in recognition of the beautiful exhibits of orchids which he has made during the past year.

Deputations.

It was with much pleasure that the council sent deputations to the following shows in response to invitations received, viz., Berlin International, Birmingham, Gloucester, and Cardiff, in each case being most hospitably and agreeably entertained by the organising bodies.

The council have accepted an invitation from the General Bulb Growers' Society, at Haarlem, to attend their Jubilee Show next spring, and have promised to send a deputation to visit a hardy fruit show to be held at Hexham in the late autumn.

Library.

During the year an opportunity occurred of acquiring a valuable collection of rare old horticultural and botanical books, which had been got together by one of the Fellows of the society—an opportunity which the council were only too glad to embrace. Negotiations are pending with the trustees with the object of uniting the Lindley Library more indissolubly with the society—legal difficulties stand in the way, but there is every hope that the year 1910 will see them overcome, and the union between the Lindley Library and the society placed on a thoroughly satisfactory basis.

Temple and Holland House Shows.

The 22nd Temple Show was a great success, though the continuous rain deprived visitors of much of its usual pleasure. The Holland House Show, in spite of unfavourable weather, has not been surpassed by any previously held by the society. The council extend their hearty thanks to the Treasurer and Benchers of the Inner Temple; and to Mary, Countess of Ilchester, for granting the society privileges, which, we are glad to say, have again been extended for the year 1910.

Masters Lectures.

The foundation of these lectures, in memory of the late Dr. Masters, F.R.S., V.M.H., led the council to invite Professor Hugo de Vries, of Amsterdam, to deliver the first two lectures during 1909, his subjects being (1) "Masters' Vegetable Teratology," and (2) "The Production of Horticultural Varieties." Both were well attended, and are fully reported in the society's "Journal." The Masters' lecturer in 1910 will be Mr. A. D. Hall, F.R.S., of Rothamsted, who will speak on February 22 and March 22 on the "Adaptation of the Plant to the Soil."

Pritzels' "Icones Botanicarum."

This most invaluable book, containing when first published a list of all the known plates and illustrations of plants, has not been kept up to date, and botanists and horticulturists the wide world over are most anxious for a revision brought up to date. The authorities at Kew have been approached by the society during the past year with a view to this being done. The estimated cost is about £3,000, and it was suggested that other societies and Universities should combine with us to provide the necessary funds, the R.H.S. undertaking to give a handsome proportion. Lieut.-Colonel Prain, F.R.S., most kindly interested himself in the suggestion, offering all necessary assistance. It is to be regretted that no further promises of co-operation or of funds have as yet been forthcoming, but all hope of this most-needed publication will not be abandoned. It is quite possible that some generous friend of horticulture and of botany might feel disposed to couple his name with such a permanent and enduring work.

International Exhibition.

From time to time, in recent years, International Horticultural Exhibitions have been held at various centres on the Continent, as at Paris, Berlin, Ghent, Turin, etc. The last occasion on which Great Britain took the part of host in these International courtesies was in 1866, and the council of the Royal Horticultural Society feel that it is time that our country made an effort to return some part of the hospitality which foreign countries have so often extended to us during the forty years which have elapsed since such a gathering was held in London. It has further been suggested that in connection with it a fourth conference should be held on genetics, i.e., on the origin, breeding, and heredity of plants.

Honorary Life Fellows.

Sir William T. Thiselton Dyer, K.C.M.G., F.R.S., and Sir Daniel Morris, K.C.M.G., V.M.H., have been appointed honorary Life Fellows of the society under Bye-law XVI.

Orchid Nomenclature.

The rapidly increasing number of multigeneric hybrids, and the confusion likely to arise unless a definite system of nomenclature is created, led to the formation of a Special Committee to consider what system would be most suitable. Their report has been received; it summarises the opinions of expert scientists and hybridists, at home and abroad, and the council have sent it for consideration at the International Congress to be held at Brussels in April next.

Annual Progress.

The following table will show the society's progress in regard to numerical strength during the past year:

LOSS BY DEATH IN 1909.

		£	s.	d.
Life Fellows	18	0	0	0
4 Guineas	1	4	4	0
2 Guineas	49	102	18	0
1 Guinea	70	73	10	0
	138	£180	12	0

LOSS BY RESIGNATION, ETC.

		£	s.	d.
4 Guineas	3	12	12	0
2 Guineas	168	352	16	0
1 Guinea	401	421	1	0
Associates	23	12	1	6
Affiliated Societies	22	23	2	0
	617	£821	12	6
Total Loss	755	£1,002	4	6

FELLOWS ELECTED IN 1909.

		£	s.	d.
Hon. Fellows	3	0	0	0
4 Guineas	8	33	12	0
2 Guineas	610	1,281	0	0
1 Guinea	584	613	4	0
Associates	26	13	13	0
Affiliated Societies	31	32	11	0
Commutations £404 5s. 0d	16			
	1,278	£1,974	0	0
Deduct Loss		1,002	4	6
Net Increase in Income		£971	15	6

New Fellows, etc.	1,278
Deaths and Resignations	755
Numerical Increase	523
Total on December 31, 1908	10,507
Total on December 18, 1909	11,030

Committees, Etc.

The society owes a constantly recurring debt to the members of the committees, the judges, writers of papers for the "Journal," and the compilers of extracts, the reviewers, lecturers, and the several examiners who, during the past twelve months have done so much to contribute to the potential energy of the society's usefulness, and to help maintain its high standing among the practical and scientific institutions of the world. The council also extend their acknowledgment to the Press for their invaluable assistance in reporting upon and calling attention to, the work of the society.

Income and Expenditure,

From the annual revenue and expenditure account we learn that the income for the year amounted to £23,197 13s. 3d., and of this amount the sum of £15,245 10s. 6d. was received as subscriptions; £2,229 18s. 3d. from shows and meetings; £1,169 10s. 4d. from publications; £2,049 6s. 6d. from hall lettings; and £402 10s. 7d. from the Wisley Gardens. The chief items in the expenditure are: Establishment expenses, ground rent, lighting, rates, etc., £1,637 8s. 6d.; do. do salaries and wages, printing, postages, etc., £4,857 4s. 10d.; Lindley Library, £215 7s. 9d.; shows and meetings, £2,046 10s. 10d.; prizes and medals, £785 11s. 9d.; Wisley Gardens, £1,935 13s.; laboratory, £425 4s. 9d.; depreciation, £502 15s.; and balance, £7,040 4s. 4d. The investments now aggregate £39,980 15s. 3d., and the cash on deposit at the bank and in hand amount to £2,326 4s. 8d. In addition, the depreciation, renewal, and reserve account, which is invested in 3½ per cent. India stock, amounts to £1,478 10s. 2d.

Old Yew Trees.—That there are yews as old as the introduction of Christianity into our island seems almost certain. Dr. Rock took great interest in the matter, and in his "Church of our Fathers" (1st ed., vol. ii., p. 320) he gave a long and valuable note on the subject. He directed attention to the fact that the tree in the churchyard of Aldworth in Berkshire is probably one of the largest in England. Evelyn left exact measurements of some of the most noteworthy yews with which he was acquainted, and I believe he recorded the dates when they were made. At the time that Candolle visited this country he measured these trees once more, and, comparing his measurements with those of Evelyn, came to the conclusion that in this country the diameter of the yew increases at the rate of one line a year. In the summer of 1841 Dr. Rock visited the Aldworth yew, and he found it to have increased half a yard in girth since 1760, when its measurement was given in the "Beauties of England." Dr. Rock pointed out that if it grew with regularity it must have been planted in A.D. 460. As we know from Bede's "Ecclesiastical History" that after St. Augustine came to England it was the custom to appropriate the religious buildings of the pagans to Christian uses, we may be sure that their burial-grounds were taken over also. I believe, indeed, that undoubtedly heathen graves have been found in churchyards, though I cannot at the present time mention a confirmatory instance. When yews were found growing in pagan burial-places, it is most unlikely that they would be destroyed or in any way injured. It is far more probable that the trees would be carefully protected. As there is no doubt that in later times yews were regarded as symbolic of happiness, we may well believe that our Christian forefathers entertained devotion to these stately ornaments of their burial-places, and protected these living objects which filled the minds of so many with thoughts of a blissful future.—Edward Peacock in "Notes and Queries."

JAPANESE IRISES.

The cult of the Japanese irises, particularly the well-known Kæmpferi group, is rapidly extending in this country, and of all the blossoms which make beauty in the summer garden none can surpass in charm or beautiful colourings these wondrous irises of Japan. The lesson from Japan has been well learned, and those iris gardens of the Far East have cast their bewitching influence over the gardens of England. Japan's devotion to the irises is remarkable, and the high place given to the flowers in the temple gardens, and in many others, reaches a culminating point in the beautiful garden of Hori-kiri. Here the glowing masses of the grand Kæmpfer's irises sweep down a delightful valley, forming a picture of unparalleled beauty, of rich colourings, opalescent hues, and dainty shadings, graduating to the whiteness of driven snow. Almost every colour is represented, and in shadings innumerable

The question of reproducing these grand colour pictures in this country rests with the garden maker and decorator. That they are capable of being produced is exemplified by the lake-side plantings at such places as Buckhurst Park and Aston Rowant, the masses at Messrs. R. Wallace and Co.'s gardens at Colchester; at Wisley, at Ranston House, and other places. Certainly these irises are most profuse in blossom once they are established, and the best effects are obtained from well-established groupings, which receive attention at the hands of the cultivator.

It must be borne in mind that these irises are hearty feeders during their period of growth, and, consequently, a good loamy soil, well enriched with cow manure, should be accorded them. Moisture is very necessary, especially during the growing season, and if they are not in a naturally moist position they must be provided with an occasional soaking of water. The best position for the irises is one that combines a sunny exposure with a moist soil. Mulching is of distinct value, and not only assists in the retention of moisture, but also encourages new root formation.

Propagation is usually effected by division, and I have found that clumps of first-class varieties give excellent results if divided directly after flowering. My mode is to lift the clumps, divide them into single crowns, and put each one in a 48-sized pot, using a mixture of good fibrous loam, coarse sand, and decayed cow manure for the operation. A little care in watering will soon result in good stout plants, which fill the pots with their new roots, and are ready for planting out at an early date.

While not wishing to dictate to anyone on the subject of varieties, I would urge the use of the better kinds for garden planting. There is such a wide divergence of colour in Iris Kæmpferi that discretion is certainly needed in selection, though from a good class firm one can usually depend upon being supplied with good forms.

Whites are very necessary in a collection, and some sterling gems, such as Kimono, Sierin, and Samora, should be secured, if possible, while delightful shades are obtainable in Magnifica, white, suffused with palest blue; Britannia, white, veined with rose; Nagasaki, a beautiful lavender, shading to blue; Geisha, the delightful gem in soft and mid blues; Riviera, a deep blue, deepening to violet; Kamada, a grand purple, mauve, and blue; Hana, a bold crimson, toned with purple; Yulan, a rare reddish crimson; Osaka, a lovely ruby, marked with white; and Delicia, a pale blue, shading to white, with lines of mauve. The few varieties denoted are representative of many others, and the reader will find among the Japanese irises a veritable mine of beauty.

The formation of an iris garden, where one can grow so many glorious irises, should be a subject for the consideration of all who have garden alterations in hand. A well-designed garden, with stretches of waterside irises around pools, and spreading through swampy ground, massed groupings of Iris siberica, and a wealth of Iris Germanica varieties, will provide a garden of delight. One can group old favourites and beautiful rarities, and find in them all a source of perennial interest. H. S.

TYPICAL VARIETIES OF IRIS KÆMPFERI
Growing in moist soil and sunny position.

Parsley, being in constant demand, every endeavour must be made to maintain a good supply. Seed for early summer supplies should now be sown in boxes. Place these in gentle heat, and prick off the seedlings into other boxes at two inches apart when large enough to handle; harden off, and eventually plant out early in April in well-prepared ground at twelve inches apart. The present supply should have every encouragement by stirring the surface soil, and adding regular dustings of soot. Keep the plants clean, and remove all decayed leaves. — GEORGE ELLWOOD, Swanmore Park Gardens.

GLOBE THISTLES.

These distinct and hardy flowers are very valuable for certain purposes, and have a good deal to recommend them. They will grow well in any ordinary garden soil, given a sufficiency of moisture, and when once established they need little attention for years, except that necessary to keep them within limits. They provide an abundance of flowers for cutting, and those of a colour of which we have none too many, while the character of the flowers is different from that of almost any other. As commonly grown in gardens, however, they do not show to the best advantage, for, though they require but little attention, they do not generally get that little, and they suffer in consequence, the growths being thin and weedy, and either falling over their neighbours or tied up like sheaves of corn.

The species most generally grown is Echinops ritro, from four to five feet in height, and there is a taller form of this, E. ritro giganteus, growing five to six feet in height, the flowers of which are larger, but it is a matter of opinion whether it is any improvement upon the species. E. ruthenicus, which does not grow quite so tall as E. ritro, is reckoned by some as a variety of the latter, and by some preferred to it. Only one other species need be mentioned, and that is E. sphærocephalus, which, though a handsome plant, with finely laciniated silvery foliage, is devoid of one of the principal charms of the family by reason of its whitish flower heads. The species are similar in character and habit of growth, and there is no need to differentiate between them here, so that they may be spoken of collectively as the globe thistle.

First, as to the uses to which it may be put. It should not be planted in the choicer flower borders, as it is apt to grow very rankly, either smothering its less vigorous neighbours, or starving them out by the absorption of all moisture and available plant food in its neighbourhood. Neither should it be planted in proximity to choice shrubs or fruit trees, as, when once well established, and given a free run, it gets among their roots and is difficult to exterminate. Its best place is in shrubbery borders, where its neighbours can well look after themselves, and in such positions, given liberal manuring and a good start at the time of planting, it proves very effective. Another position in which it looks well is as an isolated specimen in the turf—a big clump in a small bed with the grass growing nearly up to the stems.

One or two points in its successful cultivation are worthy of note, and it is only when grown to the best advantage that it can be recommended at all. Though it will grow in almost any soil, it makes much finer specimens if fairly liberally treated, both in the way of food and moisture, and as the handsome appearance of a well-grown clump is one of its principal claims to notice, this fact deserves consideration. Another thing to be done is to thin out the shoots in the spring, for these come up as thickly as from the crown of a phlox or sunflower, and if all are left weedy growth is the result, with correspondingly small heads of blossom. From a large old-established clump fully half, and sometimes three-fourths, of the shoots may with great advantage be pulled out early in the spring, leaving only the strongest. The plant may look a wreck after the operation, but it will soon pull itself together, and the remaining shoots will grow very vigorously.

The third, and last thing to be mentioned in its cultivation is the matter of tying up. It is rarely one sees a really well-grown clump, owing to bad practice as regards thinning out and tying up. It is a mistake to wait until the plant has gone down in a storm of wind and rain, as it invariably does if left to itself, and it is not much better than leaving it alone to tie it up to a stake in wheatsheaf fashion. If only a few shoots have been left a good strong stick, three or four feet high, should be put to every two or three shoots, which should be carefully tied to it, a further tying up being given when they have grown another foot or so. It will not look at all pleasing at first, but the plant will soon grow together, and will hide all the sticks long before flowering time. This is the only correct way to tie up tall-growing perennials, and I have often given a dozen or more sticks to a single large clump. It takes time, but no other way is so satisfactory. Grown in this way the flower heads will be larger, and, owing to the greater number of side shoots, it will last longer in bloom, and the plant will not be at all unsightly after the flowering time is passed.

The globe thistle is easily propagated. The clumps can be divided by means of a hammer and a cold chisel, or shoots can be taken off the crown in the spring with a little piece of root attached, as with so many other herbaceous perennials. Echinops ritro comes pretty true from seed, and a batch of seedlings I raised early one year flowered a little in the autumn of the same year, and, put out in rows in a nursery bed, made a fine show the following summer.

Alger Petts.

ROSE GRACE DARLING AS A STANDARD.
Grown in the gardens of Sir Richard Poynter, Bart., P.R.A., at Addison Road, Kensington.

A GOOD STANDARD ROSE FOR A TOWN GARDEN.

Many lovers of roses no doubt often feel they would like to grow a few standard roses in their town gardens, but if they live in London they will probably regard the planting of standards as a waste of time and money. The atmosphere of London is not conducive to the best results, and it certainly is useless to plant standard roses unless suitable preparation is made for them, and particularly so unless proper varieties, possesing a fine constitution, are selected. After many years' experience of rose culture in London I can heartily recommend the hybrid tea rose Grace Darling as a standard of great usefulness and beauty. It is an ideal town rose on account of its strong constitution, its freedom of flowering, and its charming colour that seems to appeal to everyone. Though introduced as far back as 1884, Grace Darling is a rose that has not yet obtained the popularity it deserves. It has fine foliage and flowers continuously through the season, and therefore is a splendid variety for London and other town districts. The accompanying illustration shows a standard growing in the gardens belonging to Sir Edward Poynter, Bart., P.R.A., at 70, Addison Road, Kensington, W.; the two fuchsias seen in the picture are of the popular variety Mrs. Marshall.

Kensington. A. C. Hill.

Development of Fruit Culture in Ontario.—According to a statement published by Mr. A. G. Turner, B.S.A.: In 1851, of the land under cultivation in Ontario, an average of $1\frac{1}{2}$ per cent. was in orchard and garden. In 1861, this amount had not increased. In 1871 it had swelled to 2 1-3 per cent., and in 1891 to $2\frac{3}{4}$ per cent. In 1901 to $3\frac{1}{4}$ per cent. These figures show a decided increase in the land under fruit, especially if it is borne in mind that the total land under cultivation has by no means remained constant, and that in spite of the increasing per cent. of all land under cultivation, that under fruit has steadily increased. In 1901 of the $3\frac{1}{4}$ per cent. stated as being in orchard and garden, some 3 per cent. or 279,571 acres were in fruit alone. According to the 1904 report of the Bureau of Industries, since the census of 1901, orchards, gardens, and vineyards in Ontario have increased at the rate of 2 per cent. per annum. Therefore, allowing this 2 per cent. increase for the six years from 1901 to 1907 gives us now a total of about 320,000 acres under fruit in the Province. Again, allowing a 2 per cent. increase, there are to-day planted on those 320,000 acres some 15,094,000 trees compared to the 14,087,936 trees planted on the 297,571 acres in 1901.

SPECIAL REDUCTIONS IN PRICE OF RHODODENDRONS, etc.

We hold the largest Stock of **RHODODENDRONS** in Great Britain, all extra fine, bushy stuff, grown 1,000ft. above sea-level; being recently transplanted are in a splendid condition for removal. Special reduction will be made to clear land of the following:—

RHODODENDRONS, which can be supplied by the hundreds of thousands, in sizes from 1ft., 1½-2ft., 2-2½ft., 2½-3ft., and 3 to 4ft., by the doz., 100, or 1,000 to suit purchasers. **PONTICUMS, HYBRID SEEDLINGS, BLANDUM, CAUCASIAN PICTUM, CUNNS** (white and blush), **JACKSONII**, choice named varieties; extra fine, clean stuff.

AZALEA PONTICUM, 1 to 4 ft., extra fine.

CUPRESSUS, in all varieties, from 2 to 6 ft.

HOLLY COM., from 1, 2, 5, 6, 7, 8, and 9 ft. high; extra fine. **HOLLY HODGENSI, MADERIENSIS**, and **SHEPHERDI**, in all sizes.

LAURELS in variety, from 2, 3, 4, 5, 6 ft. high.
YEWS, ENG., from 1, 2, 3, 4, 6, 7, and 8 ft. high; extra fine stuff.

ORNAMENTAL TREES, FOREST TREES, PLANTS FOR HEDGES, GAME COVERTS, ETC., in large quantities.

We extend a Courteous Invitation to Inspect our Nurseries, 300 acres in extent.

TWERTON HILL NURSERY BATH.

NEW PLANTS, ETC.

◆

ANGULOA CLIFTONI.

This is a wonderful and new species from Colombia. The flower is large, very distinct, and striking. The broad and pointed sepals are of curious shape, all concave, and of a light greenish-yellow shade. The petals are also very broad at the base, and pointed at the apex, pale yellowish-green, heavily stained at the base with bright purple-red, and netted and spotted with the same colour on the upper portion. The basal colouring shows right through each petal. The articulate lip is yellow, shaded with brown, and the column is white. The flower is very fragrant. (See illustration on p. 83.) F.C.C., R.H.S., January 25. Messrs. Charlesworth and Co., Haywards Heath.

CATTLEYA MIRANDA WESTONBIRT VAR.

This is a fine variety of the hybrid between C. Trianæ and C. amethystoglossa, and differs from others in its larger size and finer colour. Sepals and petals are rich rose-purple, with a deeper shading along the latter. The lip has a fine crimson apex, and a yellow disc. A.M., R.H.S., January 25. Lieut.-Colonel G. Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester.

CATTLEYA TRIANÆ MAGALI SANDER.

A superb variety and of especially fine size and form. The sepals and broad petals are pale lilac, and the lip is of the same colour, but has a large crimson-purple apex and yellow throat. A.M., R.H.S., January 25. Messrs. Sander and Sons, St. Albans.

CYPRIPEDIUM LORD WOLMER.

A very handsome cypripedium, obtained by crossing C. Leeanum Clinkaberryanum with C. Euryades. It has a very large, rounded, and bold dorsal sepal, white, with greenish base, and freely spotted all over the centre and base with bright purple. The petals and lip are green, shaded with brown and dull purple. If the petals had been a trifle broader the flower would have been perfect, from a florist's point of view. A.M., R.H.S., January 25. H. J. Bromilow, Esq. (gardener, Mr. W. J. Morgan), Rann Lea, Rainhill, Lancs.

MAGNOLIA DELAVAYI.

Though not hardy in the open air, this fine, broad, evergreen magnolia will thrive against a sheltering wall in the southern counties. It comes from Yunnan, at a considerable altitude, and was introduced to cultivation by Messrs. James Veitch and Sons, through their collector Mr. E. H. Wilson. Magnolia Delavayi is a shrub or small tree, and bears ovate leaves seven to thirteen inches long, and four to seven inches broad. The big creamy-white flowers are composed of three sepals, and about seven petals, the former reflexing, and the latter incurving. All are from one and a-quarter to two inches broad, and from three to four and a-half inches long. It will thus be seen that the flower is large and attractive. "Bot. Mag.," t. 8,282.

PIERIS FORMOSA.

Hailing from the Eastern Himalayas, this fine flowering shrub has been in cultivation for about half a century. It will withstand all but the severest of winters, but is seen at its best in the south-western counties, where it becomes a small tree. The spreading, branching, and drooping panicles carry a profusion of small, urceolate flowers, white or rose tinted, and these appear in the spring time. "Bot. Mag.," t. 8,283.

COTONEASTER MONPINENSIS FLORIBUNDA.

A handsome and very useful dwarf shrub from Western China. The leaves are dark green, and roughly hairy; the tiny reddish flowers are borne in little corymbs, and followed by brilliant red fruits. The latter are so numerous and effective that the shrub is a great attraction during September. "Bot. Mag.," t. 8,284.

CEPHALOTAXUS DRUPACEA.

Closely allied to the common yew, this shrub is of bolder habit and leafage, and has large fruits. It is evergreen, and is a success in the shadier parts of the garden, thriving also as undergrowth in thin woods. It loves plenty of moisture, and, consequently, is at home in the south-western counties, and in some parts of the Thames Valley. "Bot. Mag.," t. 8,285.

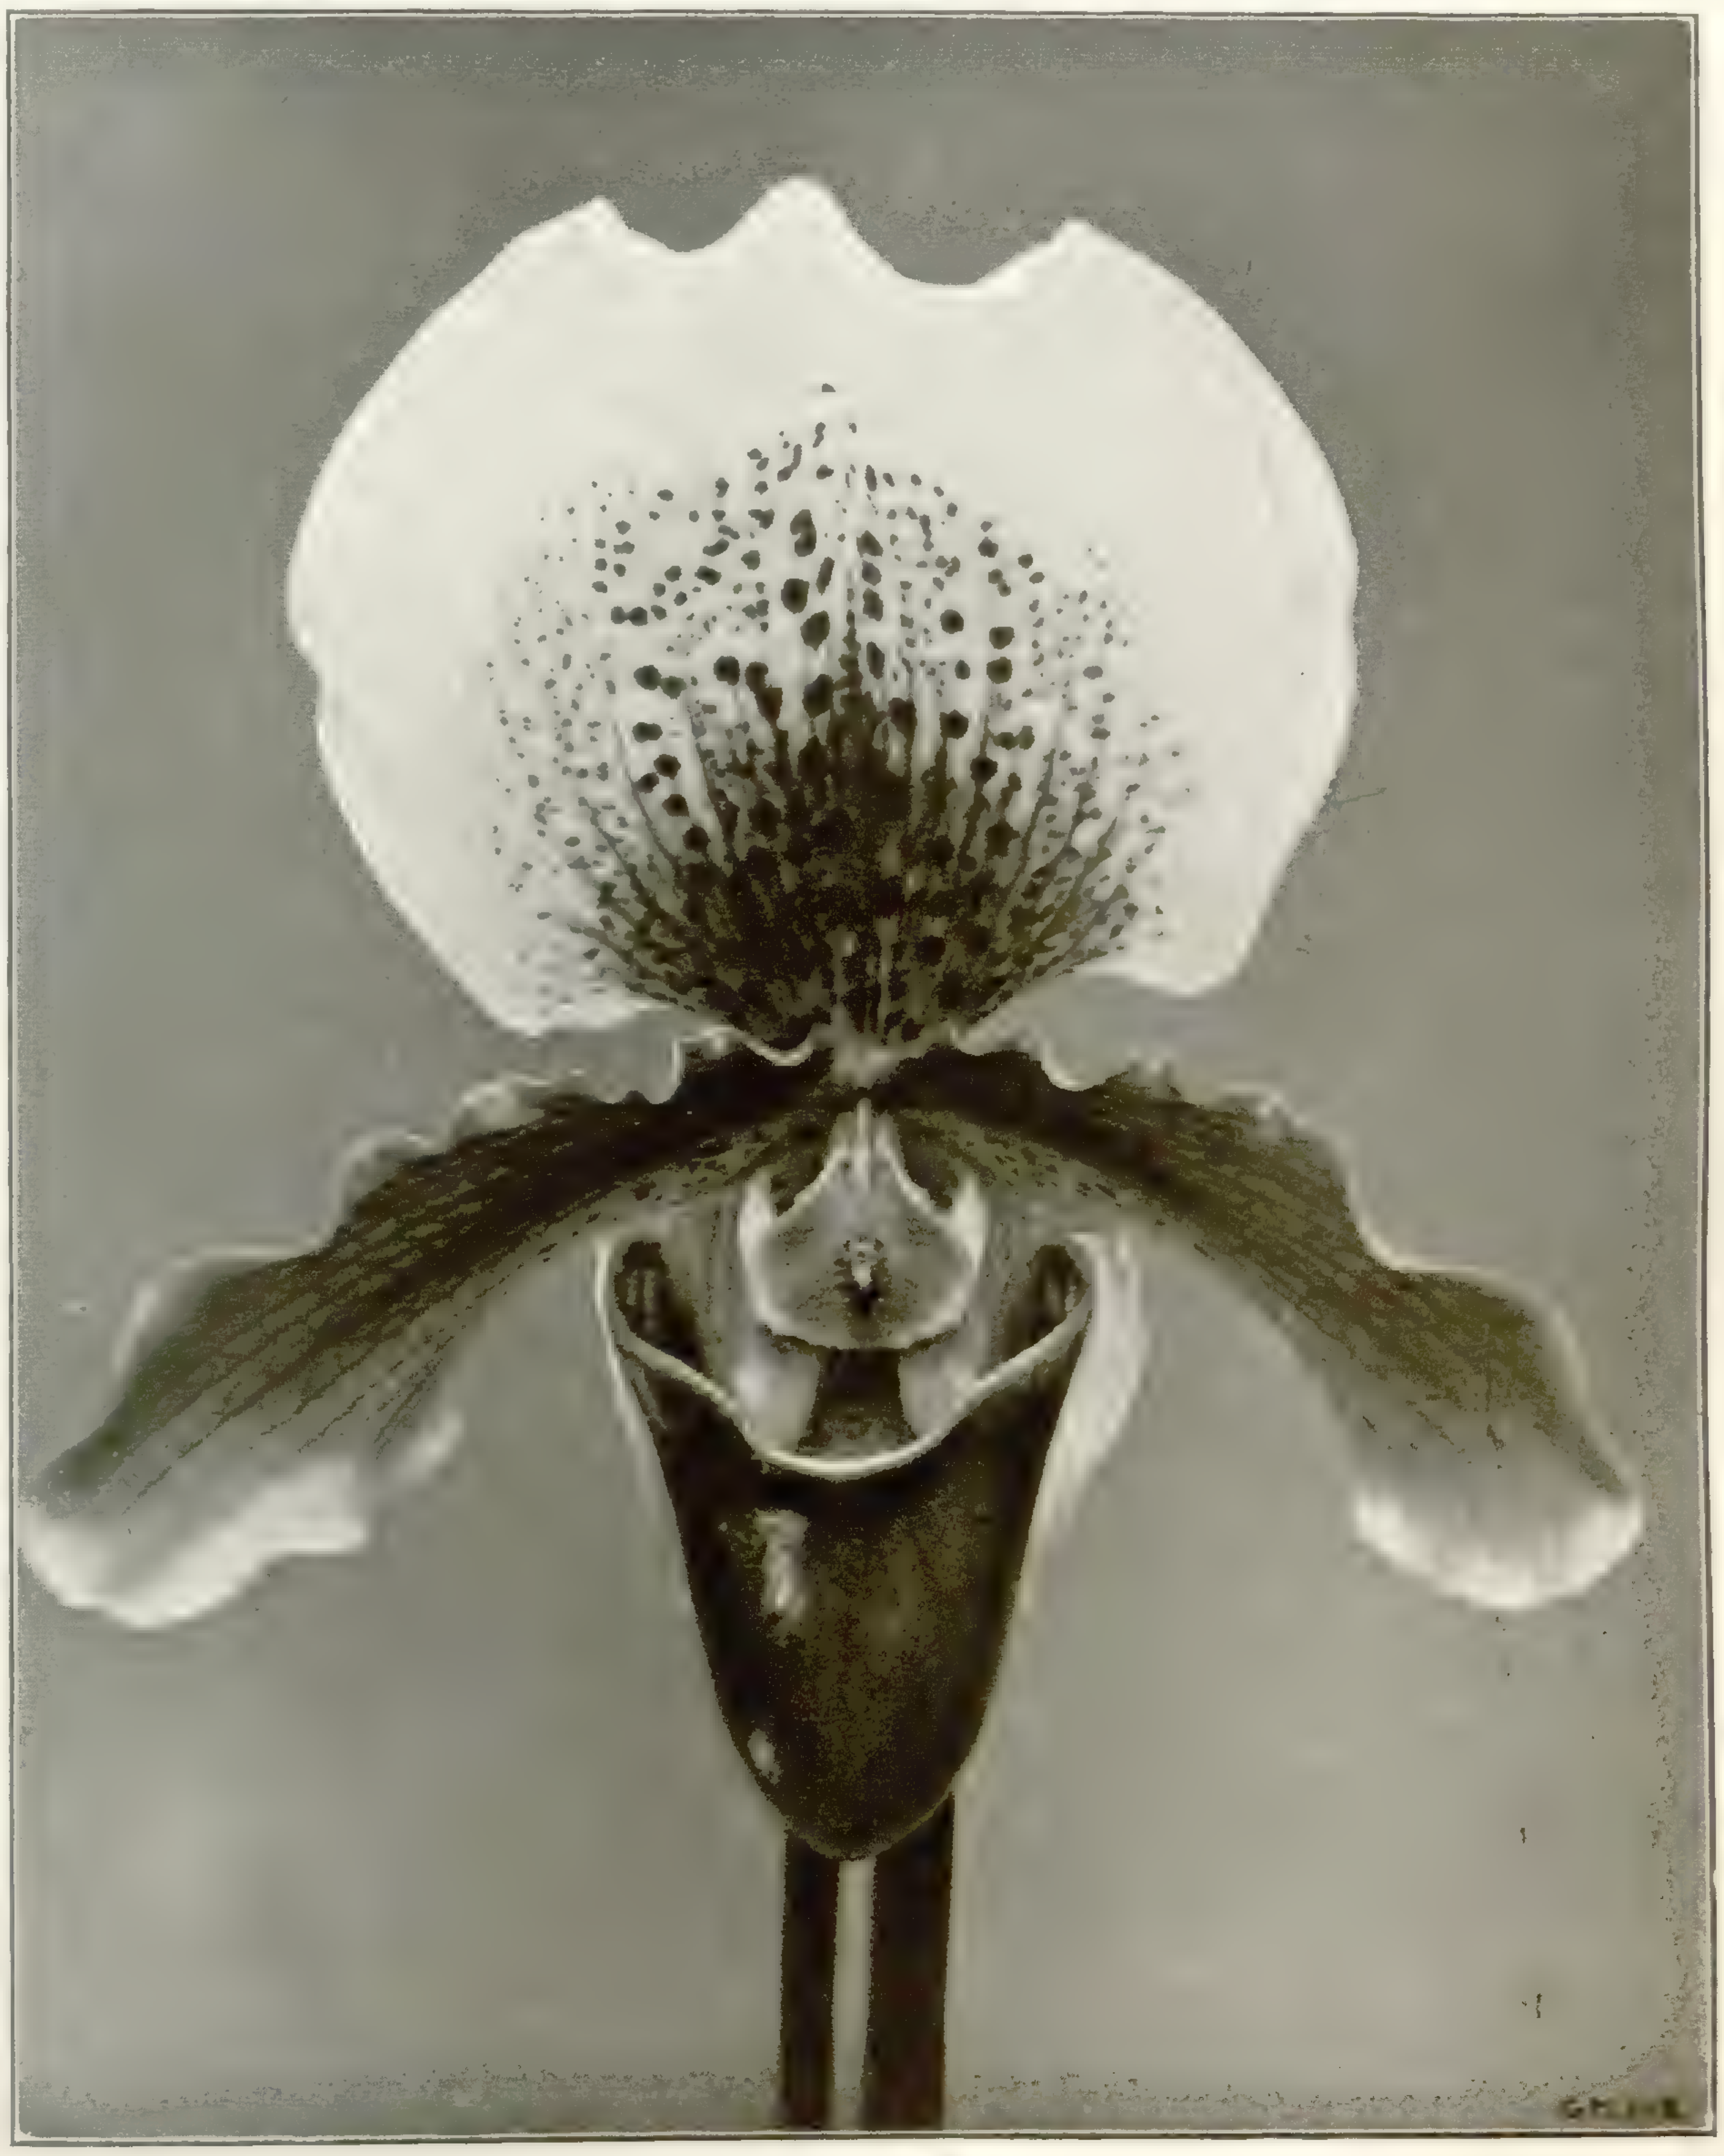
GUTHRIE'S VARIEGATED ROCKFOIL.

There exists in comparatively few gardens a very beautiful saxifrage bearing the name of Saxifraga Guthrieana variegata, about whose original history one would gladly know a little, as its origin seems lost in the distant past. It has been known to, and admired by, the writer for many years, and, so far, it may be suggested that it originated in the North, as it has been principally distributed from nurseries in the East of Scotland. Whatever its history, it is the prettiest of all the variegated rockfoils, and a good plant, with fully developed rosettes, is extremely pretty, with its green and white markings regularly arranged along the leaves. According to the works of reference, S. Guthrieana is referred to S. Andrewsi, but I have never met with a green-leaved plant under the title of S. Guthrieana, and S. Andrewsi is understood to be a garden hybrid between S. geum and S. aizoon. It is thus probable that S. Guthrieana variegata is either a sport or a seedling of S. Andrewsi, and it has all the qualities of that good rockfoil, with the added virtue of a distinct and permanent variegation, as, unlike the variegated varieties of S. umbrosa, it never appears to revert to the green form.

Guthrie's variegated rockfoil forms good rosettes of substantial, rather spathulate, or lingulate leaves, and from these rise, on six-inch stems, pretty little flowers of white, spotted with red. The main beauty of the plant, however, lies in its variegated leaves. It is increased by taking off the offsets, which generally root fairly well while on the parent; but, if increase is wanted, it is well to take them off and to put them singly into small pots, or in lines in the reserve garden, shading them for a little until they take root. By this course of procedure strong examples are obtained for planting in the permanent positions.

In some gardens the birds have a particular liking for pulling up the rosettes of S. G. variegata, and I have sometimes found it necessary to protect them from their feathered enemies. Such a good and distinct rockfoil is worthy, however, of a little care.

S. Arnott.

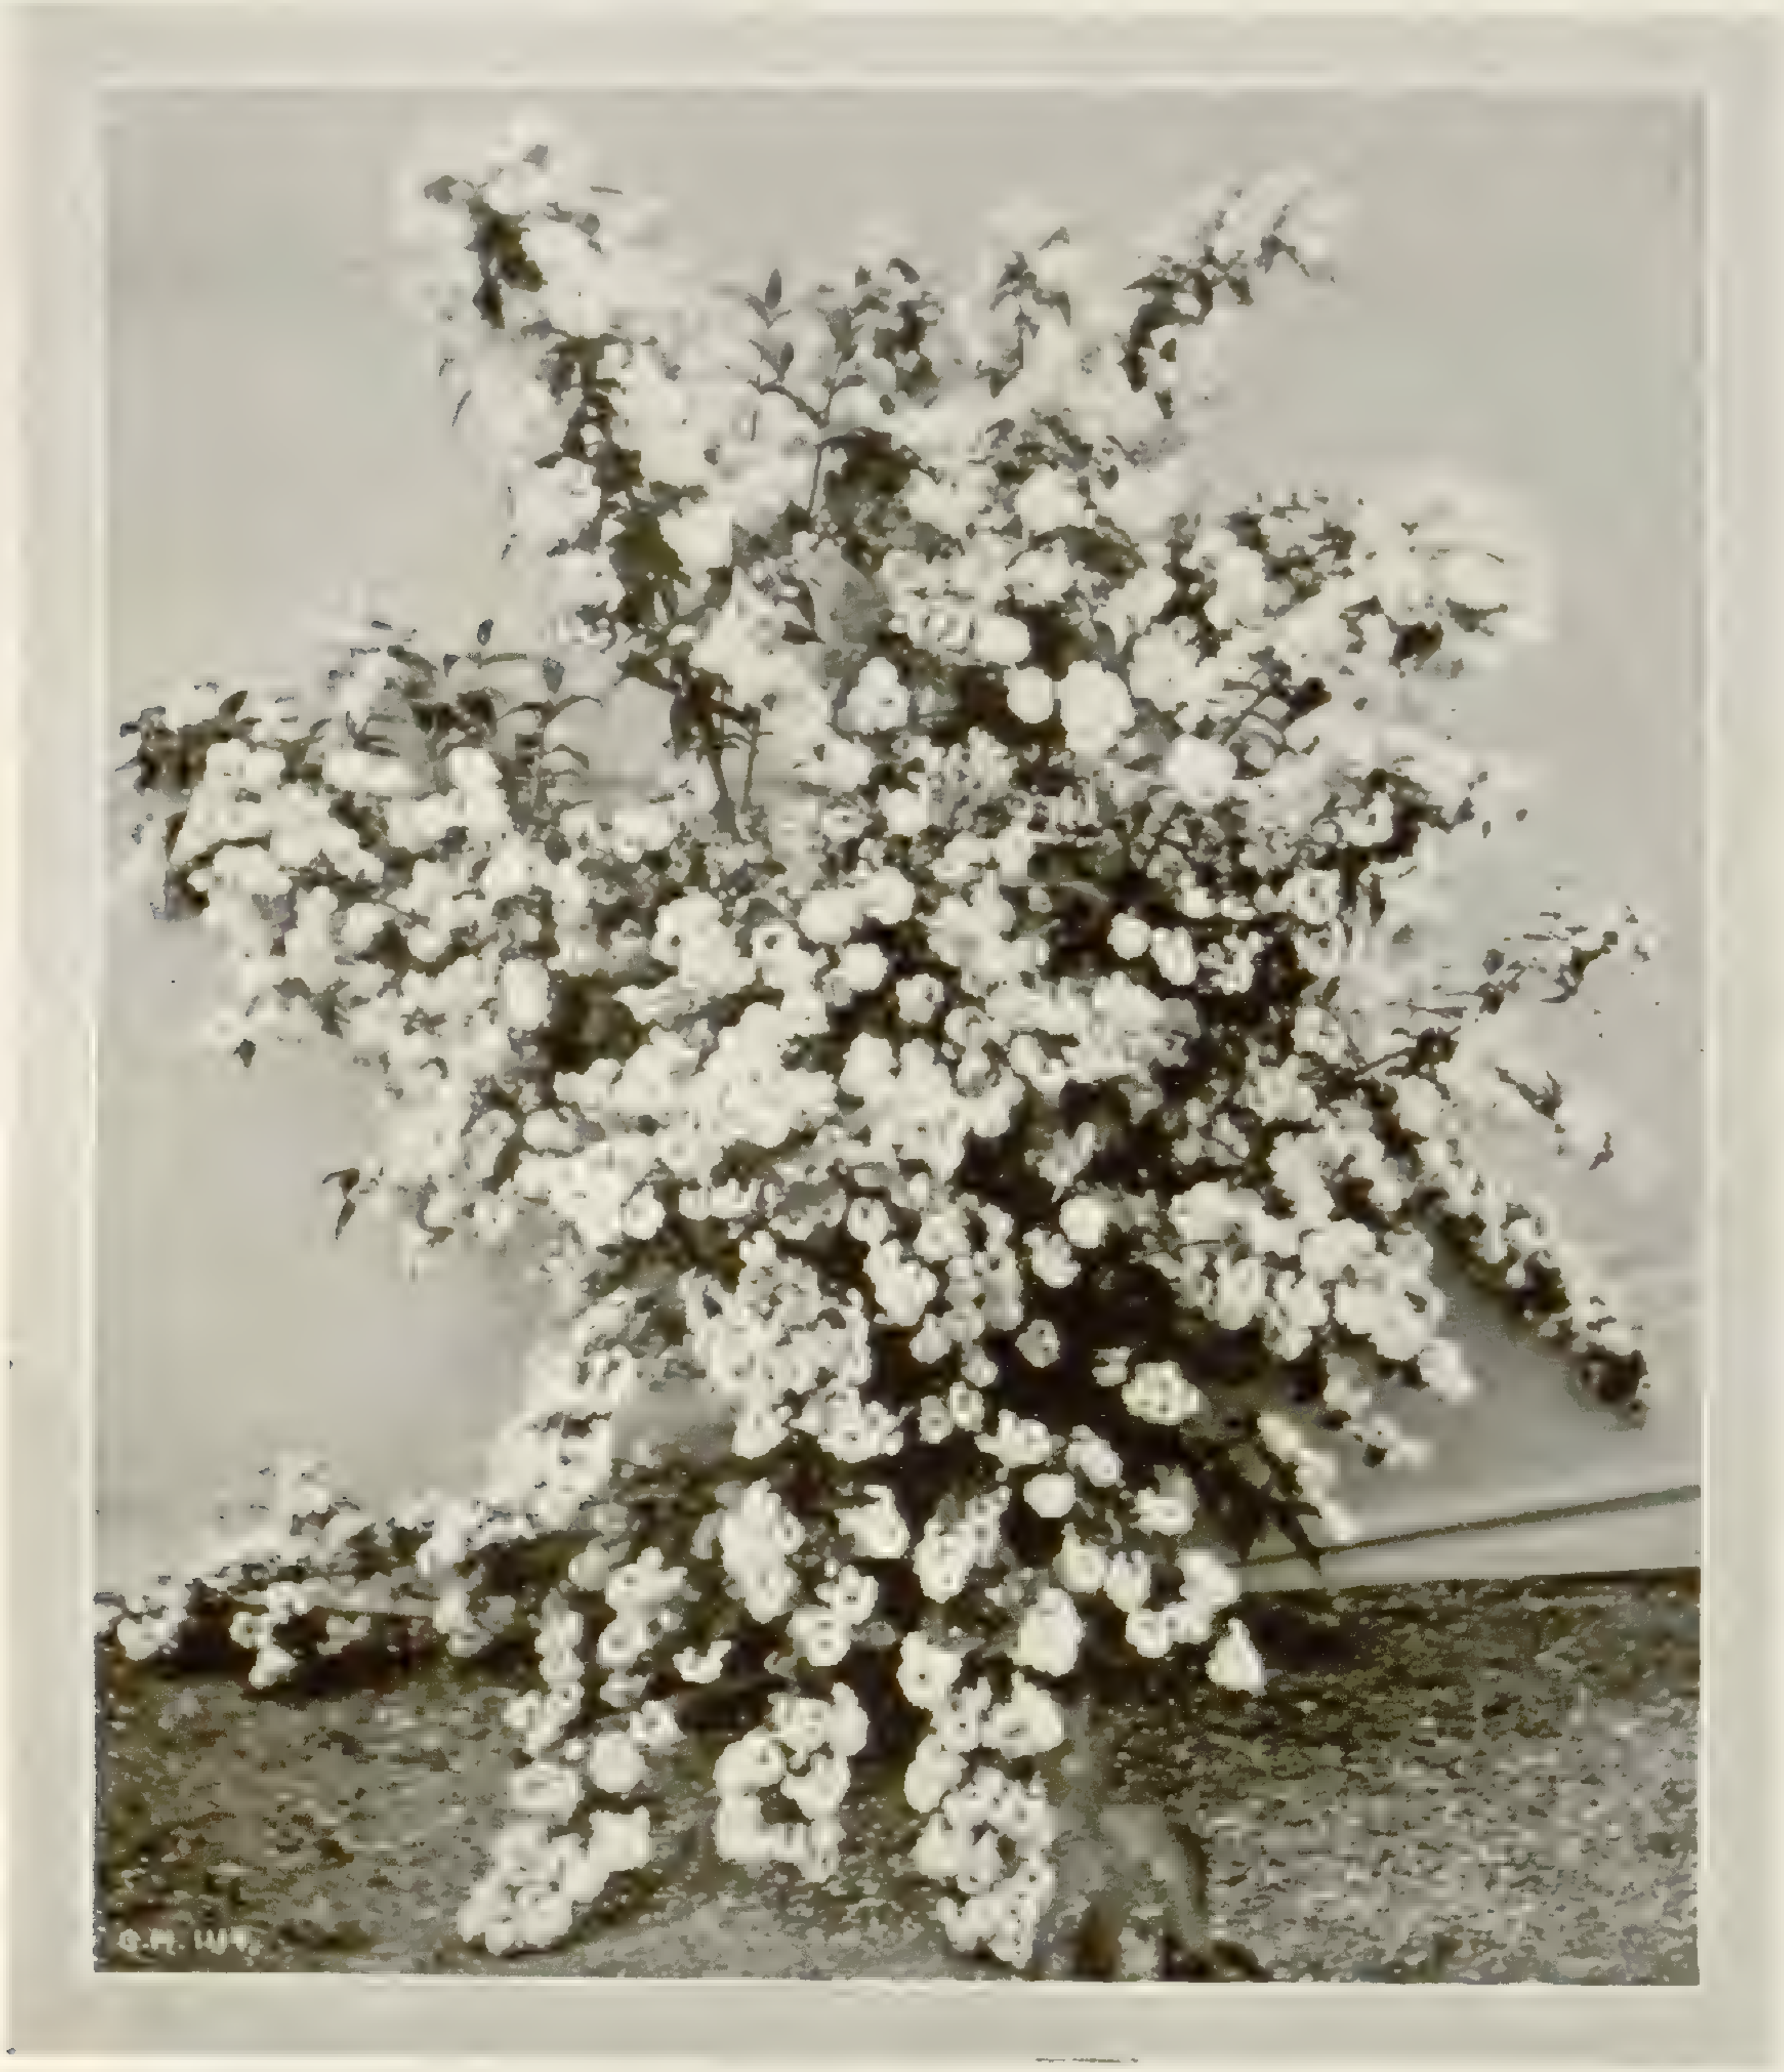


CYPRIPEDIUM LORD WOLMER.

Flower white, green, and purple. A.M., R.H.S., January 25. Mr. H. J. Bromilow, Rann Lea, Rainhill.

AMONG THE NEWER DEUTZIAS.

The beauty and grace of the older deutzias ensured them a place in nearly all gardens where flowering shrubs are appreciated. Perhaps the most popular group for outdoor cultivation is the ever useful D. crenata and its varieties, which rank among the prettiest of flowering shrubs for border and shrubbery plantings. For greenhouse and conservatory adornment the well-known D. gracilis and its varied forms have long held the field, being decidedly light and graceful in contour, very floriferous, and readily amenable to gentle forcing. It would be extremely difficult to compute the number of the gracilis section which are grown for indoor decoration, but it must be exceedingly large.



DEUTZIA CRENATA MAGNIFICA.
A beautiful variety, bearing a profusion of double white flowers; raised by M. V. Lemoine.

The discolor group provides very good decorative subjects, and the newer hybrid varieties are especially noteworthy. As regards outdoor culture the majority of the deutzias will thrive admirably in the southern portions of Great Britain, but in the colder north, only the hardier types should be attempted outside, such typical forms as D. crenata and the strong growing D. scabra doing fairly well with a little shelter.

Where one can plant deutzias, with the knowledge that they will do well, then informal groupings in the grass, or on an open bank in the wild garden should be the aim. Even well-grown single specimens look charming isolated on the lawns, and some of the newer forms will prove of great value. It may be of interest to the reader to know something of the newer hybrids, especially as they are so charmingly adapted for widespread culture, and may maintain the future popularity of the race.

Taking D. crenata first, one notes the delightful D. candidissima flore plena, a fine, graceful, pure white subject. Pride of Rochester, a grand pure double white, extremely well adapted for forcing; Rosea flore plena, a notable form, with rosy markings upon the white blossoms; and Watereri, the fine single white.

Fine progress is being made in the D. discolor group. The fine form, D. discolor major, which was introduced by Messrs. Veitch from Central China, has been followed by a charming series of hybrids from Messrs. Lemoine, of Nancy. D. discolor grandiflora is a fine seedling from D. discolor purpurascens, which was crossed with D. gracilis. It is of dwarf habit, with delightful panicles of blossom which exceed in length and beauty the first-named parent. The fairly open blossoms are remarkable for their large, pointed petals, while the colouring is pure white tinted with rose. The buds and the reverse of the blossoms are rose-coloured. D. discolor purpurascens, crossed with D. scabra, has produced the sterling D. arcuata, which differs from any other deutzia in cultivation in its spreading habit and foliage of a dark shade of green. The innumerable bunches of pure white erect blossoms give it a glorious effect, and the individual flowers are of good size, and their beauty is increased by the crown-like formation of the stamens.

By crossing D. scabra with D. discolor grandiflora some fine novelties have been obtained. D. discolor densiflora is an erect-growing variety, with a floriferous character. The blossoms are white, suffused with rose, and, with the sulphur-coloured anthers, create quite a pretty effect. Another fine variety is D. carnea, a delightful flesh-coloured form, with rosy-pink reverse to the blossoms, which are of medium size. The petals are oval, and the carmine bud-colouring is very pleasing. D. lactea, a dwarf bushy hybrid, with grand panicles of blossom, and a clear milk-white colouring is deserving of notice, while the dainty D. stellata is an exceedingly pretty hybrid, the flowers exhibiting a delightful blend of colouring, shading from palest pink to rosy-carmine.

Some exquisite beauties are now grouped in the D. gracilis section. There is the snow-white D. erecta, a hybrid between D. gracilis and D. Sieboldi, with dark green leafage, and pyramidal spikes of blossom. D. campanulata is a grand milk-white form, wonderfully free and effective in blossom. D. candelabrum, another D. gracilis x D. Sieboldi hybrid, is a delightful subject. The arching branches, clouded with innumerable clusters of creamy blossoms, makes an undeniably charming picture, and is well worth securing. In D. carminea we have another pleasing deutzia with an arching habit, the branches being weighed down with the burden of rosy-hued blossoms. D. eximea and D. rosea furnish two more pink varieties to the gracilis group, while the large-flowered D. venusta, with snowy blossoms like a miniature azalea, concludes a group of sterling forms of this favourite section.

Further, there is the Lemoinei group, of which the forerunner was the handsome white-flowered D. Lemoinei, a hybrid between D. gracilis and D. parviflora. The best of the section are D. Avalanche, a handsome snow-white hybrid with the close panicles of blossom crowding closely for the full length of the stems; D. Boule de Neige, a large-flowered showy white of great merit; D. Boule Rose, with pale rose blossoms, produced in large close clusters; and D. Fleur de Pommier, a notable pale pink form, clad from base to summit with axillary corymbs of blossom. Both in bud and blossom it is delightful.

That other good work in connection with the deutzias is in progresss is apparent in D. kalmiæflora, a fine hybrid, with kalmia-like blossoms of a pale pink colour; and in the fine D. crenata magnifica, a hybrid between D. Vilmorinæ and D. crenata candidissima plena, which has been raised in Messrs. Lemoine's establishment at Nancy. The appended illustration gives a vivid reproduction of what should prove to be one of the most popular flowering shrubs of the future. The pleasing habit, the wealth of double snow-white blossoms, and its delightful appearance, are certainly greatly in its favour. With such a pleasing novelty before us, we may rest assured that there are good things yet to come from the deutzias, and this knowledge should give a fillip to this most deserving race of flowering shrubs.

P. S. Hayward.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price 1s. 6d. net, by post 1s. 9d.; cloth, 2s.; by post 2s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

CULTIVATION OF THE VINE.

Modern day methods of horticulture have greatly facilitated the culture of the grape vine. The influences and beneficial results of increased knowledge, inexpensive means of heating, and more suitable and adaptable structures are made manifest in the enormously increasing amount of grapes available for market purposes, in their comparative cheapness, and in the vast number of gardens wherein their cultivation is an established factor. There seems no doubt that the present-day methods of preserving grapes of all kinds has contributed in a great measure to this welcome state of affairs, the rich luscious flavour of this fruit being unrivalled by any other edible kind.

The modern gardener who is at all ambitious and eager of success, will realise that a knowledge of vine culture constitutes an essential factor in his store of horticultural learning; there are few gardens of any extent where a large area of glass is not devoted to the cultivation of the grape, and this department calls for his most careful and unremitting attention.

Vineries and Borders.

In the vast majority of gardens, vineries are already established, and it will therefore not be necessary to describe the structure of such buildings. Suffice it to say that among the most common form of houses are lean-to's, three-quarter spans, or hip-roofed vineries, and perhaps the most common of all, and that chiefly favoured by market growers—the span-roofed house. Lean-to's, if facing south, have an ideal aspect, and are to be preferred for the forcing of early grapes, being more accommodating in the matter of warmth and the amount of necessary fixing.

The inside borders and rooting mediums deserve great attention; the former should be excavated to a depth of about 3½ft., and should be at least 10ft. wide. A layer of 4in. of concrete or paving should be placed in the bottom of the border, which should allow of a slight fall to the front and the outlets, the latter being provided at each end, leading into the main drain. A 5in. drain pipe laid along the front must connect with several smaller pipes of a 3in. section, placed obliquely across the border, and the whole should be covered to a depth of 6in. with brick rubble, and that in turn with turves cut from an old pasture, placed grass side downwards.

Soil and Planting.

The soil most suitable for vines is a yellow fibrous loam, which should be chopped up roughly; an ideal compost can be formed by the admixture of one to six parts of lime rubble, a sprinkling of charcoal or wood ashes, and 2 cwt. of 2in. bones. The soil, if of a sandy nature, will necessitate less lime rubble, as the object of this is to increase the porosity. Manuring or top-dressing is best performed during the growing season; dissolved bones or potash are of valuable service in renovating the soil, and will have lasting effects if applied judiciously. The borders should be prepared in advance, and made up piecemeal; they must also be thoroughly consolidated in order to secure that firmness of texture so essential for the development of hard nut brown wood and buds.

The middle of March is the most opportune time for planting with canes of the previous season's growth. If proper attention is given as regards heat and moisture, the vines will make excellent growth during the summer, and in order to allow a sufficient space for the free development of the lateral shoots, the canes should be planted at from 4 to 5ft. apart, though these dimensions are, of course, dependent upon the system of training which is adopted. When taken out of the pots, the young shoots should be immersed in a tub of tepid water in order to disintegrate the soil particles from the roots, and when planted in the border the roots should have a quantity of fine soil worked in amongst them, filling up the border with the approved quality of soil. At this stage a liberal watering must be given with lukewarm water, and a mulching of well-decomposed horse manure applied. Eyes for future planting should be inserted in January, and must be turned out of the pots before the roots become matted. After planting, the border should be filled up to a depth of 2½ft., an extra foot being allowed for Muscats.

DEUTZIA DISCOLOR DENSIFLORA.

A handsome variety, free blooming, and bearing single flowers that are white suffused with rose; raised by M. V. Lemoine.

Temperature.

The great variety of circumstances to be encountered in the cultivation of the vine do not admit of any definite mode of treatment or management in general being outlined, and it therefore is necessary to pay careful attention to the prevailing conditions of climate and temperature, etc. At the commencement, a temperature of 50 deg. should be maintained at night time, which should be allowed to rise 10 to 15 deg. during the day; as the vines pass the various stages towards the period of flowering, the temperature may be gradually raised, until at that stage, it should stand at 65 to 70 deg., these temperatures representing the maximum and minimum during the night, with a corresponding rise during the day. It must, of course, be understood that the prevailing weather conditions enter largely into consideration when determining these temperatures. When the grapes are fully set the temperature may drop to 60 deg. and under all circumstances the cultivator must be careful not to overheat the pipes, as this constitutes a sure forerunner of red spider. The sun's heat should be utilised as extensively as possible, as this is an eminently preferable form of heating to any other sources of an artificial nature.

Ventilation and Moisture.

Fresh air is as necessary an adjunct to vines as it is to human life, and should therefore be supplied in sufficient quantities by judicious ventilation. The night temperature is regulated by artificial heat, but during the day ventilation on approved plans secures an even and suitable temperature. It therefore follows that air should be admitted, not with the object of lowering the temperature, but in order to keep it from rising too high. A sudden inrush of cold air is most disastrous to the tender foliage of young vines. As the grapes commence to colour, air should be admitted freely both by night and by day, and many successful growers are in the habit of admitting fresh air at night time, whenever the state of the weather warrants it, beginning at the commencement of the blooming period.

A moist, genial atmosphere is necessary in order to maintain a healthy growth; the rods should be lightly syringed three or four times a day, the object of the moisture being to induce the growth of buds, and afterwards to supply nourishment to the plant through the leaves. When the vines are well in leaf syringing should be discontinued, and a slight damping of the rods will suffice, while at the advent of the period of blooming a somewhat drier atmosphere should be maintained until the grapes are set. The presence of lime in the water will have an evil effect upon the berries, causing them to become spotted and soiled. Every portion of the house, the border, walls, and floor, etc., must be kept in a humid condition at this period, until the grapes commence to colour, when a drier atmosphere may be maintained, and, when fully ripe, the air should be kept as dry and bracing as possible.

Pruning and Training.

Many cultivators of expert knowledge and experience affirm that spur pruning is to be preferred to any other method of cutting, and, indeed, it may be assumed that this is the most common form of pruning which is practised. At the commencement, young vines when first planted should have been cut back to within three or four eyes from the ground; from this stage onwards their growth should receive every encouragement in order to produce an abundance of foliage, the presence of which denotes a more extensive growth of roots. At the first winter pruning the canes should be shortened to within three feet from their point of origin, and in order to encourage a well-balanced development of buds the canes should be placed in a horizontal position. When the lateral growths are established they may again be placed in the perpendicular, and selection can then be made of the leading shoots, chóosing those of healthy and vigorous action, the distance between each one being about fifteen inches. These shoots will form future fruiting spurs, and all intervening buds should be removed.

After prunings will consist of shortening the lateral growths to a good round plump bud as close as possible to the main stem, the same system of pruning being followed year by year.

As regards training, it must be remembered that the vine is a free-growing plant of climbing propensities, supporting itself when in a free and natural state by means of its tendrils, consequently, when subject to close cultivation, it demands some artificial means of support, and this can be afforded in many ways. In this country a wire trellis is perhaps the commonest means of training vines, the wires being fixed at a distance of not less than twelve inches from the roof, or six inches from walls.

Experience.

(To be continued.)

SELECTIVE FERN BREEDING.

When we have an opportunity of inspecting some of the best collections of British fern varieties we cannot fail to be impressed with their wonderful capacity of improvement by selective cultivation through their spores. Nature, indeed, has been lavish in the provision of beautiful types as spontaneous wild sports, and it is entirely upon these types that we are dependent for a start in selective culture. It would be simply ridiculous to attempt to originate varieties by sowing wild normal forms, for although there would, of course, be the same chance of a deviation cropping up as there is in the wild state, the numerical proportion is many thousands to one, and the chance of success the same as regards any sport at all, while it is immensely decreased as regards a really fine type, since many inferior ones are found for one fine acquisition.

Even in collections embracing a large number of forms sufficiently good and distinct to be worthy of a place, the abundance of material is such that attention should be concentrated only on the best forms, whose symmetry and constancy and beauty are such as to eclipse most of their fellows. By utilising these we obviously start to the best advantage, and from such material every now and again the most startling results may be obtained, altogether surpassing the most sanguine expectations.

In the history of British fern selection we have three marked examples of this, viz., the beautiful moss-like plumose section of Polystichum angulare raised by Colonel Innes and Dr. Fox, the unique superbum section of Athyrium filix fœmina raised by the writer, and the gracillimum section of P. aculeatum raised jointly by Mr. C. B. Green and the writer quite recently. The first-named section arose from a sowing of spores from a decomposite wild find by Mr. Moly, of a sufficiently promising character in the way of extra cutting to induce the experiment. The result, a batch of densely plumose forms rivalling Todea superba in beauty, was so unexpected that neither Colonel Innes nor Dr. Fox could credit the parentage until a second trial confirmed it by similar produce. Those ferns have ever since constituted the cream of the species, and although rivalled in their own line by subsequent production of varieties known as Esplan and Grimmondiæ, the origin of both these is by no means clear, and it is quite possible that their source is identical with that of the others. P. angulosum plumosum Pearson, a worthy rival too, arose from another decomposite form, which, curiously enough, yields from its spores the parent form true, a curious grandidens type, and last, but not least, the Pearson plumosum aforesaid.

The superbum Lady Ferns present a still more striking example, and in the extent of variation in one batch is certainly unique. The original wild find was discovered at Axminster, a fine plumose form. Its spores yielded an improved variety called A. f. f. plumosum elegans Parsons, more finely cut. Owing to bulbils being discovered on the frond backs, a piece of a frond was sent the writer for inspection, and, as there were spores, a sowing was made. Up to this time there had been no trace of cresting in Parson's form or its wild parent, but this sowing yielded over 90 per cent. of crested forms, all similar, but mostly depauperate here and there. Only two Parson's elegans appeared, and only two perfect crested forms, one of which was very fine, and was named superbum. The next thing, of course, was to sow superbum, and now a most wonderful batch of plants was obtained, two distinct sections, crested and uncrested, arising. No two were exactly alike, and about a score of distinct and new plumose varieties were obtained. Among the non-crested forms one stood head and shoulders above the rest, plumosum Drueryi, extremely robust, and finely cut, and in the best of the crested forms, superbum percristatum, even the pinnulets are tasselled, so that no other crested form approaches it. In this case, therefore, two distinct sections were arrived at in the second generation from the elegans variety, and the third from the original sport.

The progeny of the third example, P. aculeatum pulcherrimum, is remarkable on somewhat different lines. The parent may be described as a refined sport of P. aculeatum, with slenderer pinnules, and an unique incurving and lengthening of the terminal pinnæ, which overlap to form a peculiarly graceful terminal. For some forty years the plant was reputedly barren, or, at any rate, no sowing had yielded results, but, a few years back, spores were definitely seen and sown, with the wonderful result that at least twenty plants appeared among about a hundred, in which the parental half-inch pinnules were narrowed and lengthened, in some cases to two to three inches, transforming the fronds entirely, and giving us what we may term a gracillimum section, though no two were exact replicas, and one of Mr. Green's has yielded a fair rival in aculeatum to the Jones and Fox plumose angulares. Fortunately, despite their delicacy of cutting, all these appear to be of robust constitution, and it still remains to be seen what several of the batch will do when fully grown.

We have here then three cases where selection has given the fortunate breeder a range of new plants, far and away surpassing any which Nature has provided in the form of wild sports. There is, however, no reason at all to doubt that a similar capacity exists in other wild finds. In the Lady Ferns, for instance, we have rivals to the Axminster plumosum in the Horsfall, divaricatum, and Willsi plumosums. The beautiful silken hair-like Kalothrix was raised from a merely plumose form. In the polystichums we have Wollaston's and Moly's plumosums well worthy of attention, and, in short, whenever a thoroughbred symmetrical and constant wild sport is found sowing should never be neglected, with a view to improved results.

The beautiful section of fringed crispum Hartstongues of Stansfield came from a wild find of undulatum, and in the writer's hands, a merely sagittate lobate find of the same species yielded a number of heavy trilobed grandiceps from the spores of the plant when found, i.e., wild spores. A word of warning may be given in this connection, and that is to exclude as far as possible stray spores from special sowings, and when young plants appear to eliminate the obvious strays, and, later on, isolate by pricking out the most promising forms, so as to save them, as far as practicable, from competition with inferior, and probably more robust growing companions of alien kinds. We once sowed a rare variety, and it was only after eradicating three crops of stray Lady Ferns by cutting out with scissors, that a crop of the desired species could assert itself. 300 plants then rĕsulting. The frond sown from must have been thickly peppered with stray spores.

Chas. T. Druery, V.M.H., F.L.S.

YELLOW ARUMS.

A peculiar charm invests the yellow arum, to which the average gardener readily succumbs. The chaste white Richardia africana has been familiar to generations of gardeners, and it cannot be displaced even by the charming newcomers. The cultural requirements of the white and yellow kinds is entirely at variance, inasmuch as the period of greatest activity with Richardia africana agrees with the dormant or resting season of the yellow kinds.

The common arum comes from the moister regions of South Africa, and is therefore semi-aquatic by origin, whereas the yellow kinds come from warm inland districts, where the "hot season" is of periodic occurrence, and synchronises with the resting period of the plants. In this country their cultivation can only be successfully carried out under glass, and, in general practice, it is found of greatest convenience to rest them during the winter months, crowding their vegetative period into our spring and summer.

All the yellow arums are best potted up in spring, in a rich light compost similar to that used for the common arum; an intermediate house will meet their requirements till June, when they succeed under ordinary greenhouse conditions until such time as they pass out of flower, and the plants are induced to go to "rest" by gradually withdrawing the supply of water, eventually withholding it entirely.

Seeds of the yellow arums are sometimes obtainable, and flowering plants may be raised from them in three or four years. Dormant tubers are always offered by the trade at this season, and for a small sum flowering tubers can be had to begin with, and where an early display is required the latter are generally to be recommended.

The best yellow arums for garden purposes are as under: Richardia Elliottiana, a species originally raised from seed imported from South Africa. The spathes are of a golden-yellow colour, and the leaves are marked by irregular white blotches. The plant is vigorous in growth, and flowers freely during June and July from tubers started in February and March. R. Pentlandi is a stronger and finer species than the foregoing, and the leaves are deep green, while the stalks are more or less marked with purple blotches. The spathes are rich golden-yellow, with a maroon blotch at the base; it is a free and vigorous grower, requiring at least ten degrees more heat than the common arum to bring it to perfection. R. Mrs. Roosevelt is a hybrid between R. Elliottiana and R. albo-maculata: from the latter parent it derives a hardy constitution, and, therefore, succeeds under cooler conditions than the others. The flowers are pale sulphur-yellow, with a maroon blotch at the base of the spathe. R. Taylori is a hybrid between R. Elliottiana and R. aurata, in which the flowers are almost identical with those of R. Mrs. Roosevelt, if anything, rather deeper in tint.

R. albo-maculata is the hardiest, but scarcely merits notice as a decorative subject; the spathes, as a rule, have more green than yellow. Being fairly hardy, it is sometimes used to secure foliage contrast in the summer season.

Walmsgate Gardens.

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "Bulbs and their Cultivation," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

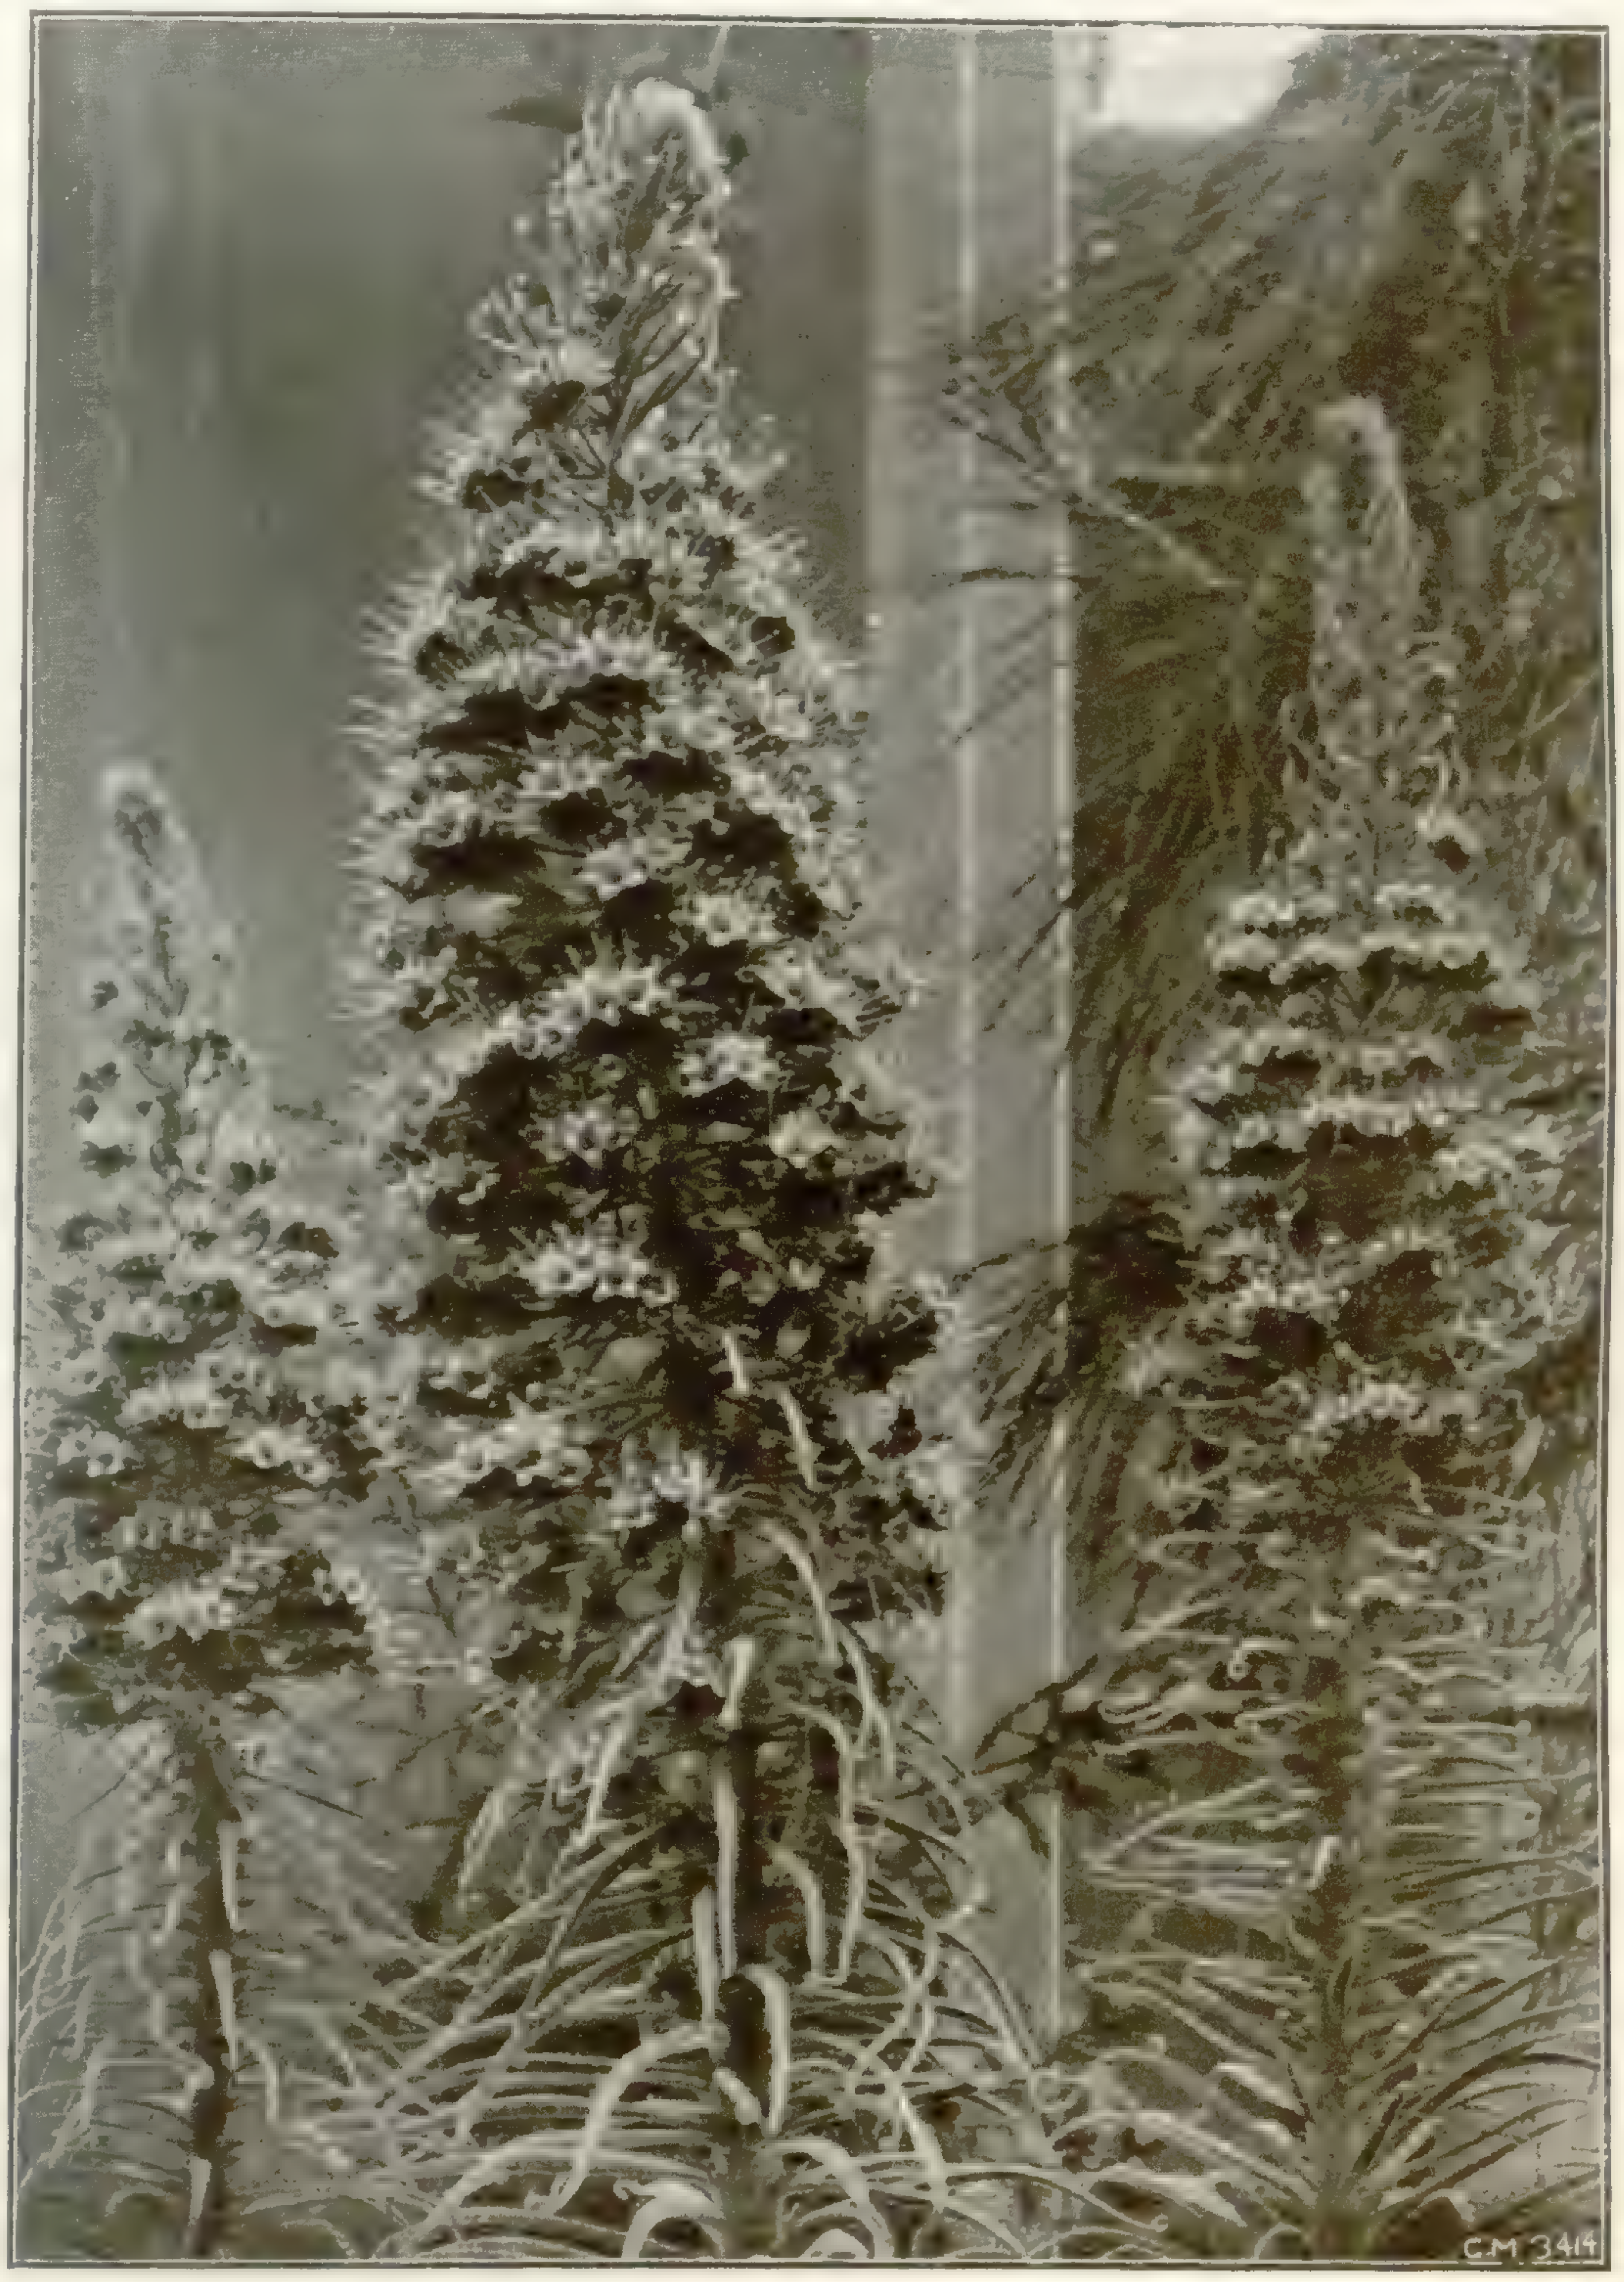
ECHIUM WILDPRETI.

The large number of species of echium known to science include several species of great beauty, and chief among them is the remarkably distinct and handsome Echium Wildpreti, of which an illustration is given herewith. In charm of colouring this species reminds one of the Viper's Bugloss (Echium vulgare), one of the finest of our native plants when grown under the conditions most favourable to the full development of both growth and inflorescence. In this, however, and indeed, in all other respects, the two plants are quite distinct. Wildpret's Bugloss is much larger in all its parts, and the flower spikes, as will be so readily seen, attain to a much greater height, and have a diameter exceeding those of other of the known species, native or otherwise. The flowers are relatively of large size, and the colour is an intense lustrous blue, and when so freely produced as in the case of the specimen herewith illustrated, are so effective as to at once attract attention.

This species is a native of the Canaries, and requires for its successful cultivation the shelter of glass and the temperature of the greenhouse, a light airy pit being the best place for the plants during the greater part of the period in which they are making their growth. As the species is a biennial, a stock is most readily raised by means of seeds, and to ensure plants of sufficient strength to produce finely-developed spikes, the seed should be sown rather early in the spring. As in the case of other biennials grown for flowering under glass, the seedlings should be pricked off into pans when large enough to admit of such operation being performed with safety, and put about an inch apart. When they have made sufficient growth for the leaves to touch they will require potting off singly, small sixties being the most suitable size to use. Subsequently, they must be shifted on as growth progresses until they reach six or seven-inch pots, in which they should remain until they have flowered. The pots must at all stages be efficiently drained, and a compost, consisting of mellow fibrous loam, to which liberal proportions of leaf-mould and coarse grit have been added will fully answer requirements. There is no occasion to be very exact, but to give the reader the fullest information it may be stated that one part each of leaf-mould and sand to four parts of loam are excellent proportions.

Echium Wildpreti blooms during the summer months, and the specimen herewith illustrated was flowering in the Temperate House at Kew at the time the photograph was taken.

B.



ECHIUM WILDPRETI.

A handsome species from the Canaries, bearing large spikes of intense lustrous blue flowers.

PRACTICAL FORESTRY.

Mr. John Michie, M.V.O., his Majesty's Factor on the Balmoral Castle Estates, delivered a lecture on Friday, 21st ult., on "Practical Forestry," before the members of the Aberdeen University Agricultural Discussion Society. There was a splendid attendance, and Mr. William Dawson, lecturer on forestry at the Aberdeen University, occupied the chair, and in a few felicitous sentences introduced the lecturer.

Mr. Michie, whose lecture was illustrated by a series of interesting slides, explained at the outset that his intention was to deal with that part of forestry generally known as sylviculture, or the growth of trees for the production of timber, as distinct from the arboricultural side -growth for the beauty of specimens or landscape effect. That certain other nations had been, and are, far ahead of us in the science and practice of sylviculture, he said, was now pretty well recognised in this country. Many years ago that fact was recognised by the Royal Scottish Arboricultural Society, but it was only in recent years that its members seemed to realise the value of the treatment of our timber trees on the lines carried to such excellent results in France and Germany. Of the more recently introduced kinds of timber, it was a question whether there were many suitable to the higher-lying Scottish glens and hillsides. Having tried pretty well all the introductions of the last hundred years, his conclusion was that the Douglas fir was the one worthy of most consideration, and, with respect to this tree, he was persuaded it would give a good account of itself when planted thickly on the ground, say, three to four feet apart, and afterwards treated carefully and sparingly in thinning.

Mr. Michie said he wished to take a retrospective view of his experience, and give his beliefs as to future management in the light acquired by successes and failures of the past. Proceeding to deal with the few species of trees which had hitherto composed the staple timber produce of our northern woodlands, Mr. Michie said they would all agree that he selected the right kinds in naming the European or Tyrolese larch, the Scotch pine, and the Norway spruce. Taking the last-mentioned first, the lecturer put on the screen a number of interesting views of sections of the great spruce forest in Thuringia, near Gotha, illustrating the outstanding characteristics of these trees, and the ideal form of their cultivation. Having described the methods adopted in planting spruce in the German forests, Mr. Michie pointed out that Norwegian spruce timber had been obtained in this country of as good quality as ever was produced in Germany or elsewhere, but more perhaps by chance than any pretence to good management, as most British foresters were wont to treat the spruce with neglect. Spruce had been planted indiscriminately as regards kind of soil, and even situation, which had given the tree a bad character in many ways. Almost any quality or kind of soil would give good results, provided retentive subsoils were avoided. The best sites were to be found on ground of a free, open nature, over sandstone or conglomerate rock.

Mr. Michie then proceeded to deal with the Scots pine. It was commonly termed Scots fir, but that was wrong. It was not a fir at all, and he would like to see it always given its proper name of Scots pine. Having remarked on the historical fact that large tracts of our Highlands, as well as many stretches of the low country, were in former times covered by the King of Scottish woods, Mr. Michie said there existed in more recent times at least three famed forests in Scotland, namely, Rothiemurchus, on Speyside; the Black Wood of Rannoch, in Perthshire; and Mar Forest, on Deeside. The best situations to plant, generally speaking, were those on which neither larch nor spruce would do well, in glens and on hillsides, where there was but little surface soil, with open gravel below, no matter how poor from an agricultural point of view. The chief mistakes made in its cultivation were too little care in planting, over thinning, growing as a mixed wood with other species (except where required for nursing other trees), failure in protection (mostly from rabbits in the younger stages, and from the destructive squirrel later on), and too early cutting, i.e., exploiting immature woods. Where natural reproduction was possible that should always be carried out, if even of a partial kind. He believed in encouraging a crop of birch, as after birch Scots pine invariably did well, more especially when both were natural to the ground.

Mr. Michie next dealt with the larch (Larix europea), particularly the variety indigenous to the Tyrolese Mountains, from which, it was believed, the seed came that produced the fine old Atholl and other woods of eighteenth century origin. Having dealt at some length with the susceptibility of the larch to disease, and the theories advanced in explanation of this fact, Mr. Michie pointed out that, unlike either spruce or pine, it should be grown fairly openly on the ground, but in homogeneous masses, or along with trees that grew much slower than itself, so that half its height might project above the general covering of the forest floor. Some of the best larches he had ever seen were associated with beech. Almost any soil would produce useful larchwood, except the two extremes of poor gravel, on which the Scots pine luxuriates, and stiff clay. Mr. Michie concluded by giving some useful hints on the best methods of planting. No doubt, he said, pitting was the best, but the expense entailed for regular forest planting had hitherto been considered prohibitive in this country. The next best method was to lift a spadeful of soil clean out, pulverise the bottom, insert the plant with the roots spread all round in as natural a way as possible, and pack in the soil round it.

Some of the slides illustrating the lecture were remarkably good, including views of characteristic trees and groups of trees in the forests of Ballochbuie, Birkhall, and Atholl. The lecture was greatly enjoyed, and at the close Mr. Michie, who was head forester at Balmoral previous to his present appointment, was accorded a vote of thanks.

MULCHING FRUIT TREES.

I believe in the mulching of fruit trees both in winter, spring, and summer time, but I think this matter is not studied as carefully as it should be by those inexperienced in the cultivation of fruit generally. A few persons put on a thick mulch in the autumn, and then allow the trees to fare as best they may, irrespective of what the seasons may be. I like to put on a warm mulch—one of littery manure—in the autumn, and then, as the warm weather comes in spring, to lessen the coating of manure considerably to allow the sun's heat to warm the soil. But as the heat becomes more powerful with summer's approach, I put on more mulching material judiciously, so as to prevent undue dryness of soil at and around the roots.

I am now referring mainly to the newly-planted trees, whose roots are near the surface and few in number. They must be kept warm, or at least safe from frost in the winter, and the soil should be kept cool and moist during the summer time; so treated I have found that the trees soon become established. Older trees, well established, with their roots permeating the soil some distance—not too far—from the surface, do not require any summer mulching, and are given winter dressings chiefly composed of chopped fibrous loam and rotted manure mixed. Where trees are planted near walls on sloping borders the summer mulching arrests the rain water and allows it to soak into the soil around the roots, especially when the surface crust is very lightly eased up with the garden fork.

Geo. Garner.

GARDEN FLOWERS AT ALL SEASONS.

(Concluded from page 84.)

April is pre-eminently the primrose month, and the use of the native kind as a companion for blue and rose, mauve or crimson hyacinths cannot be too strongly recommended. Wood anemones and bluebells, also their florists' varieties for the garden, are beautiful indeed; columbines are plentiful, the old-fashioned sorts being earliest, and polyanthuses offer many rich hues. Alpine phloxes and dianthuses always give pleasure because of their rose and red shades, blue and red pulmonarias are flowers well worthy of culture. Pansies should be at their best, the early blooms proving generally finest. All gardens should possess at least one tree of the maroon leaved, white blossoming Prunus Pissardi, and a selection of lilacs and laburnums.

May has a number of flowering shrubs, such as the American currant, Guelder rose, spiræas, gorse, weigelas, broom, and deutzias. It is the month also of the pæonies, trollius, pinks, Oriental poppies, lupins, German iris, Darwin and parrot tulips; late narcissi, dicentras, and pyrethrums.

The lilies and roses of June are sufficient alone to supply beauty, out of doors and within, but the Spanish and English irises, achilleas, ranunculuses, violas, and forms of Chrysanthemum maximum in all its varieties add to the splendour, which reaches a climax when the delphinium offers its innumerable shades of blue.

July is the month when galegas and summer phloxes, gaillardias, lychnises, and Coreopsis grandiflora and lanceolata are splendid. Carnations give fragrance as well as loveliness; day lilies, mimuluses, and foxgloves adorn shady places.

August brings in the golden harvest of the sunflower, aided by heleniums and heliopsis: the centaurea family is grand, too campanulas of many varieties, dwarf, medium-tall, and giants, erigerons, snapdragons, and torch lilies (kniphofias) may be seen growing rampantly together. Hollyhocks will also be highly attractive.

September owes a great deal to the golden rods, that make such an effective contrast with the lavender-blue of the Michaelmas daisy. Everlasting peas seem never out of blossom during this month; escallonias and tree fuchsias, with hydrangeas and cistuses, honeysuckles and clematises are larger beauties of the season.

October may surely be called the month of the pompon chrysanthemum; no garden can be dreary in which this hardy plant is well represented: gypsophilas and statices are excellent among them, with eryngiums, perennial asters, late phloxes, and pentstemons.

As for November, if a sufficient quantity of Schizostylis coccinea is grown it will be a noted time for garden brilliance; of course, there will be a great variety of Michaelmas daisies still in flower, also Japanese anemones, sunflowers, and the stately white Pyrethrum uliginosum.

December may possess plenty of chrysanthemums if the locality is a genial one, and plants of late-blooming varieties are grown against a south wall, trained to sticks, so that every flowering shoot is well spread out from its neighbour, and sheltered by a linen awning overhead. This awning is easy to arrange, for it can be merely nailed along the wall at the back of the long strip, and the front edge can be tied, at two-yard intervals, to bamboo poles ranged along the border. During sunny days the ties should be undone, and the awning should be allowed to hang down, flush with the wall, behind the chrysanthemums. With a contrivance of this kind it is possible to flower most of the December-blooming varieties out of doors, and the October and November sorts are to be had also in blossom by cultivating them in similar style on a west border. William Holmes, crimson; Julia Lagravère, velvet-red; Lizzie Adcock, gold, are excellent sorts. In front of the south wall chrysanthemums may be a carpet of Iris Vartani, a lovely little six-inch plant with sky-blue flowers.

M. H.

CUCUMBERS FOR EXHIBITION.

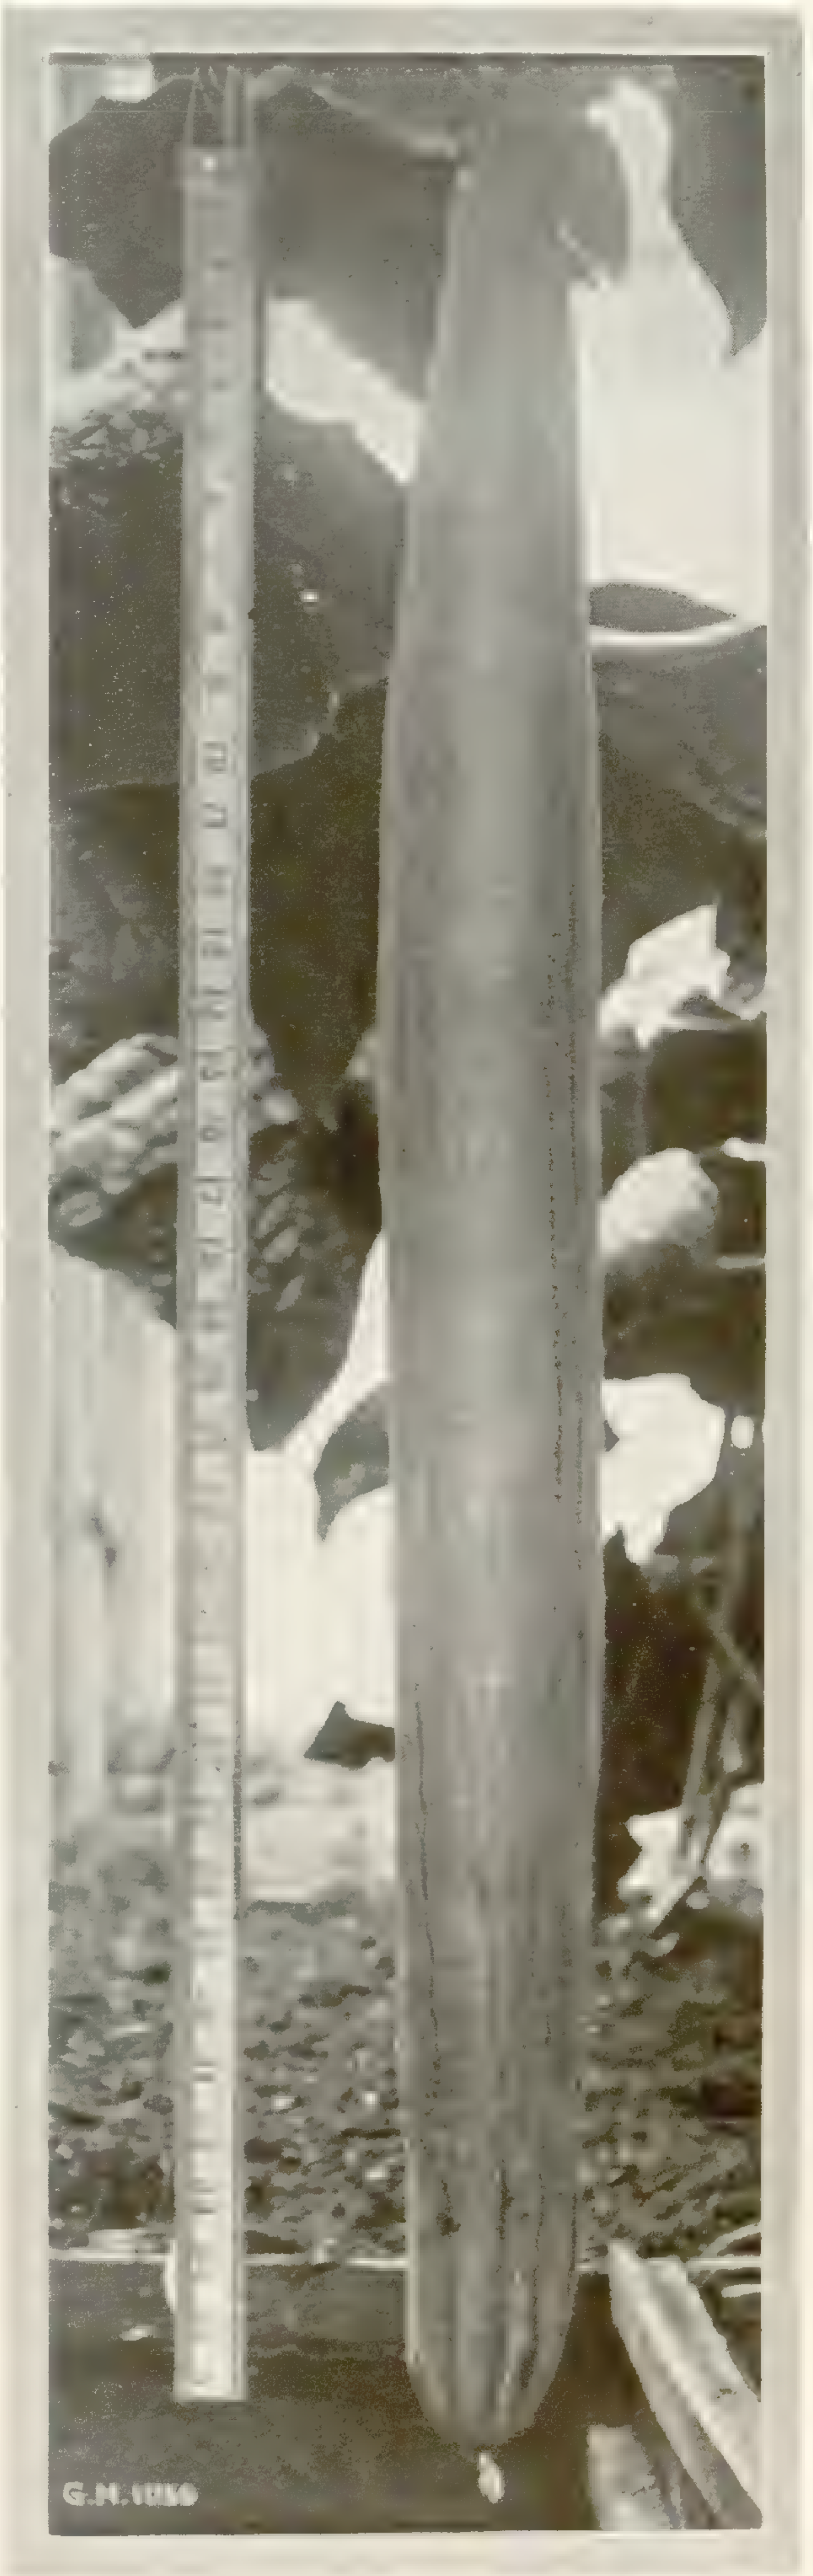
To grow and obtain extra fine cucumbers we must proceed on somewhat different lines to those followed in the production of supplies for ordinary purposes. Select some good sterling variety, which experience has proved you can rely upon. Sow the seeds singly in large 60-sized pots, using fairly moist light soil. Plunge the pots in a brisk hotbed, a bottom heat of 75 degrees being the most suitable. Do not give the soil water until the seeds have germinated, and the plants are commencing their growth.

The soil should have been prepared some little time previously. The following I have found to be an ideal compost. The quantity to be prepared according to the size of the beds, but the proportions should be: Turfy loam six parts, cut up into lumps the size of an egg, the small to be thrown aside; fresh horse manure, two parts; old plaster rubble, wood ashes, and bonemeal, rather coarse, one part each. To this should be added one quarter of a part of soot, and a six-inch potful of Clay's Fertiliser, and the whole thoroughly mixed. Make up the mounds, and when the soil has become thoroughly warmed through, which may take some ten days, and the plants are well rooted, but by no means potbound, select the strongest plants, and place them three feet from each other, planting on mounds, slightly raised, the depth of soil not to be more than six or seven inches. As they root through, which they will do every week, they will require a topdressing to encourage surface roots.

The best topdressing to use is the old material from a mushroom bed, from which the very fine has been removed by a sieve with half-inch mesh. Add a six-inch potful of fertiliser to a bushel and a-half of the mushroom manure. The plants must not be allowed to fruit until they have made from five to six feet of growth. The side shoots should be stopped at the third joint, and the male blooms removed until you decide which fruit you will select to swell off.

When the flower of the fruit selected is fully open, about midday pollinate the flower. Select the male flower from a plant other than one on which the fruit is growing. As a guide to the dates for sowing, to obtain fruits for the exhibitions at which it is intended to compete, it may be mentioned that the time from the sowing until fully developed fruits may be expected to be fit will be from eleven to thirteen weeks. For competition good specimens, when finished, should be of medium size, fresh, young, straight, even throughout, well matched in size, short in handle, good in colour, covered with bloom, with the flower retained at the tip, which adds much to their appearance.

I may add that the specimen herewith illustrated was grown for size, and not for competition, and under the conditions here briefly explained. The variety was Daniels' Duke of Edinburgh. The seed was sown April 5, the plants put out May 1, the flower pollinated June 9, the first fruit cut on June 29, exhibited at Richmond, June 30, and awarded a Certificate of Merit. The length was three feet, the weight 9lb. 8oz., the girth 11½ inches, and it was perfect in shape and colour.



[Photo: W. Jukes, Wilton.

A WELL-GROWN FRUIT OF CUCUMBER DUKE OF EDINBURGH.

Length, 36 inches; girth, 11½ inches; weight, 9lb. 8oz.

On another plant, a week later, I cut the second fruit, which was 35 inches long, weighed 9lb. 10 oz., and had a girth of 11¾ inches. Other kinds I can speak well of for exhibition are Sutton's Peerless, Veitch's Sensation, Carter's Model, and Kelway's Conqueror.

Gardener to G. R. Kendle, Esq.
Wilton, near Salisbury.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

CATTLEYAS.—Many of the species and hybrids of Cattleya and allied genera that have been flowering during the closing months of the last year will be in an active rooting state, and any plants that require repotting or top-dressing may now be attended to. In cases where root action has not yet commenced the plants should be examined, and where there is a number of back pseudo-bulbs the rhizome should be severed two or three bulbs behind the leading growth. There is little advantage in keeping plants in large pots, unless there are sufficient leading growths to make a corresponding display of bloom; and as the majority of this class of orchids go on for a number of years without giving more than one leading growth annually, there is every advantage to be derived from severing the rhizome, and thus forcing the plants to break from the dormant eyes.

BACK BULBS.—There can be no question but that the back bulbs, especially the leafless ones, in practically all orchids are a detriment rather than assistance to the plant. Their roots have in most cases perished, and they are without foliage, so their only means of life is to draw from the active portions of the plants, and it will be frequently observed that where the latter are relieved of the strain of back bulbs by the severance of the rhizome, that a very apparent advance is made the following seasons.

CATTLEYA WARNERI, and some others of the summer flowering kinds, will now be producing their new growths. The plants in this condition should be placed in a warm portion of the house, and in a position where they may obtain the maximum amount of bright light. Water carefully in the early stages of growth, and avoid extreme fluctuations of temperature. C. Trianiæ and other spring-flowering kinds are now advancing their flowers through the sheathes. These must be carefully watched, as excess of moisture in the atmosphere, with rapidly falling temperatures, causes an accumulation of moisture inside the sheath, which, if allowed to remain, causes the flower buds to rot. If a small portion of the point of the flower sheath is cut away and opened with the point of a knife, it allows the moisture to evaporate and saves the flowers. Some varieties of C. Mossiæ annually lose the chlorophyll in the sheathes, and these turn yellow about this time of the year. It is desirable that the points of the sheathes be cut, but on no account should they be torn out, as they protect the advancing flower buds in the early stages of development. All plants that have their flower buds in an advanced state should be placed in a position where they may obtain full advantage from the available light. This will considerably assist the colour pigment, and add to the substance of the flowers after they expand. A gentle spray overhead will benefit the cattleyas whenever the outside conditions permit of its being done.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

SCHIZANTHUSES.—Plants in small pots will need a shift into 6in. or 7in. pots, using loamy soil with leaf-mould and sharp sand added. Keep them in a cool house on a shelf, and give plenty of air. The more advanced batch will benefit from artificial manure given once a week. When in flower early schizanthuses give a pleasing appearance to the greenhouse, and are very useful for cutting and for decorating. Make another sowing for succession.

SWEET PEAS intended for flowering early should be attended to at once, using small birch twigs to keep them upright. Do not leave too many plants in one pot, from six to seven in a 9in. pot will be quite sufficient.

Those in 5in. pots should have a shift into 9in. pots, using good drainage, some rough material over the crocks, and then a layer of decayed manure. Care should be taken not to disturb the ball of roots, as this checks growth. When the pots are well filled with roots feeds them with some good artificial manure once a week at first, and twice a week afterwards, giving air freely as the weather improves.

CYCLAMEN.—The earliest cyclamen that are past flowering should not be thrown away, but kept in a resting condition in a cold frame. If large plants are desired the most successful method of cultivation is to plant these out in a cold frame at the end of March or beginning of April. The frame should be filled up with a compost of good loam, leaf soil, manure from an old mushroom bed, wood ashes, and sand, mixing these well together. The old soil should be carefully removed from the roots before planting, and care should be taken to work the fresh soil in about the roots, and make it fairly firm round each plant. Keep the crowns above the surface of the soil. Give one thorough soaking of water, and this will suffice till growth commences. The plants should be syringed about two o'clock in the afternoon, shutting up the frame at the same time. Shade from early morning until damping down in the afternoon.

GLOXINIAS.—As soon as the tubers show signs of growth they should be shaken clean out of the old soil, and be repotted in a mixture of loam, leaf soil, peat, and sand. Provide good drainage, otherwise there is a risk of the soil becoming sour, as gloxinias require much water while in active growth. Syringe overhead until leaf and root growth becomes active.

BEGONIAS.—These should be examined, and a batch of tubers be brought in for an early start. In a greenhouse they should be grown in batches of one colour: from fifteen to twenty plants for one group.

SHOW PELARGONIUMS.—Those cut back last autumn will now be ready for repotting. The compost for potting should be good loam, leaf-soil, sand, and a little old lime rubble, with a 6in. potful of artificial manure to the barrow-load of soil. Pot rather firmly, and keep near the glass in a cool house. Cuttings that were put in last autumn will now be ready for potting off singly, using the same potting material, but of a finer grade.

CHRYSANTHEMUMS.—A batch of cuttings should be put in as soon as possible, and handlights may be used for them. The light may be lifted off in the forenoon, and moisture removed from the glass with a sponge, replacing the light again soon, for the cuttings must be kept close for four or five weeks; 2½in. pots are suitable for the cuttings, three in a pot, as when rooted, especially if they are the bush varieties, they can be potted on without disturbing the roots into 5in. pots, which saves time and labour.

VIOLETS IN POTS.—Those that have been standing in a cool house should be put into a warmer structure, giving them a place where they will get the full benefit of the sun. A sprinkling of artificial manure over the surface of the soil, and well watered in, will help the plants. But on no account force the plants.—W. Staward, Belford Hall Gardens.

THE FLOWER GARDEN.

HERBACEOUS PLANTS may now be planted should the weather be mild, or old borders may be remodelled, reducing in size the stools or crowns of the more luxuriant varieties. The plants should be so disposed as to produce the most pleasing effect when in flower, and an uninterrupted succession of bloom throughout the season. On light soils, and during mild weather, border carnations might be planted, also the various kinds of garden pinks that may have been raised from cuttings or seeds. On heavy, cold soils it is safer to delay these operations for a time, and especially so where the borders are saturated with excessive moisture occasioned by the heavy downfall of the present season.

PROPAGATION.—Such half-hardy annuals as require to be sown under glass to forward them for the open borders, may now be sown, and as soon as the seeds have germinated, air should be freely admitted upon all favourable occasions, while during warm days the lights (if raised in frames) might be removed altogether. Thin out or transplant as required, and afford the seedlings every facility for producing a sturdy growth. The propagation of all kinds of bedding plants may now be put forward with all possible speed, for with the lengthening days and increasing sun-heat, the stock plants should now be making growths suitable for cuttings.

SHRUBS.—The planting of deciduous shrubs and trees in light soils should be completed forthwith, and the pruning of these be finished as soon as possible. In very old or exhausted shubberies it may be necessary, after forking up the surface of the ground, to afford a dressing of thoroughly decayed manure or leaf-soil, as either of these will help to encourage new growth, especially where the shrubs have become stunted by repeated pruning, and a freer growth is considered desirable. The borders adjoining the shrubberies should now be cleared of all weeds or leaves, and the ground dug or trenched as may be required for the welfare of the occupants during the forthcoming season.

HERBACEOUS PHLOXES deservedly rank high among our most desirable and effective subjects for affording a brilliant display of colour, and a succession of flowers for cutting during the late summer and autumn months. When making new borders for these, deep trenching, and a liberal supply of manure is absolutely necessary, especially in porous or hungry soils; and in most instances a liberal top-dressing of a similar nature is an additional help to these somewhat gross feeders. To plant these subjects in a starved-out border means certain failure, as may sometimes be seen where plants have been allowed to remain undisturbed or unfed for a number of years. On the other hand, no subject of the flower garden will more readily respond to liberal treatment if given in the manner indicated. Both the early and late-flowering varieties are easily increased by division of the roots, or by cuttings inserted in sandy soil during spring or summer. By the latter method very fine spikes of bloom may be produced during the following season.—W. Hedley Warren, Aston-Clinton Gardens.

HARDY FRUITS.

PREPARATION FOR GRAFTING.—In many gardens certain varieties of apples and pears that have been planted for some years do not succeed, which no doubt is owing to the locality, and, in many cases, the unsuitable soil for those particular varieties. In a week or two trees of this description should be headed back with a saw, and the cut parts smoothly knifed or chiselled off; the branches of the trees should be cut so as to form a skeleton, ready to be grafted with a suitable variety at a later date. Pay particular attention to the stocks, and see they are free from canker, as it is absolutely useless to graft trees badly infested with this disease. Scions that were cut off some time previously should be examined, with a view to keeping the buds as dormant as possible.

HARDY VINES.—The pruning of hardy vines, either those grown on walls or in the open quarters, should be finished at once. The lateral growth of vines growing on walls should be cut back to within two buds of the stem, and any leading growths that are required for extension should be shortened back to about two or three feet. The same method is adopted when pruning vines in the open quarters, such as we have in the vineyards here—which consist of about 40,000 fruiting vines— only, in this case, no extension is necessary, and all the canes are cut down to within two buds of the base; after pruning is finished the vines should be painted with a mixture of flowers of sulphur, lime, and soot in equal quantities. We find this one of the best preventives against mildew and red spider, together with dusting the vines over two or three times with flowers of sulphur during the growing season. If any cuttings are required for propagation select well-ripened canes. These should be cut into lengths,leaving four buds; remove the two lower ones with a sharp knife, and the cuttings should be planted at once, in rows six inches apart, and three inches apart in the rows. Choose a piece of well-trenched ground, where no manure has been added, and plant the cuttings firmly, keeping the two buds on the upper portion well above the level of the surface soil; here they should be allowed to remain in the nursery bed for twelve months before being transplanted.

STRAWBERRIES. — Where strawberry plantations have not been cleaned, and the ground between the plants has not been forked over, this work should be done at once · in the absence of frost, and a good dressing of long stable litter should be given around the plants. Where new plantations were not made early last autumn—which is undoubtedly the best time—everything should be done to push forward the preparation of the ground to facilitate planting a few weeks hence. Young plants that have been held over for this purpose, if in pots, should have all dead foliage removed, and not allowed to become dry at the roots at any time.—Henry R. Farmer, Cardiff Castle Gardens.

HEMEROCALLIS FLAVA.

The day lilies, or hemerocallises, are excellent border flowers, and hybridisers, such as Mr. George Yeld and others, have been doing good work in increasing the varieties we have at our command for the garden. Some of these are acquisitions, but it is hardly likely that they will entirely oust H. flava, the golden day lily, from our gardens. It is a beautiful species, of most charming character, and its ease of culture will render it a favourite with many who like flowers of beauty which are easy to grow. It will grow about three feet high in good soil, but it is one of the good points of this day lily that it will thrive even in places where the earth is of a poor character, although somewhat dwarfed under such circumstances.

There are many positions in the garden where H. flava will be appreciated, either in the border or in the wild garden. Grouped with other flowers, its clear yellow flowers in summer are enjoyed, and the foliage is in itself by no means one of the least attractive features of this good old plant. It is handsome and pretty in hue. The flowers, which individually have but a short life, are so numerous that a long succession is produced, the fugaciousness of the blooms giving rise to the name of hemerocallis, which means beautiful for a day. In dull weather I have known the flowers last longer, but the succession of bloom retrieves the loss caused by the brief duration of each flower.

Hemerocallis flava is thoroughly hardy, and can be multiplied by division of the roots in spring or autumn, the proper period depending largely upon the soil and the climate. In cold districts spring division is perhaps the better method, but if the process is performed in early autumn little chance of failure will follow. Each crown with a root attached will grow, and thus a good stock of plants for forming a large group can soon be secured.

S. Arnott.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

French Horticultural Society of London.

There was a very large muster of members and friends on Saturday evening last at the Café Royal, Regent Street, to celebrate the twenty-first anniversary of the inauguration of the Société Francais d'Horticulture de Londres. M. Philippe de Vilmorin, who was to have presided, was prevented from coming to England for that purpose by the further rising of the floods in Paris, this having necessitated the sudden removal of his wife and family to a safe distance from the flooded area.

In the absence of M. Vilmorin, the chair was taken by the French Consul-General, M. Laurent Lalande, who made a capital president. The toasts of "The President of the French Republic" and of "His Majesty the King" were cordially honoured immediately following the excellent dinner. Among those present on this occasion we noticed Sir Albert Rollit, Messrs. H. J. Veitch, A. W. Sutton, G. Schneider, H. B. May, F. May, P. Veitch, jun., C. Harman Payne, T. Bevan, D. Ingamells, W. Nutting, Murison, Beale, E. F. Hawes, Eihle, Aquatias, Guilloud, J. Clarke, Curtis, Dymock, G. Day, etc., etc.

Sir Albert Rollit referred very sympathetically to the great disaster that had befallen France in the floods that were devastating so great a part of the beautiful city of Paris, and regretted that this disaster was the cause of the absence of M. Vilmorin that evening. Sir Albert dwelt at some length upon the present kindly feelings existing between France and England, and expressed the hope that these would continue and be strengthened. He was glad to be with them again, and, with others present, show his appreciation of the services rendered to international horticulture by the Société Francaise d'Horticulture de Londres, and especially by their friend M. Schneider, the founder of the society. Sir Albert suggested that, as horticulture had played so prominent a part in bringing the two nations together, it would be a gracious act if some amount could be collected at the meeting and forwarded for the sufferers from the floods in Paris.

The Chairman, in proposing the toast of the evening, spoke very feelingly of the absence of M. Vilmorin, and of the trouble caused by the floods in Paris; he dwelt upon the great power of horticulture in binding people and nations together, of the refining influence of flowers, and the great business now conducted in the culture of flowers, fruits, vegetables, and seeds. He spoke of the great value of the society to young men who came to England from the Continent, and the kindly way in which these were received by the English horticulturists. Mr. Schneider responded, pointing out that the society commenced in a small way at Chelsea, and had now grown to full estate, and was doing excellent work. It had been proposed that to celebrate their coming of age the society should contribute £30 to the Gardeners' Royal Benevolent Institution, and £20 to the Royal Gardeners' Orphan Fund, but in view of the great distress in Paris, and after consulting Mr. Harry J. Veitch and Mr H. B. May, who represented these useful British horticultural charities, it was unanimously agreed that for the moment the distress in Paris provided the most pressing need, and so the £50 would be sent to the Lord Mayor to forward to the proper authorities.

To the toast of "British Horticulture" Mr. Harry J. Veitch very ably responded. Mr. H. B. May proposed "Le Bureau de la Société Francaise," and eulogised the work of Mr. Schneider. M. Guilloud suitably responded, and also proposed "Past Chairmen," referring to those who in the past had lent their help and prestige to the society. Mr. C. Harman Payne responded in a humorous speech, in capital French, and then, in English, he proposed "The Horticultural Press," stating at the same time how freely the pages of the Press had been opened to any efforts made to extend the usefulness of the society and make it better known. Mr. Charles H. Curtis, of the Gardeners' Magazine, in responding, referred to his association with many members of the society, who now occupied high positions in the world of horticulture, and who did so largely because of the help afforded them by the society. Mr. Thos. Bevan gave "The Chairman," which was heartily accorded, and gracefully responded to.

During the evening letters and telegrams were received from M. Philippe de Vilmorin, M. Gentil, and others, regretting their inability to be present, and sending good wishes. The total sum raised for the sufferers in Paris was £100 1s. 6d.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, January 25.

Present: Mr. E. A. Bowles, M.A., F.E.S., F.L.S. (in the chair); Dr. A. B. Rendle, Messrs. A. D. Michael, H. J. Chapman, J. W. Odell, J. T. Bennett-Poë, J. Douglas, W. Hales, A. Worsley, W. E. Ledger, A. W. Sutton, and F. J. Chittenden (hon. secretary).

ISOLOMA ERIANTHUM—Mr. J. W. Odell showed a specimen of an isoloma, probably I. erianthum, figured in "Bot. Mag." 7,907, but the flowers were of a deeper red than in the figure.

CYCLAMEN PERSICUM.—Messrs. Barr, of King Street, Covent Garden, showed plants of Cyclamen persicum grown from corms collected near Smyrna, in Asia Minor. The amount and distribution of the white markings on the foliage showed a considerable degree of variation, and there was also some amount of variation in the extent of the pink suffusion on the white ground of the flowers, which were much smaller than those of the cultivated plant, and were possessed of a very sweet scent, too often lacking in those at present cultivated. Mr. Sutton remarked that the plant was exceedingly common in Palestine, but the corms were usually too large to remove.

DYING BULBS.—Some narcissus bulbs were received without roots and in various stages of decay. It was thought that there was something wrong in the system of cultivation, particularly as the soil was very wet.

Birmingham Gardeners' Association.

The spring session of this society was inaugurated on January 24, under the chairmanship of Mr. T. Humphreys, when a capital attendance of the members were entertained by a lecture illustrated by lantern-slide sketches, entitled "Competition for a living in the plant world," given by Mr. T. H. Russell, F.L.S. The sketches or drawings were executed by the lecturer himself, in a most artistic manner; whilst the verbal descriptions of tall-growing trees, climbing and other plants, with their various modes of attachment were of special interest. Mr. Russell also described the leaf arrangements and the positions and contrivances of flowers brought about for the purpose of protecting their fertilising organisms, etc. In adverting to the more salient points of the lecture, the Chairman recommended the attention especially of the younger gardeners to the advantage of a study of the subjects that had been dealt with that evening. A brief but animated discussion followed, and, in acknowledging a hearty vote of thanks, Mr. Russell expressed the great pleasure it afforded him to appear before such an attentive audience of the profession, likewise having himself learnt interesting information from those taking part in the discussions. Two or three new members were added to the association.

Liverpool Horticultural Association.

The annual meeting of this society was held on the 29th ult. at Hackin's Hey. Mr. T. Foster presiding. The report gave evidence of a good year's work having been accomplished, the initial rose and sweet pea show proving most satisfactory, although the date selected for roses was unfavourable to a fine display. The residents in and around the city showed their interest by coming in large numbers. The autumn show upheld the high traditions of Liverpool, the chrysanthemums being of high merit. For the summer show the Corn Exchange was considered so suitable that the committee have decided to hold the three shows — spring, summer, and autumn—in the same building. The statement of accounts show a gain on the year's working of £50, leaving a credit balance at the end of the year of £220 8s. 6d. Sir W. H. Tate, Bart., the winner of the silver challenge vase for forty-eight chrysanthemums, has presented the society with a handsome trophy, to replace that which he has been successful in winning. A cordial vote of thanks was tendered to Mr. Foster for his valuable services for many years as chairman, regret being expressed on his retirement from that important position. Mr. Harold Sadler, 31, North John Street, Liverpool; and Mr. G. Blackmore, Stevenson Street, Wavertree, were re-elected respectively as secretary and sub-treasurer. Messrs. Harmood, Banner, and Son, and R. G. Waterman were again elected as auditors. The spring show is fixed for April 6 and 7.

Bristol Gardeners' Association.

A meeting of this society was held on January 27 at St. John's Parish Rooms, presided over by Mr. S. Shaddick. Mr. Milburn, representative of the Bath Gardeners' Association, gave a comprehensive paper upon "Hardy Trees and Shrubs," the lecturer confined his remarks to those kinds that grow perfectly well in the neighbourhood, and gave a description of their chief characteristics, also stating the most suitable position and best kind of soil for their successful culture. The following shrubs Mr. Millburn mentioned as doing well in this locality: berberis, buddleias, ceanothuses, choisyas, carpenterias, cistuses, daphnes, escallonias, genistas, olearias, veronicas, abelias, clethras, diervillas, cerasus, lilacs, laburnums, magnolias, spiræas, and viburnums, naming several varieties of each.

For the prizes for two table plants there was a strong competition, the prizes going to Mr. Bastin, 1st; Mr. Shelton, 2nd. Mr. Gostling staged a good collection of cypripediums as cut blooms, including Mons. de Curte, Maudiæ, Charlesworthianum, Nitens St. Alban var., Swinburnei, Mastersianum, and seedlings raised at Horfield Lodge, these were awarded three points.

Reading Gardeners' Association.

The first fortnightly meeting proper of the New Year took place in the Abbey Hall on Monday, January 24, when the recently elected chairman for 1910, Mr. T. Judd, presided over a good attendance of members.

Mr. T. Neve, of the Gardens, Sindlesham House, was the lecturer for the evening, and his subject "The Best Course to Adopt with an Old Neglected Orchard." Mr. Neve is one of the fathers of the association, and the benefit of his wide experience is always at the disposal of the members. On the present occasion he was very much at home with his subject, and after informing his audience that some of the trees under his care must be getting on for a hundred years old, produced some rods he had that day cut from one of these ancient trees, that would have done credit to a youngster of a few years standing. Mr. Neve gave the fullest information with regard to the methods he adopts in the rejuvenation of his trees, heading back, pruning, spurring, root pruning, etc., being all dealt with in a thorough manner.

At the conclusion of Mr. Neve's remarks a lengthy and most instructive debate took place, and the lecturer readily answered the many inquiries addressed to him.

A hearty vote of thanks to Mr. Neve concluded the evening.

The annual tea and entertainment for members and their friends has been fixed for Wednesday, February 16.

Aberdeen Chrysanthemum Society.

There was a splendid attendance at the annual meeting of the members of this society, which was held in the Y.M.C.A.'s Buildings, Aberdeen, on Saturday evening, 22nd inst. Mr. Andrew Davidson, C.A., chairman of directors, occupied the chair. In moving the adoption of the annual report and accounts, the Chairman said it was owing to no fault of the executive that they had this year to record a deficit in the society's income. The cause of the shortage was the falling off in the takings at the society's show held in November last. He trusted larger crowds might turn out at their next show, and their financial stability be thereby strengthened.

Lord Provost Wilson, of Aberdeen, was elected hon. president of the society, and the hon. vice-presidents were all re-elected, with the addition of Mr. Crombie, of Balgownie Lodge, and Mr. Andrew Davidson, C.A. On the motion of the Chairman, Mr. W. J. Middleton, J.P., Aberdeen, was unanimously elected chairman of the society for the ensuing year, and Mr. A. M. Cocker (Messrs. James Cocker and Sons, rose growers, Aberdeen), vice-chairman. A large and very representative committee was then appointed, and, on the motion of the new chairman, Mr. M. H. Sinclair, F.R.H.S., was unanimously and most cordially re-elected secretary and treasurer of the society. After deliberation it was decided that the annual show of the society be held in the Music Hall Buildings, Aberdeen, on November 25 and 26, 1910. This was all the business, and the usual votes of thanks terminated a very pleasant meeting.

OBITUARY.

◆

PROFESSOR W. HILLHOUSE, M.A.

We regret to record the death of Professor W. Hillhouse, which occurred at his residence at Malvern on the 27th ult., in his fifty-fifth year. Professor Hillhouse, who was a native of Bedford, and a schoolmaster for some time in that town, devoted, at a comparatively early period of his life, much attention to the study of natural history. He was the founder of the Bedfordshire Natural History Society, and took an active part in the preparation of "The Flora of Bedfordshire," for which he was elected a Fellow of the Linnean Society. In 1877 he resigned his appointment at Bedford, and went to Trinity College, Cambridge, where he specially distinguished himself. He was appointed assistant curator of the University Herbarium, and subsequently he was appointed lecturer on botany at Trinity, Newnham, and Girton. In 1882 he was appointed the first Professor of Botany at the Birmingham University, a position he held until about three months since, when he retired in consequence of his indifferent health. During his residence at Birmingham Professor Hillhouse took an active part in social and educational movements, and was a great worker for the Botanical Gardens at Edgbaston.

FERTILISATION OF WAVED SWEET PEAS.

At the Sweet Pea Conference held at the Hotel Windsor, Victoria Street, Westminster, in December last, following the annual meeting of the National Sweet Pea Society, Mr. Wm. Cuthbertson read a paper, entitled "The Imperfect Seeding of Waved Sweet Peas," a résumé of which has appeared in our columns. In the course of his remarks, Mr. Cuthbertson said: "Some people argue that sweet peas are pollinated by wind-borne or insect-borne pollen, and that accounts for the variations we get in so many stocks of Spencer sweet peas. I have never been able to subscribe to this theory, because I think I have had as large an experience as most, and have not observed it happen in practice. The plan we adopt at Mark's Tey is to grow the different varieties in lines 100 feet long. There may be four lines of The Marquis, followed closely by four lines of Countess Spencer, then four lines of Helen Lewis, and so on. If the wind or insect theory of cross-fertilisation held good we should not get pure seed, but as a matter of fact we do. Then again, it is suggested that in America there must be insects, unknown in this country, at work there to give us the fine variations we so frequently get! I should like to have Mr. Burpee's or Mr. Morse's opinion on this point."

An answer has been given both by Mr. W. Atlee Burpee, of Philadelphia, and Mr. Lester L. Morse, of San Francisco, and their comments we cull as follows, from the pages of our excellent American contemporary, "The Florist's Review":

Mr. W. Atlee Burpee wrote: "Replying to Mr. Cuthbertson's inquiry, would say that, in common with most growers and observers of Spencer sweet peas, I hold firmly to the opinion that the great majority of new varieties of this type are entirely what might be called accidental sports. No special climatic conditions or 'insect theory' seems to apply to California more than to England. It is noteworthy that sports of similar character and in several cases identically the same have been found in both countries.

"While most of the varieties so far introduced have been accidental sports, it is only fair to say that now there are quite a number of new seedlings, the result of cross-fertilisation, both in California and England.

"Most of the work on the Spencer sweet peas from now on, however, by the growers should be in the way of producing true stocks, which can never be done at anything approaching the cost of growing the grandiflora type."

Mr. Lester Morse wrote: "I was much interested in the synopsis of Mr. Cuthbertson's paper on 'The Seeding of Waved Sweet Peas,' as published in the 'Review' of December 30.

"I agree with Mr. Cuthbertson in his opinion that sweet peas rarely, if ever, cross accidentally. In making artificial crosses it is necessary to take the bud at an early stage of its growth almost as soon as it shows its colour. You will find almost without exception that an advanced bud has already fertilised itself.

"I have never seen honey bees working on sweet peas, but have seen bumble bees doing so more or less, and these always operate on a fully expanded flower, standing with a foot on each wing, so as to drink from the base of the pistil. While they may carry away some pollen on their legs, I do not believe it possible to cross with another full blown blossom.

"Just what is causing the phenomenal 'breaking' in Spencers I do not know, and I am not yet ready to venture a theory.

"Occasionally, in the past, we have had selections of grandifloras which we never could 'fix,' even after five years of constant work. We had a selection of our own, similar to Eckford's Mrs. Knight-Smith, which was one of these. As soon as we saw Eckford's variety we anticipated the result as we all found it, and we all had to discard Mrs. Knight-Smith.

"I believe we shall be able to fix most of the Spencers by simple but continuous selection. Countess Spencer itself now comes true, and so do several others. The tendency is to revert to the hooded or grandiflora type, rather than to other colours, after the fixing is accomplished.

"The failure of the blossoms to set seed is still a great mystery. The blossoms seem always to come to perfection and then drop off, just as they should fade and droop to make way for the pod. I have not been able, so far, to find the cause for this, and am inclined to think it is the nature of the type. This characteristic certainly means a long blooming period and for the planter it means the very thing he wants."

NEW BOOKS.

◆

SWEET PEAS AND THEIR CULTIVATION.

By Charles H. Curtis, F.R.H.S. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.) Third Edition. Price 1s. net, by post 1s. 2d.; cloth 1s. 6d., by post 1s. 8d.

Just now every lover of sweet peas is busy preparing for the season just opening. If he has purchased his seeds he will soon be sowing them, and if he has not purchased he will be considering what varieties to obtain. To help all those interested in the culture of the fragrant and beautiful sweet pea there comes most opportunely the third edition of this handy, interesting and eminently practical work from the pen of the hon. secretary of the National Sweet Pea Society. A new edition each year, and one or two reprints of each edition are ample evidence of the need for such a book, and the great value of the advice given. This third edition retells the story of the introduction of the sweet pea into England, and its improvement at the hands of Eckford and other florists, the "evolution" being brought right up-to-date. The work of raising new varieties is ably dealt with, and the practical advice given in respect of cultivation from seeds or cuttings is such that excellent results cannot fail to follow if it is practised. The exhibitor will gather much useful information from this book, while the novice will profit by the revised selections of varieties given, and the capital lists of too-much-alike varieties. Soil preparation, manuring, feeding, staking, and tying are all dealt with in a capable manner. Almost all the illustrations in this edition are new ones, and, as they add to its interest and appearance we feel sure the continued popularity of the book is assured.

FORTHCOMING ENGAGEMENTS.

SATURDAY, February 5.—French Horticultural Society of London.

MONDAY, February 7.—National Chrysanthemum Society, Annual Meeting Carr's Restaurant, Strand, London, 6.30 p.m.

TUESDAY, February 8.—Royal Horticultural Society; Committees meet at 12 o'clock; Annual Meeting at 3 o'clock; Scientific Committee at 4 o'clock.

FRIDAY, February 11.—Royal Gardeners' Orphan Fund. Annual Meeting and Election at Simpson's, 101, Strand, at 3 o'clock.

SATURDAY, February 12.—Chester Paxton Society, Lecture on "Sweet Peas," 8 p.m.

TUESDAY, February 22.—Royal Horticultural Society; Fruit, Floral, and Orchid Committees, 12 o'clock; General Meeting and Lecture, 3 p.m.; Scientific Committee, 4 p.m.

SATURDAY, February 26.—Chester Paxton Society, Lecture, "Insects as Carriers of Disease," 8 p.m.

Index to the "Gardeners' Magazine," 1909.—Those readers who have preserved the 52 numbers of the Gardeners' Magazine for 1909 with a view to having them bound for future reference, can obtain Handsome Cloth Binding Cases from the publishers, 148 and 149, Aldersgate Street, London, price 2s., post free. The index, with title page, is now ready—price 2d., or by post 2½d. The volume bound complete will also be ready in a few days, price 12s. 6d., by post 13s. 4d.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

SOIL DISINFECTANT.—A. F., Hayes: We have no knowledge whatever of the material sent us; indeed, have not previously heard of it. We are having the sample dealt with, and will report later on.

SWEET PEA HISTORY.—F. S., Brighton: You will find a very complete story of the history and evolution of the sweet pea in "Sweet Peas and Their Cultivation," by C. H. Curtis, issued at 1s. 2d. to 1s. 8d., post free, from the GARDENERS' MAGAZINE office, 148, 149, Aldersgate Street, E.C.

WINTER SPRAYING.—F. E. F., Kildare: All things considered, February is the best month for spraying fruit trees with a caustic winter dressing. A caustic paraffin emulsion will cleanse the trees of lichen, moss, scale, aphis, and many other pests. A dressing of this kind will not be necessary every year, every second or third year being sufficient.

GREENHOUSE PRIMULAS. — H. R., Leatherhead: You will find a great deal of pleasure and satisfaction in growing such primulas as P. floribunda, P. verticillata, P. Kewensis, P. obconica, P. Forbesi, P. cashmeriensis, the new P. malacoides, and also P. frondosa, P. Sieboldi, P. nivalis, and P. denticulata in your greenhouse. Several of the latter are hardy, but they are charming for frame and greenhouse culture.

PROPAGATION FROM BUDS.—Student, Chesterfield: There are two distinct methods of increasing plants by means of buds, and both are of sufficient importance to justify the details being mastered. The first is the insertion of buds in various stocks during the season, as in the case of the budding of roses. The second is the cutting up of shoots during the season of rest, and rooting them in soil, as in the propagation of grape vines from buds or "eyes." All kinds of fruit and ornamental trees, and the majority of hardy shrubs, may be increased by what is technically known as budding. In the raising of dwarf roses, the briar, manetti, or other rose stocks are planted six or eight inches apart in rows with two-feet spaces between them. The stocks previous to planting, which should be done early in November, are shortened sufficiently for the tops to be four or five inches above the surface. In July of the year following the budding of the stocks may be proceeded with, provided they are moderately vigorous. The buds are inserted on the main stem, and, as it is necessary they should be as low down as possible, the soil is drawn away from one side to allow of the insertion of the buds below the surface. Lilacs and other shrubs should be dealt with in practically the same manner. In the case of briar stocks for standard roses, the buds are inserted on the upper side and near the base of the shoots of the same season's growth. But when stocks of rugosa and other roses are used, and in the case of fruit and ornamental trees, the buds should be inserted on the main stem, and not on the new growths. It is essential to success that the budding be in all cases done when the bark parts readily from the stem, and the stocks should be examined from time to time from the end of June onwards. The stock is prepared for the buds by making T-shaped cuts, an inch or so in length, and then raising the bark on either side with the handle of the budding knife. The buds are, of course, taken from shoots of the current year's growth. The buds which are in the axils of the leaves, are taken off with a small slice of wood, about one and a-half inches in length, the wood is removed, and the shield-like piece of bark is slipped into the cut, and the upper portion of the bark above the cross cut is cut level with it. The bud is secured in position with bass, raffia tape, or other suitable tying material.

GOOSEBERRY RED SPIDER.—L. G., Hythe: This pest is capable of doing a great deal of harm to gooseberries, consequently where it has gained a footing strong measures should be taken to dislodge it. The best method of attacking it is to spray the bushes with a caustic winter dressing or a paraffin emulsion, quite early in March. The eggs laid last June hatch out in February and early in March, and while still young they succumb to the spraying, and if the work is carefully carried out there should be very few left to lay their eggs in the coming summer. Keep a sharp look out for the pest, and first spray with a caustic solution, and then, in a week or so, if the first spraying has not been wholly successful, spray with a weak paraffin emulsion.

TESTING GUANO.—B. H. J., Littleport: The test you refer to is the M'Connel test. It is as follows: The colour of the guano

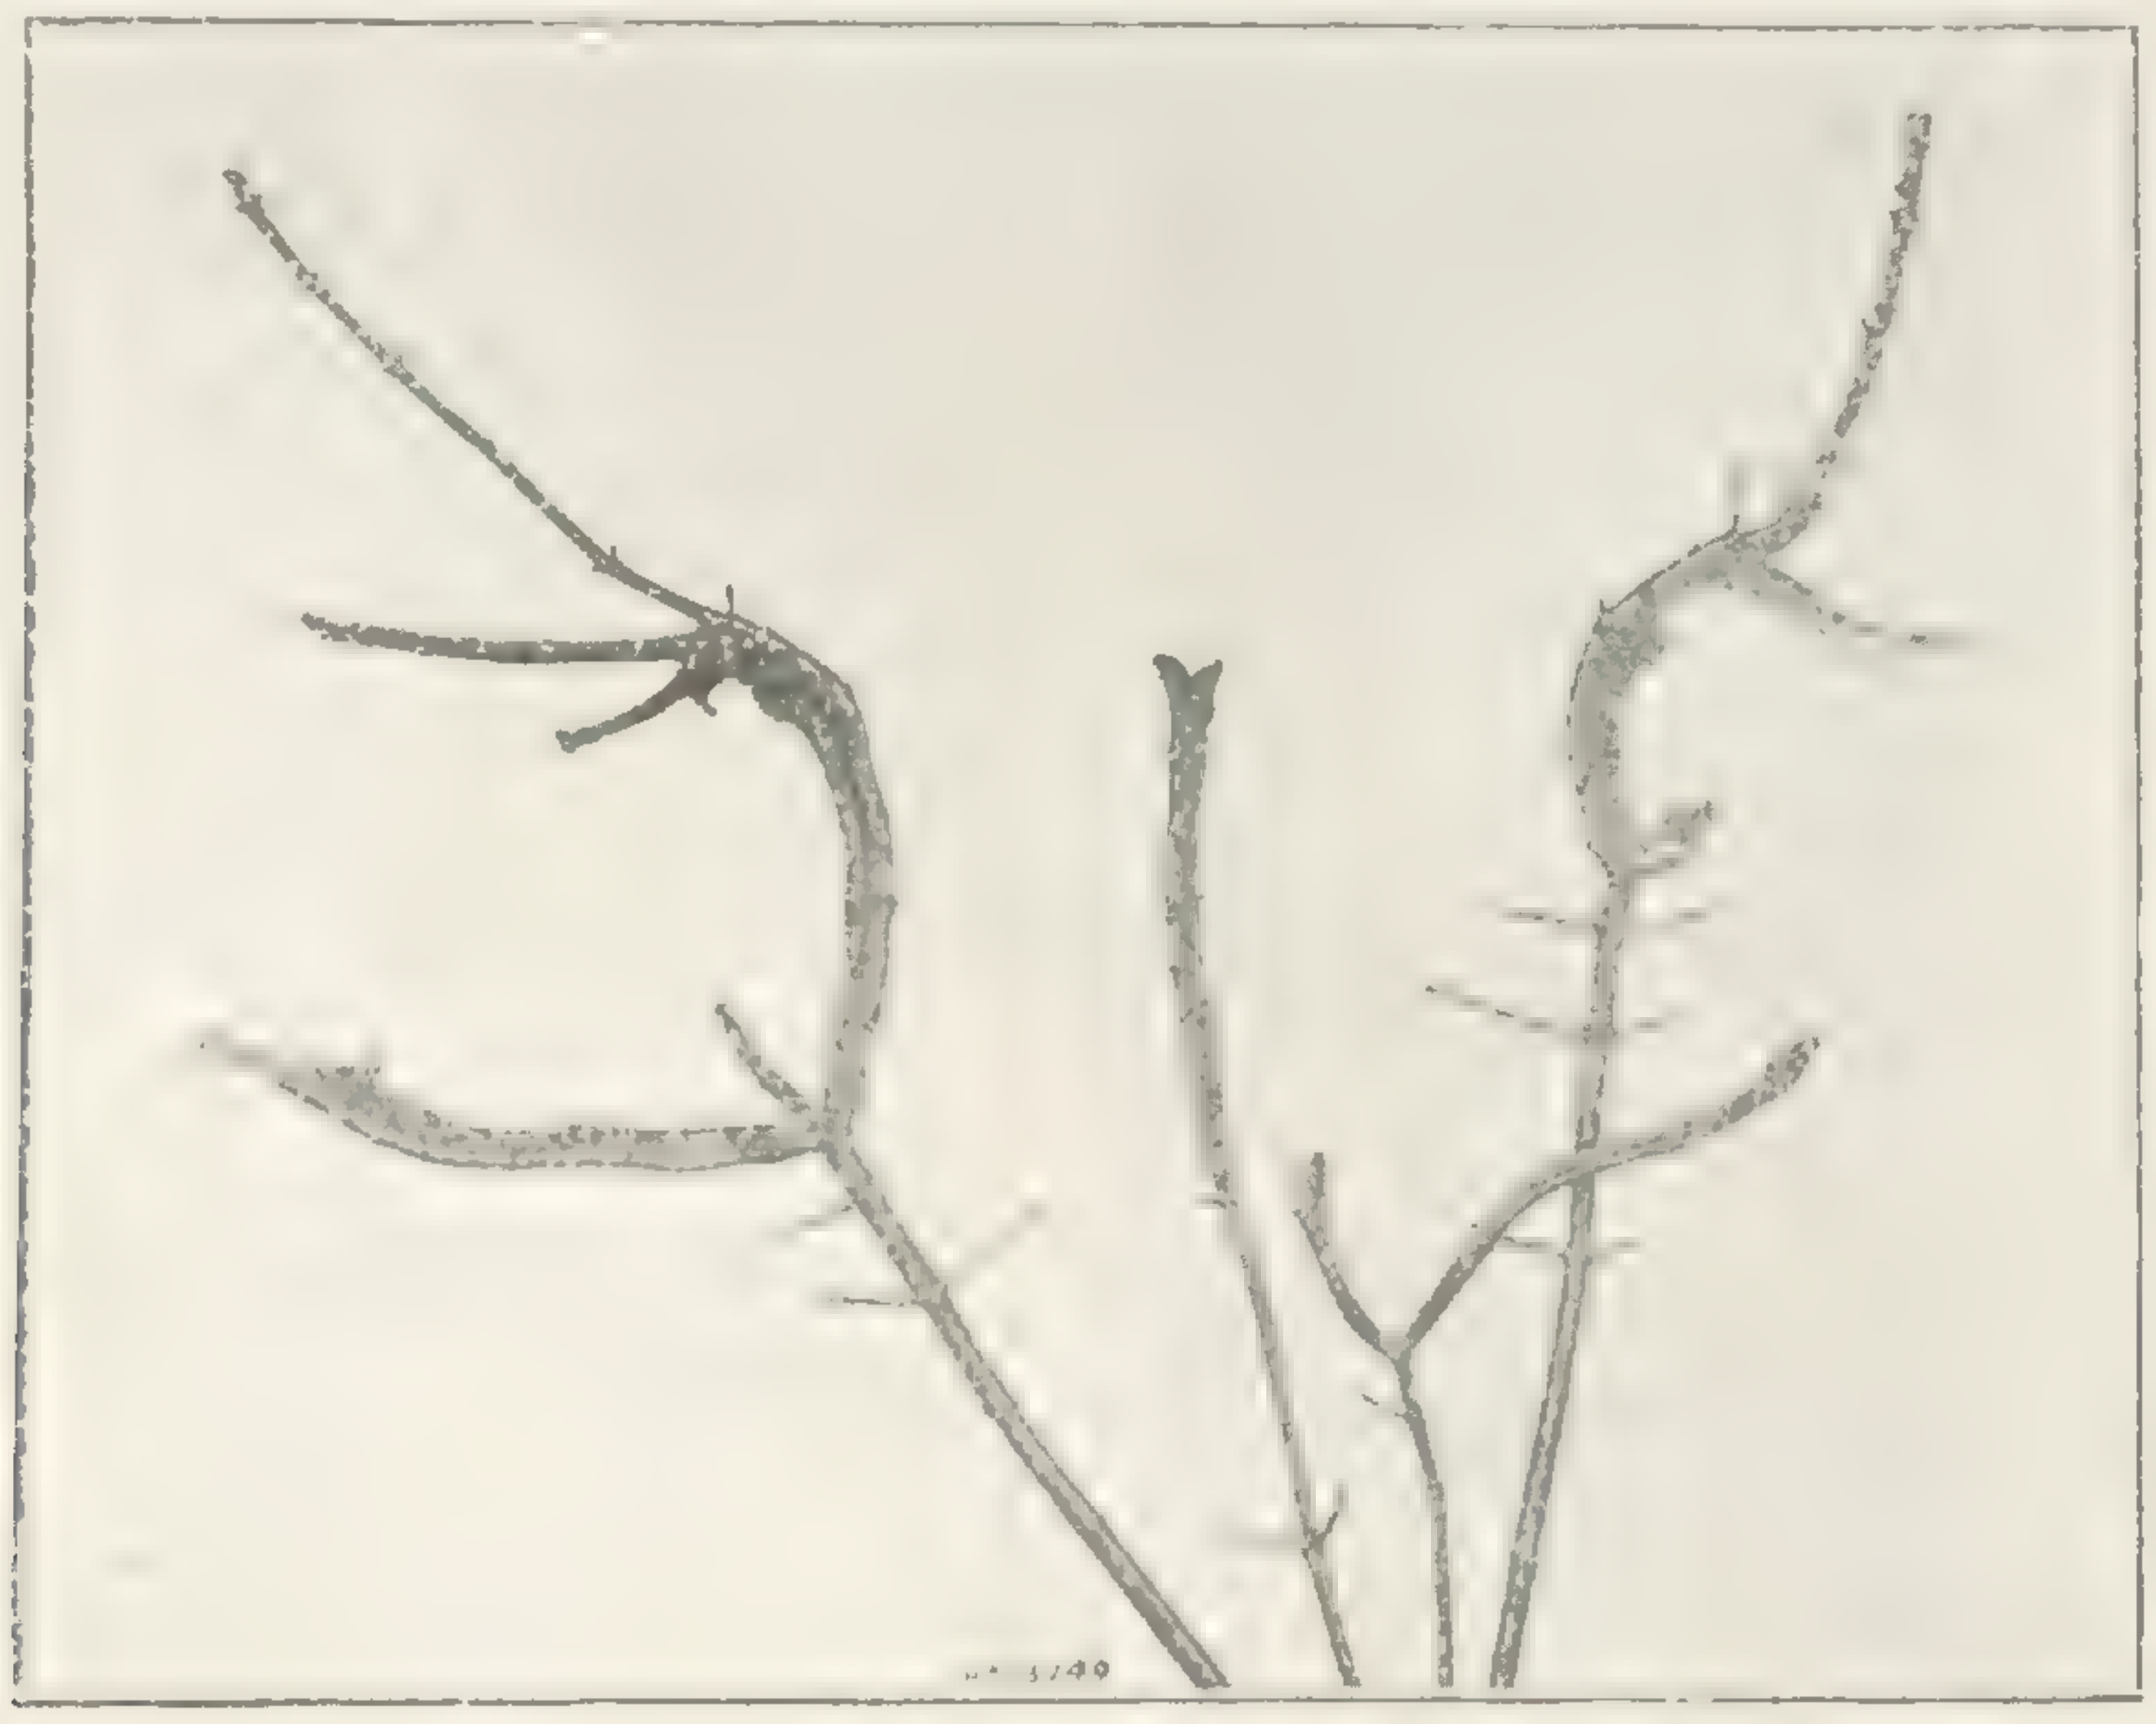
CARRIAGE PAID on orders of 40/- value to most Goods Stations in England.

should be that of coffee and milk. If too grey it is earthy: if too brown it has an excess of water. It should be strong, salt, piquant, and caustic to the taste. It should smell strongly. To the touch the guano should be oily; it should be in small grains, these sometimes adhering in large pieces. If rich in urates it will appear shining and crystallised when broken. If placed in contact with a flame good guano should blaze up quickly and leave a residue of charcoal ash. Guanos poor in organic matter give less charcoal residue. Mixed with quicklime, a good guano will give a strong evolution of ammonia. In the matter of weight guano should be from 60 to 70lb. per bushel.

FASCIATION IN HARD WOODS.—D. R. M., Malpas: Fasciation is of fairly common occurrence among quick-growing soft-stemmed plants, and is quite frequently observed in tomatoes, cucumbers, and liliums. It is occasionally found in hard-wooded trees, and would probably be more often found if woodlands were as carefully examined and kept under as close observation as a garden. The little illustration herewith shows a sycamore growth with a number of fasciated shoots. In this case the buds fused, and the growths become joined or attached as they grew, making a flattened and curved growth, for, though joined, one shoot often takes the lead, but is curved because of the strong pull of its slower-growing mate.



FASCIATED SYCAMORE STEMS.

NAMES OF FRUITS.

When sending fruits for naming, will our readers be good enough to send good specimens, as without these it is not possible to accurately determine the varieties. Pack firmly, using light tin or wood boxes, and send not more than six varieties at once. Label each specimen and enclose letter with the fruit, whether a separate notification is sent or not. Address the packages to the Editor, Gardeners' Magazine, as advised in the notice at the head of "Answers to Correspondents."

E. H. C., Tunbridge Wells.—Not recognised.

H. B., Southminster. — No. 2 is Beurre d'Aremberg; the other we do not recognise from the specimen sent.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

C. A., Gloucester.—Send the berberis when in flower; 2 is probably a Vriesia, send when in flower.

M. E. J., Wrexham.—1, Pteris Wimsetti; 2, P. semi-pinnata; 3, Polypodium aureum; 4, Cyrtomium falcatum.

A. W., Newport.—1, Veltheimia viridifolia; 2, Coronilla glauca.

J. S., Leyton.—A species of sedum; later on, if you will send a well-developed shoot and leaves, preferably with a flower spike, we may be able to identify it for you.

TRADE NOTES.

From time well-nigh immemorial the blue apron has been the outward sign of the gardening craft, and probably at no period in the history of gardening in this country has this necessary article of dress enjoyed so high a degree of popularity as at the present time. It is not unreasonable to assume that Messrs. Shaw and Montgomery, of 628, Argyle Street, Glasgow, have by the introduction of their manufactures helped materially to bring about this salutary change. Whether it be the case or not, the fact remains that the firm has placed at the disposal of gardeners aprons of high quality, and so inexpensive as to be within the reach of all who have positions in gardens. We call attention to the matter now because this is the season of the year when such matters as the renewal of aprons receive attention, and we do so with pleasure, because we are in a position to speak of the aprons from practical acquaintance with them. It is now twelve months since we obtained from Messrs. Shaw and Montgomery one of their serge aprons, and although we have had it in constant use, it is not as yet any the worse for wear. The cheaper twill apron is equally good, in its way, and is by some of our friends preferred for wearing in glass structures maintained at high temperatures, and for use in the summer months.

With the very laudable desire to keep their numerous and excellent specialities in insecticides, fungicides, manures, and sundries before the gardening public, Messrs. Joseph Bentley, Lim., Barrow-on-Humber, Hull, have issued a diary and blotter that is very handy for the garden office. There is a fortnight on each page, room for notes, and a sheet of blotting paper to keep all clean and neat, and also remind one of the best time for using certain specialities.

CATALOGUES RECEIVED.

WATKINS AND SIMPSON, 12, TAVISTOCK STREET, COVENT GARDEN.—This is a very comprehensive seed catalogue, including the firm's specialities, and all the leading varieties of flowers and vegetables. It is admirably illustrated from photographs taken in their trial grounds. It is wholly and solely a wholesale catalogue, and, therefore, only for traders.

G. MASSEY AND SONS, SPALDING.—A useful catalogue of selected varieties of flowers and vegetables, including a list of seed potatoes.

FIDLER AND SONS, READING.—Although flower seeds are not omitted, the chief place in this catalogue is given to vegetable selections. Peas and potatoes are very prominent.

W. DRUMMOND AND SONS, DAWSON STREET, DUBLIN.—A large and freely illustrated catalogue of vegetable and flower seeds, plants, lilies, tools, and sundries.

THOS. S. WARE, LIM., FELTHAM.—A concise list of garden seeds, and also a very interesting and handy catalogue of tuberous begonias that includes nine new double varieties offered for the first time.

WM. PAUL AND SONS, WALTHAM CROSS.—The finer types of vegetables and garden flowers are well illustrated in this firm's seed catalogue. Rigid selection of kinds and varieties has been practised.

M. F. E. HALLAM, MOSELEY, BIRMINGHAM.—Sweet peas occupy a prominent place in this handy catalogue of seeds, tubers, herbaceous plants, and sundries. Sweet peas are illustrated in colours on the cover.

GEO. COOLING AND SONS, BATH.—This firm is offering a quite considerable number of novelties in flower and vegetable seeds, and their catalogue is an interesting one.

WM. FELLS AND SON, HITCHIN.—A little pocket catalogue of sweet peas—"The Queen of Annuals." The descriptions are good.

JOSEPH BENTLEY, LIM., BARROW-ON-HUMBER, HULL.—A catalogue for the bookshelf. It contains all this firm's specialities in weed-killers, nicotine compounds, and other insecticides, spraying mixtures, fungicides, shading materials, patent manures, paints, and tools of various kinds.

DANIELS BROTHERS, NORWICH.—Capitally and freely illustrated this catalogue from East Anglia contains a wealth of information, descriptive and cultural, and merits its title of "Illustrated Guide for Amateur Gardeners."

WM. WOOD AND SON, LIM., WOOD GREEN, LONDON, N.—A very handy catalogue, devoted entirely to fencing in various materials and patterns, and suitable for a variety of purposes, useful and ornamental. We have also received a small catalogue of this firm's special manures.

W. W. JOHNSON AND SON, LIM., BOSTON.—This firm's retail seed list includes such floral novelties as Yankee sweet pea, Diadem sweet william, and Blush Queen aster, besides several new vegetable selections.

THOMSON'S CELEBRATED MANURES.
For full advertisement see page 139.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

NATIVE GUANO

BEST and CHEAPEST MANURE for VEGETABLES, FRUITS and FLOWERS.

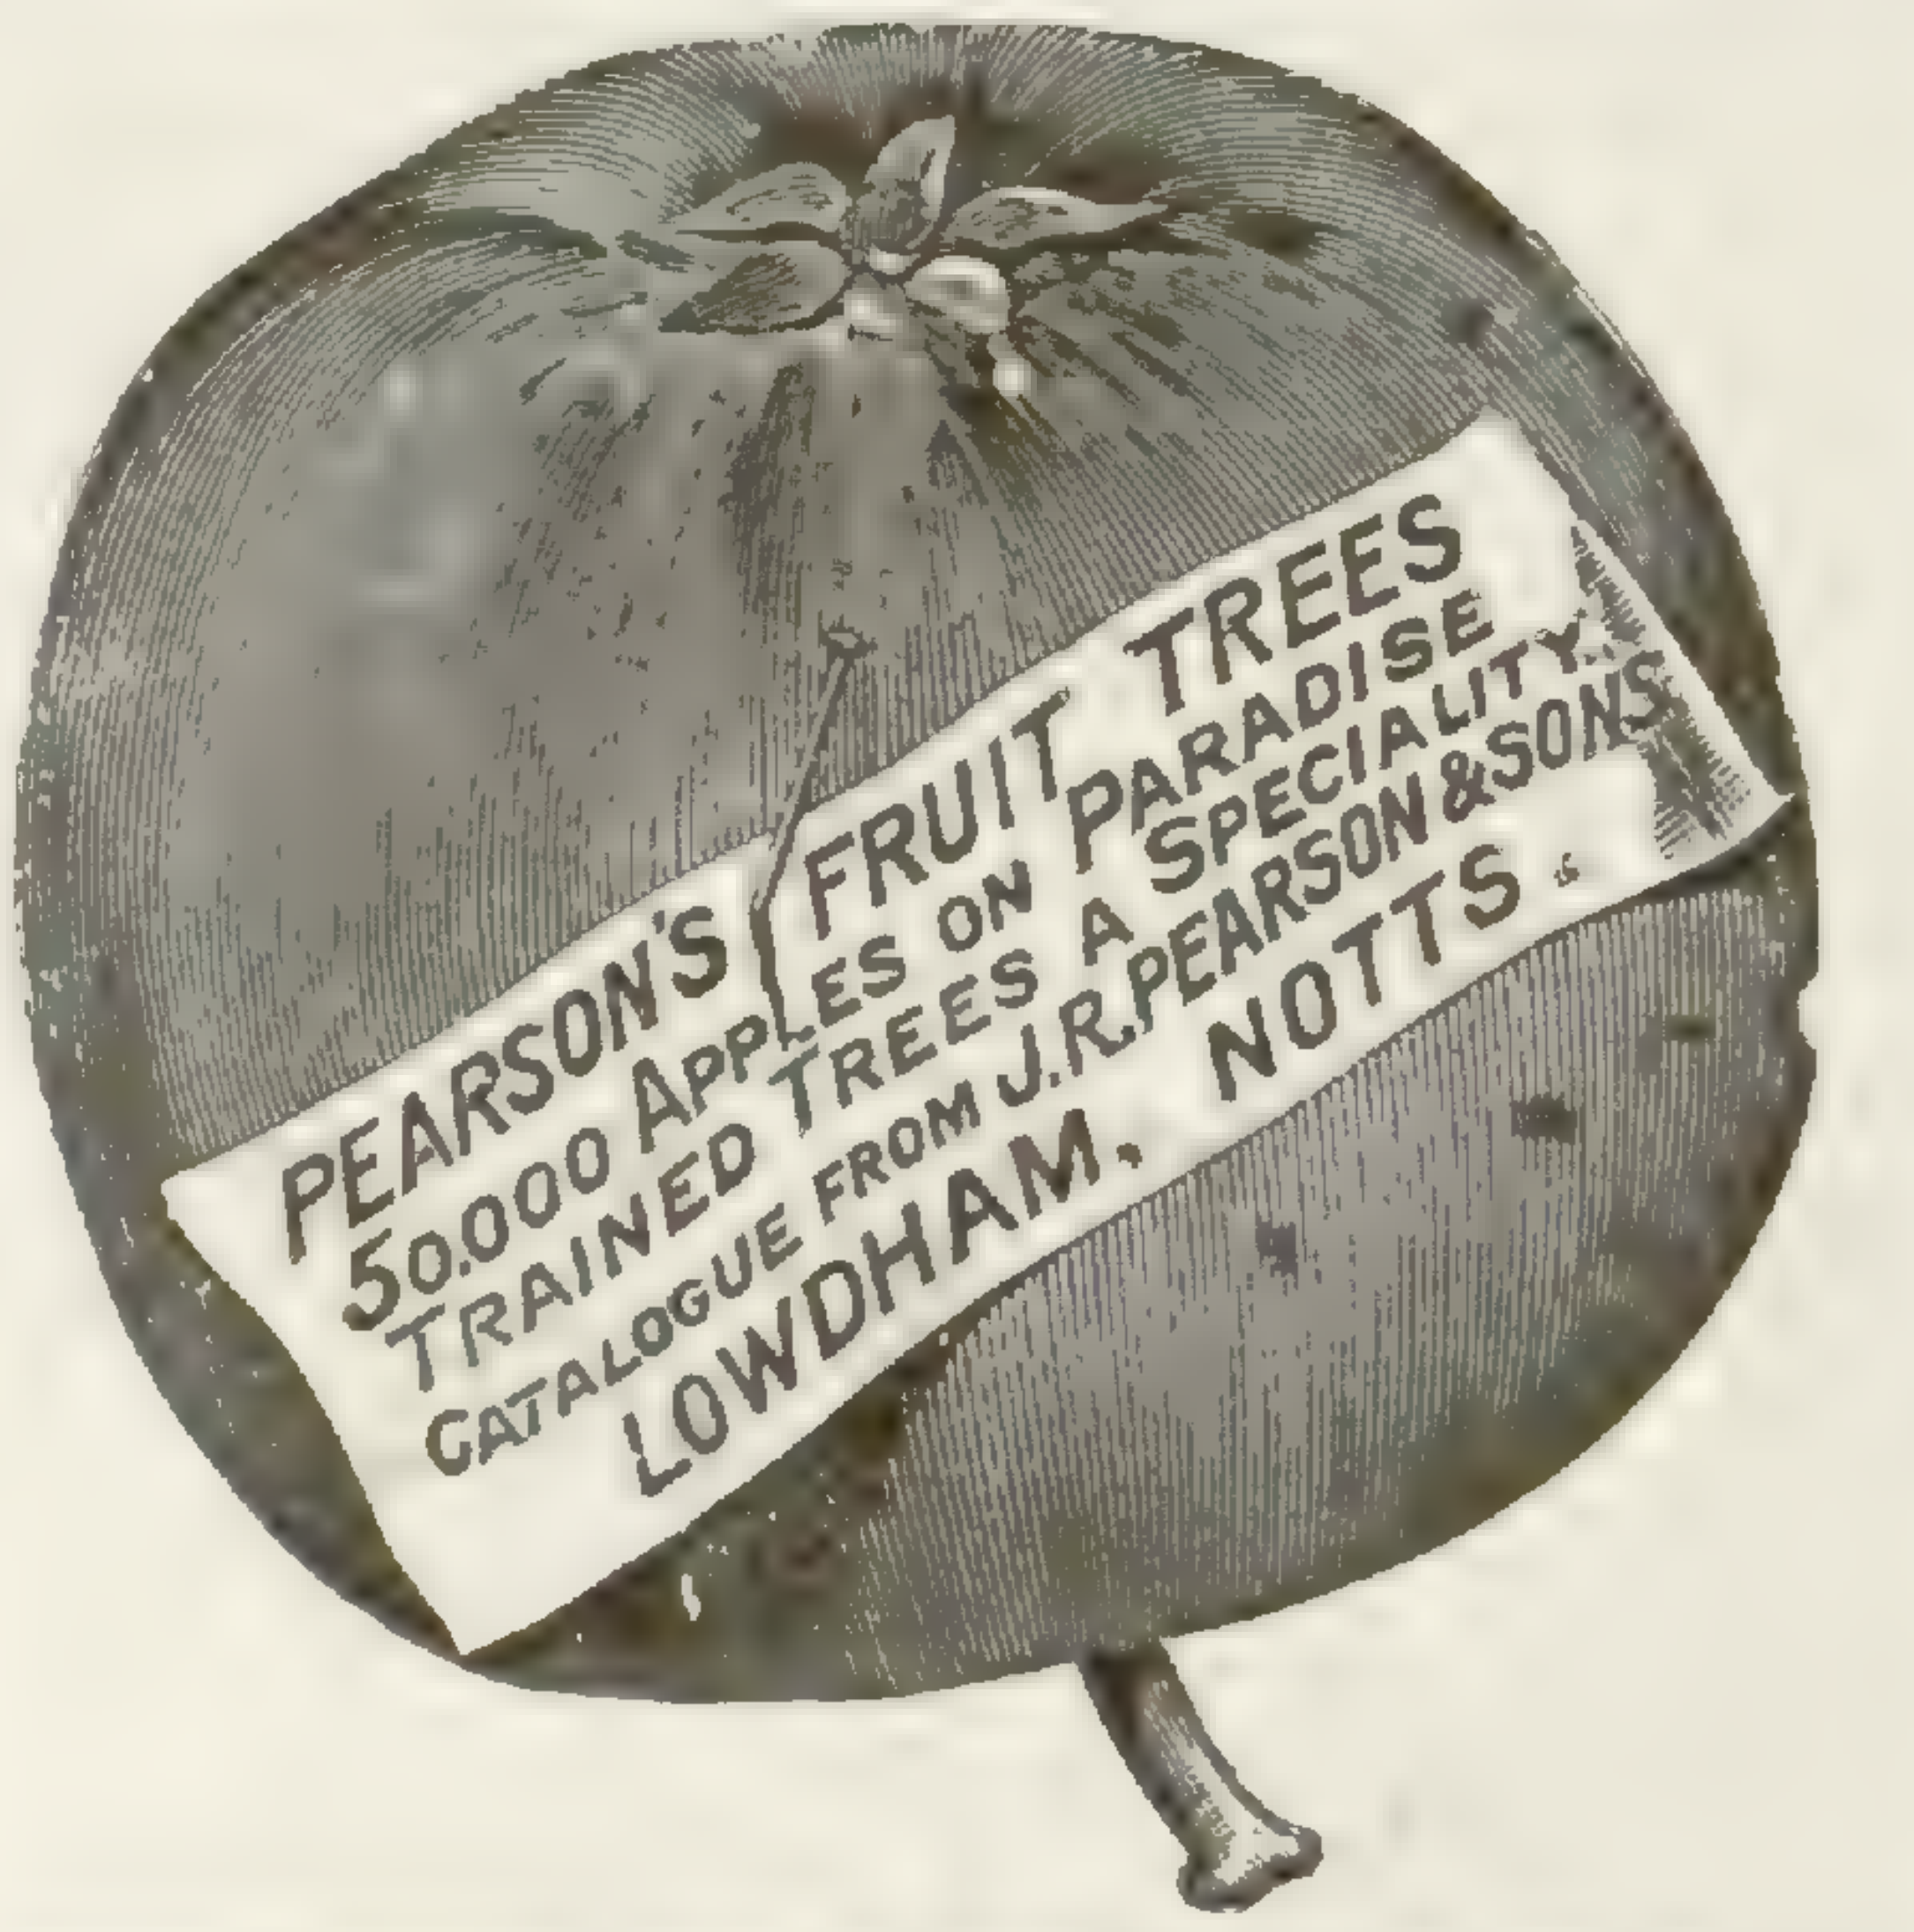
Price **£3 10s.** per ton in bags. Lots under 10 cwt. **4s.** per cwt. at works; or **5s.** per cwt., carriage paid to any station in England.

Extracts from 32nd annual collection of reports:—
NATIVE GUANO for POTATOES, VEGETABLES, etc.
J. HAYDON, Hampton: "Potatoes, excellent crop; none diseased. Grand for keeping away slugs."
G. PERRY, Westcliffe: "Peas and onions splendid"
NATIVE GUANO for FRUIT, ROSES, TOMATOES, etc
A. W. BRINKHAM, Hull: "Cucumbers, tomatoes, and chrysanthemums highly satisfactory." G. ACCLETON, Carlisle: "Finest manure ever used for vines, peaches, roses, carnations, etc." W. COOPER, Shoeburyness: "Most excellent for roses."

Orders to the **NATIVE GUANO CO., LIMITED,** 29, New Bridge Street, London, E.C., where 32nd year's testimonials, etc., may be obtained. Agents Wanted.

AMARYLLIS, AMARYLLIS, AMARYLLIS (Hippeastrums), exceptional offer, 1s., 1s. 6d., 2s. each; 10s., 15s., 20s. doz.; well worth double. Send for my 48-page Ctg. of Bulbs and Seeds on approval. ELLISON, 57, West Bromwich.

BOX'S BEGONIA SEED, quality and quantity. Choicest single mixed, double mixed, Crispa single frilled, each per pkt., 1s., 1s. 6d., and 2s. 6d. Catalogue free. JOHN BOX, Begonia Grower, Croydon.



PEARSON'S FRUIT TREES
50,000 APPLES ON PARADISE
TRAINED TREES A SPECIALITY.
CATALOGUE FROM J. R. PEARSON & SONS
LOWDHAM, NOTTS.

GOLD MEDAL ROSES.

Strong, healthy, well-rooted plants of all classes: Standards, Bushes, and Climbers. Also Fruit-trees, Shrubs, etc. Trained Fruit-trees are especially good this year. Send for Catalogue.

WILLIAM LOWE, Rose Nurseries, BEESTON, NOTTS.

ORCHIDS.

Our **NEW ILLUSTRATED CATALOGUE of CHOICE and VALUABLE PLANTS and GENERAL COLLECTION OF THE ABOVE** is now being circulated. Should anyone interested in these species not have received a copy we shall be pleased to send one free by post on receipt of a card.

STUART LOW and CO.,
BUSH HILL PARK, MIDDLESEX.

SPECIAL PRIZES

Will be offered for the following at the National Vegetable Society's Show, 1910.

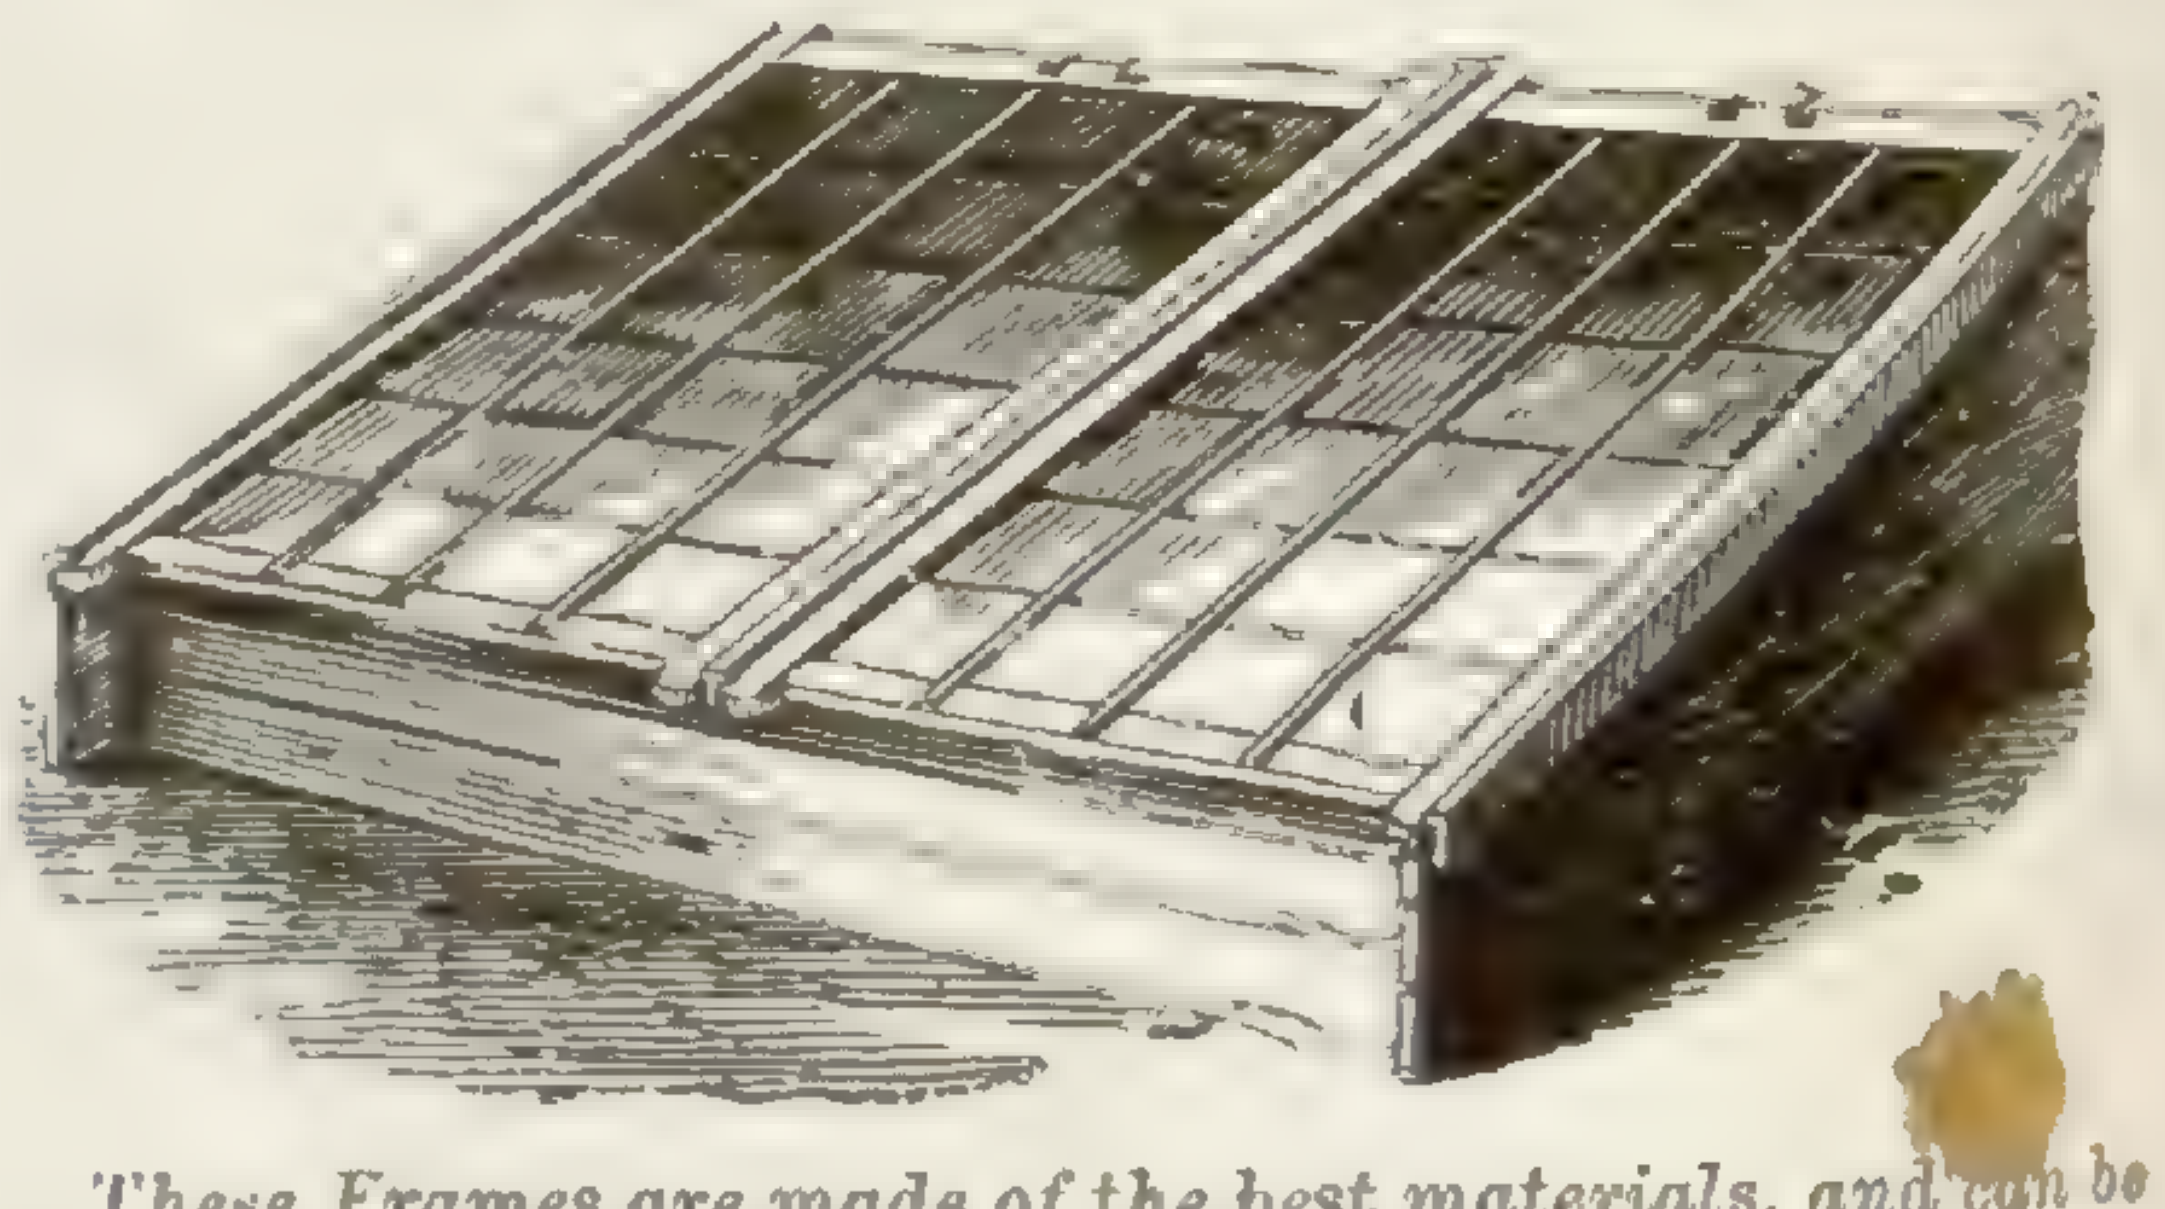
BEET, Massey's Improved Black, per packet, **6d.** and **1/-** post free.
ONION, Massey's Selected Ailsa Craig, per packet, **6d.** and **1/-**, post free.
POTATO, Massey's Universal, per lb. **9d**; 7lb. **3/-**; post free. *Illustrated Catalogue post free.*

GEO. MASSEY & SONS, Seedsmen, Spalding.

GREENTWIST.—Add to the neatness of garden and greenhouse by tying plants with our soft Greentwist; extremely neat effect; try it; 3 balls, 1s.; six, 1s. 10d.; dozen, 3s. 6d.; p. paid. ROBERTSON, IRELAND, and CO., Dundee.

PORTABLE CUCUMBER FRAMES.

OUR WELL-KNOWN MAKE.



These Frames are made of the best materials, and can be put together and taken apart in a few minutes by anyone.

Sizes and Prices, Glazed and Painted.		£	s.	d.

Larger sizes at proportionate prices.

R. HALLIDAY & CO.,
Royal Horticultural Works,
MIDDLETON, MANCHESTER.

Barr's
Lawn Phytobroma
The best Manure for all Lawns

The most economical of all artificial manures, 2 oz. to the square yard only being required.
Per cwt., **20/-**; ½-cwt., **12/6**; 28lb., **7/6**; 14lb., **4/6**; 7lb., **2/6**; sample tins, **1/-**.
Prepaid Orders for 28lbs. and upwards, carriage paid.
Circular with full particulars, on Application.

BARR & SONS,
11, 12, & 13, KING STREET, COVENT GARDEN, LONDON.

SALE PRICE! SALE PRICE!—Are you a Bulb Grower? If so, my marvellous clearance offer of bulbs will interest you. The reductions in prices are very great and the bulbs are in excellent condition. ELLISON, 57, West Bromwich.

TREE CARNATIONS.—Best varieties, rooted cuttings, 25, 4s. 6d.; 100, 15s. Plants in pots, 25, 6s.; 100, 22s., carriage paid.—G. S. EVANS, F.R.H.S., Bexley Heath.

Sales by Auction.

SALES NEXT WEEK.

MONDAY and FRIDAY NEXT, February 14th and 18th, at Twelve o'clock.—New and rare Perennials, Border Plants and Bulbs, Liliums, Gladiolus, Tuberoses, etc.

At Half-past One o'clock.—1,000 Roses, dwarf, climbing, Tea, etc. Azaleas, Rhododendrons, etc.

WEDNESDAY NEXT, February 16th, at Twelve o'clock.—Choice Herbaceous and Border Plants, Perennials, Flowering Shrubs, Liliums, Begonias, Gladiolus, Lily of Valley, Tuberoses, etc.

At Half-past One o'clock.—3,500 Roses, standard, dwarf, climbing, etc.; also Fruit Trees in variety.

At Five o'clock.—100 lots of Ornamental Palms and Plants, 400 Azaleas of sorts, 100 Rhododendrons, Camellias, etc.; also Ferns and Greenhouse Plants.

MESSRS. PROTHEROE and MORRIS will SELL the above BY AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, E.C. On view morning of Sale and Catalogues had.

BULBS, ROSE TREES, SHRUBS.

Every MONDAY and WEDNESDAY, AT 12.30,

STEVENS' AUCTION ROOMS (Est. 150 Years).

38, KING ST., COVENT GARDEN, LONDON.

CATALOGUES ON APPLICATION.

DAWES' CHALLENGE RHUBARB ROOTS, strong for immediate planting; this variety has obtained five first-class awards and medals. Catalogues and cultural directions post free. DAWES' NURSERIES, Syderstone, Norfolk.

GERANIUMS, Paul Crampnell, 16s. per 100, out of small 60 pots, put on rail; package free. Cash with order.

J. KIMMENS, Florist,
Youngs Road, Ilford, Essex.

---

25 STRONG CHRYSANTHEMUM CUTTINGS, Exhibition, Decorative, Single or Early, 1s. 6d.; 50, 3s.; 100, 5s. 6d.; by return. List. RICHMOND'S CHRYSANT. NURSERIES, Ossett, Yorks.

FERNS, FERNS, FERNS, Etc.—Foliage and Blooming Plants for stove, greenhouse, and garden. Wholesale list or amateur catalogue No. 100, free. 5,000 cases sent off yearly. J. E. SMITH, London Fern Nursery, Loughborough Junction, S.W.

TREE TOPPING.—Dangerous trees lopped, topped, or taken down; dead branches carefully removed by experienced Men; own risk; highest testimonials. GEO. BANKS, 20, Caroline Road, Wimbledon, Surrey.

WANTED.—BROWN SULTAN CALCEOLARIA TOPPINGS, also LOCKWOOD VIOLA CUTTINGS and CECILIA VIOLA, CUTTINGS.

J. KIMMENS, Florist, Youngs Road, Ilford, Essex.

ARMY BLUCHERS.—4,000 pairs, all sewn, best leather; any size, 5s. 6d. pair, post free; cash returned if not approved of.—H. J. GASSON, Government Contractor, Rye.

PROTECT YOUR BUDS, OR YOU WILL GET NO FRUIT. Garden Netting, extra quality, small mesh, tanned, as supplied BY US to the Royal Gardens; 50 yds. by 1 yd., 2s.; by 2 yds., 4s.; by 4 yds., 8s.; by 7 yds., 14s. Any size, and cheaper kinds made. Carriage paid on orders over 5s.—H. J. GASSON, Net Works, Rye. Est. 126 years.

EPPS'S SELECTED PEAT

For Choice Plants, Ferns, Rhododendrons, &c., &c.

SPECIAL ORCHID PEAT.

Loam, Leaf-mould, Sand, C.N. Fibre, Sphagnum, Charcoal, and all kinds of Garden Sundries.

Prices on application to

EPPS & Co., Ringwood, HANTS.

BOROUGH OF CAMBERWELL.

PARKS AND GARDENS SUPERINTENDENT.

The Council invite applications for the position of PARKS and GARDENS SUPERINTENDENT. Salary and emoluments £150 per annum, rising by annual increments of £10 to a maximum of £200 per annum. In the event of residence, coal, and gas, or any or either of them being provided such emoluments shall be considered as part of the salary at an amount to be fixed from time to time by the Council. The duties are to be responsible under the Borough Engineer for all the Public Parks, Gardens, and Roadside Trees, including laying out, bedding, planting, etc., and to superintend men, horses, and vehicles used in connection with this work.

Applications, which are to be made on forms to be obtained from the undersigned (if by post by forwarding a stamped addressed envelope), must be delivered at the TOWN HALL not later than NOON on TUESDAY, March 1st, 1910.

Personally canvassing members of the Council will disqualify. Appointments will be subject to medical examination, and to the provisions of the Camberwell Superannuation Act, 1908.

C. WILLIAM TAGG, Town Clerk.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Temperature.

Temperature is such an important factor in plant life, and successful culture is so dependent upon some knowledge of the conditions which determine it in its relation to exotics, that a little consideration of the subject cannot be out of place. In the first place, in a general way, we may say that the temperature of the air is highest at the Equator and lowest at the Poles. This is due, of course, to the fact that at the Equator the sun rises due east and sets due west, its daily course being a semicircle traced perpendicularly to the horizon, so that at noon the sun is directly overhead. His rays, consequently, strike then directly downward on to the surface, and throughout the day do so more directly than elsewhere. At the Poles the sun appears to move in a circle perfectly parallel to the horizon, and hence during the winter months it remains constantly beneath it, and during the summer circles regularly above it. In the temperate zone the sun's course is intermediate, varying with the longitude and with the seasons, rising diagonally at an angle with the horizon, and pursuing a longer or shorter course, as the case may be. At the Equator, therefore, the days and nights are equal all the year round, and there are practically no seasons, as in the temperate zone; there reigns, indeed, a perpetual summer, instead of a gradual alternation of summer and winter, with the intermediate stages of autumn and spring under which our native plants have been evolved, and are thus capable of withstanding the frosty conditions incidental to the cold and comparatively sunless period. Temperature, however, is by no means entirely dependent upon geographical situation; there is another set of conditions to be considered, viz., those appertaining to elevation above the sea level. All over the world it is only necessary to rise into the air sufficiently far to find intense cold prevailing, merging into the infinite cold of space itself, and, as a result, even in the Tropics, where lofty mountains exist, we find if they are high enough that their summits are capped with perpetual snows, and their upper valleys filled with mighty glaciers, the only difference between such accumulations and those of higher latitudes being a greater elevation above the sea level. It is a curious fact that though in these lofty regions the solar rays strike naturally as directly as on the plains far below, they have no warming effect more than at and above the snow level elsewhere, the sun's heat only making itself felt by warming the surface and adjacent air layer where its power accumulates in direct ratio with the density of the air its rays traverse, and their direct or indirect impact as above explained. In brief, a balloonist or aeronaut at the Equator would freeze to death at noon in the full solar blaze, if he rose to a sufficient height in the air. Since, then, it is precisely the mountains which afford the most varied conditions, and have thus aided in evolving plant life on very diverse lines to fit the varied habitats and environments, it is clear that it by no means follows that plants from tropical regions are less hardy than those of temperate, or even Arctic ones. All depends upon the heights at which they grow, and thus all over the world we may find hardy alpine plants near the snow line, half-hardy ones lower down, and at the sea level, the tenderest ones, according to the part of the world in which they grow. In some of the magnificent valleys of the Himalayas travellers tell us that in a single downward view embracing their flanks from snow line to foothills, plants fitted for all temperatures may be seen. The primula tribe and other alpines close at hand, while the rhododendrons are flooding the slopes with vast masses of bloom, and other hardy plants prevail; lower down these give place to tenderer ones suitable for greenhouse culture only; while, when the plains are approached, palms and other tropical vegetation clothe the landscape instead, and the hardier tenants of the higher regions have entirely disappeared. As it is frost which kills tender plants by destruction of their tissues, and there appears no reason why warmth, unless of a scorching nature, should be destructive, it seems curious that most hardy plants resent warm culture, and perish if it be persisted in. This, however, is a matter of constitution. Hardy plants have been evolved to fit cool conditions; their periods of active growth and rest are determined accordingly; and thus, to transfer a plant of temperate climes to tropical ones upsets its life cycle, enfeebles it, and eventually proves fatal.

MR. D. INGAMELLS.

Mr. David Ingamells, of Covent Garden and Maidenhead, is one of the best known and best liked men among the horticulturists who do business in our great metropolis. With a jovial countenance, a kindly heart, a generous hand, and unfailing good humour, he has natural gifts that endear him to all who are fortunate enough to enjoy his personal acquaintance. Born in Lincolnshire, Mr. Ingamells began his gardening career at Woodhall Spa, where he served for seven years, and laid the foundation of that practical knowledge that has stood him in good stead in later years. From Woodhall Spa Mr. Ingamells came to Maidenhead, where he entered service with the late Mr. Robert Owen, of chrysanthemum fame; this was in 1886, and he remained with Mr. Owen until 1894, when he set out to make his own way and fortune, by commencing business as a flower salesman in Covent Garden. Confining his attention almost wholly to cut flowers, Mr. Ingamells has built up an excellent connection, and, living still at Maidenhead, he has there developed a nursery for the benefit of many of his customers, for whom he caters on wholesale lines. Mr. Ingamells, like most other busy men, finds time for other things than his business of life, and he has devoted a great deal of his spare time to the work of the National Chrysanthemum Society, in the councils of which he is a prominent member of the younger and progressive party. He was the great mover in the Market Chrysanthemum shows that were held at Covent Garden for several years, and he is a prominent, energetic, and very useful member of the N.C.S. Floral Committee. As a judge of florist's flowers his services are in great request, indeed, oftener than he can give them. Lastly, but not least, Mr. Ingamells readily acknowledges the sacred claims of charity, and freely gives money, time, and influence to advance the interest and benefits of the Royal Gardeners' Orphan Fund, as a member of its committee.

Gardeners' Magazine Spring Number.—Our annual issue specially associated with the spring season will be published on the 26th inst., and the arrangements we have made justify the suggestion that it will be one of the most attractive and useful of the many spring numbers we have published. Special attention will be devoted to rock gardening, and in the several articles dealing with this fascinating subject the owners of both large and small gardens, and those who are concerned in their management will find much to interest and instruct them. There will be numerous articles on the cultivation of vegetables and ornamental plants, and these will chiefly deal with matters requiring attention during the spring season. The number, we would add, will be profusely illustrated.

Appointment of Chief Officer of the London Parks.—At the meeting held on Tuesday last the London County Council appointed Major C. H. Enthoven, R.E., chief officer of its Parks Department, and the appointment of a military man to a post in which a special knowledge of the higher branches of horticulture is desirable has given rise to considerable criticism among horticulturists. The General Purposes Committee reported that, in reply to the advertisement for a chief officer of the Parks Department, at a salary of £600 a year, 95 applications had been received. Nine names were referred by the Parks Committee to the General Purposes Committee, which selected three names to be submitted to the Council, and recommended the appointment of Major C. H. Enthoven, R.E. The other two names submitted were, we would mention, those of Mr. A. J. Allsop and Mr. W. W. Pettigrew, both of whom are well known for their remarkable ability. On the report being submitted, Mr. J. D. Gilbert moved that it be referred back to the committee. He stated he had nothing to say against Major Enthoven, but the advertisement stipulated that "a knowledge of surveying, landscape gardening, forestry, and horticulture is desirable." As Major Enthoven was only qualified in surveying, he thought an explanation was called for. The Rev. F. Hastings seconded the motion. Mr. Swinton said they did not want a gardener, but a man qualified to administer a large department with a staff of 950 men, of whom 320 were park keepers. Sir John Benn protested against the recommendation of the General Purposes Committee, and explained that his objection was not to the fact that the candidate was a military man, but that, whereas the Council advertised for a man with certain qualifications, the candidate selected by the General Purposes Committee over the heads of the Parks Committee did not possess them. In the result the amendment was rejected by 55 votes to 39, and, as already stated, Major Enthoven was appointed.

Extension of Wimbledon Common.—The manifold charms of Wimbledon Common are well known and fully appreciated by those who are acquainted with the south-west suburbs of London. With an area of 1,000 acres, it has a richly diversified surface, and affords the visitor an opportunity of enjoying natural scenery of great beauty. Not only is the common itself extremely beautiful, but the views obtained from the higher points extend over a wide expanse of country, and are for the most part of a delightful character. Appreciating the importance of maintaining as large an area of the land around the common as possible in its present condition, an endeavour is being made to raise the funds necessary for the purchase of 172 acres adjoining Wimbledon Common and Putney Heath. This addition to the magnificent open space prevents any serious impairment of the beauty of the general prospect or interference with any of the various features. A council of upwards of 200 members has been formed for raising the necessary funds, and the vice-presidents include Lord Eversley, Lord Meath, and Mrs. Barnett. Upwards of £50,000 will be required for the purchase of the land, and a sum of £1,500 has been privately subscribed locally. The hon. secretary is Mr. Richardson Evans, The Keir, Wimbledon Common.

Royal Agricultural Society.—At the monthly council meeting of this society the Duke of Devonshire read a letter from Sir Dighton Probyn to Mr. Fellowes, informing the council that the King had been pleased to accept the presidency of the society for the year 1911, when the show will be held at Norwich, in the county in which, the Duke reminded the council, the King's home had been for so many years. The society, he added, owed a deep debt of gratitude to the King for the very great interest he had always shown in the welfare of the society and the important industry which it represented.

Phytochemical Investigations at Kew.—In August last the late Dr. Greshoff, director of the Colonial Museum, Haarlem, who had for some years devoted special attention to phytochemistry, examined phytochemically in the Jodrell Laboratory at Kew a number of plants grown in the Royal Gardens. The results of his investigations are given in the most recent of the issues (No. 10, 1909) of the "Kew Bulletin," and to those who are in any way concerned with the constituents of plants the report will be most valuable. It has also a melancholy interest, for Dr. Greshoff died suddenly early in December last. The late Dr. Greshoff states in the introduction to his report that chemistry should be able to render considerable aid in botanical investigations, but can only give complete assistance to systematic botany, when it is used, not incidentally as a botanical aid, but when opportunity is offered in botanical surroundings for the independent chemical study of the general and special constituents of the plant. To show the practical importance of such study he directed attention to the fact that there is no other way of ascertaining whether new plants of economic value, including medicinal plants, which are introduced from foreign countries, deserve general attention than by subjecting them to analysis by performing their chemical evaluation. It therefore appeared clear to him that chemistry and botany should co-operate in the study of the plant world. A very large number of plants were investigated by the late Dr. Greshoff during the three weeks he was working at Kew, and the particulars of their constituents are of much interest and considerable practical importance.

Extensions at Wye College.—The governors of the South-Eastern Agricultural College, Wye, have resolved to considerably extend the college buildings this year, so as to afford increased accommodation for teaching and investigation, and provide more room for the increasing number of in-college students. It is hoped that the new buildings will be ready for use in October.

Pruning Fruit Trees was the subject of an interesting and instructive lecture given by Mr. T. B. Field, president of the East Anglian Horticultural Society, at the monthly meeting of the Ipswich Gardeners' Association. Both winter and summer pruning of the various kinds of fruit trees grown in gardens was fully dealt with, and much useful advice given.

Cardiff and County Horticultural Society.—This flourishing society came of age last year, and held a splendid show in the Sophia Gardens. This year another fine schedule has been arranged, and a great show is expected on July 20 and 21. Amateurs are liberally catered for, especially in the divisions for roses, carnations, sweet peas, and plants; the fruit and vegetable classes are chiefly open, and substantial prizes are offered by the society and the leading seedsmen. The secretary is Mr. A. Maurice Bailey, 24, Duke Street, Cardiff.

Longevity of Fern-spores.—An illustration of the longevity of fern-spores has occurred at Kew in the case of Cheilanthes mysurensis, Wall., specimens of which were collected in South China on October 28, 1899, and preserved as herbarium specimens. Spores taken from these and sown at Kew in March, 1908, have, it is recorded in the "Kew Bulletin," produced healthy plants, which now bear fully-developed fronds about 9in. long. The species grows in dry, rocky places at low elevations, and is distributed from Japan, Formosa, and Central China to Tonkin, Southern India, and Ceylon. When the fronds are dried without much pressure their margins incurve greatly, and serve as an additional protection to the spores.

Fruit Tree Management.—A leaflet issued by the Board of Agriculture gives some useful information on the manuring, pruning, regrafting, and replanting, operations which require attention during the earlier months of the year. In reference to the planting of young trees in the place of old, stress is laid upon the desirability of removing as completely as possible old roots, in order that no decaying wood may be left in the soil. A circular hole at least 6ft. in diameter, and from 1½ft. to 2½ft. deep should be dug and left open to atmospheric influences as long as possible before the tree is planted. The soil should also be sweetened and freed as far as possible from insect and fungoid pests by a dressing of quicklime, and if soil can be obtained to substitute for that dug out so much the better. It is also advised that in the case of orchards on grass land the soil round the roots of each tree should be dug regularly.

ROYAL HORTICULTURAL SOCIETY.

There is always a good show on the occasion of this society's annual meeting, but on Tuesday last there was scarcely so good a display as is usual on the anniversary day. Orchids, early hardy flowers, cyclamens, primulas, forced shrubs, carnations, apples, and vegetables were all well shown, and there was an interesting exhibition, but it was not quite up to first class.

FLORAL COMMITTEE.

A charming display of beautiful perpetual carnations was arranged by Mr. H. Burnett, Guernsey, who had delightful flowers of the new Mrs. Tatton, Marmion, Mrs. H. Burnett, Aristocrat, Winsor, White Perfection, Enchantress, Snow Queen, and a beautiful new yellow seedling flaked with light red—a startling and brilliant variety. A miniature rock garden display from Messrs. J. Cheal and Sons, Crawley, contained an assortment of saxifragas, sedums, hardy flowering heaths, Iris reticulata, primroses, hellebores, Rhododendron præcox, cydonias, and tulips.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, contributed a charming lot of carnation blooms, and batches of azaleas, heaths, daphnes, chorezemas, and fine cyclamens. Alpines were prettily shown among small rocks by Messrs. T. S. Ware, Lim., Feltham, who also brought up a good strain of Primula obconica, hellebores in variety, and saxifragas. The deep crimson carnation Carola was conspicuous and beautiful in the display of fine flowers submitted by Mr. C. Engelmann, of Saffron Walden; it is a fine variety. Mr. G. Reuthe, Keston, set up crocuses, irises, anemones, and handsome foliaged Himalayan rhododendrons.

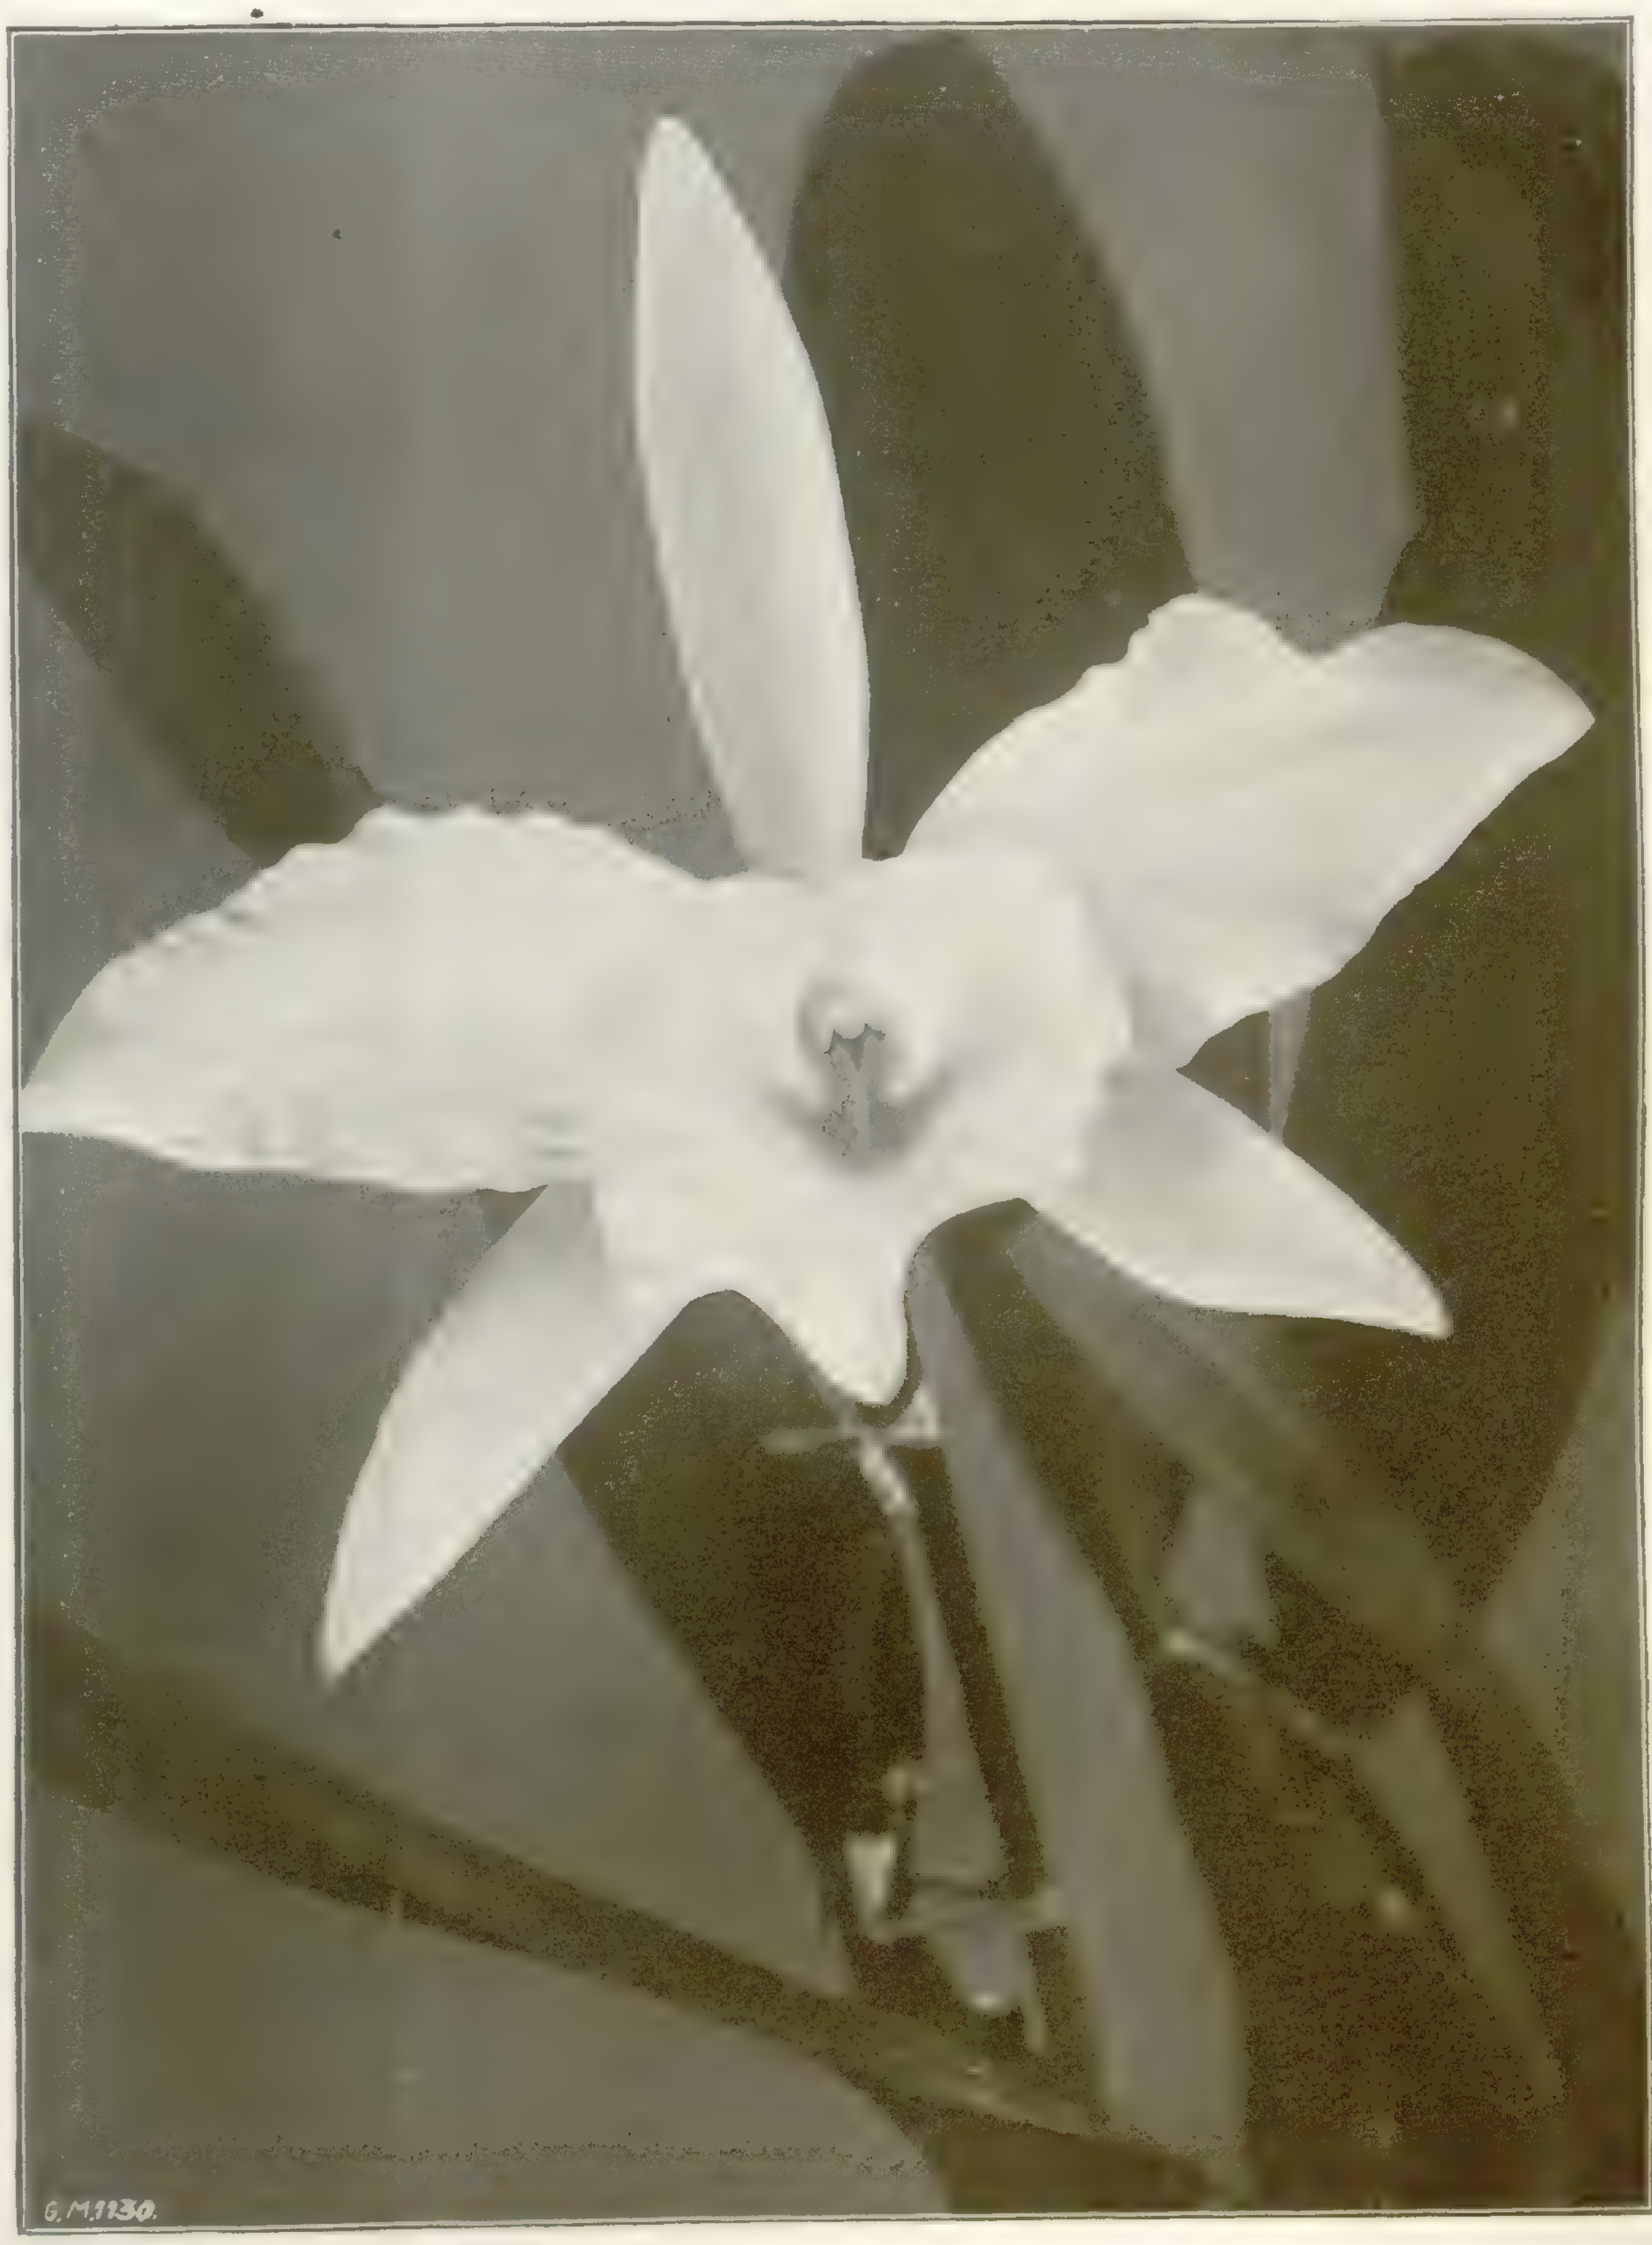
A beautiful display of flowering trees and shrubs was made across the end of the hall by Messrs. Jas. Veitch and Sons: beautifully flowered Indian azaleas, both standards and dwarfs, filled one end of the group; the centre was filled with forsythias, pyruses, rhododendrons, lilacs, cydonias, wistarias, and other lovely things. The same firm filled a table with grandly flowered dwarf azaleas, lily of the valley, Calceolaria Burbidgei, daphnes, and a grand strain of Primula obconica. Early spring flowers were prettily displayed by Messrs. Barr and Sons, Covent Garden, the most conspicuous being Iris reticulata, I. r. Krelagei, lachenalias, yellow freesias, choice crocuses, daphnes, snowdrops, narcissi, and hyacinths. Cyclamens in many shades of colour, plain, fringed, and papilio forms, were well shown by Messrs. Sutton and Sons, Reading.

A beautiful group of forced flowering shrubs was prettily arranged by Messrs. R. and G. Cuthbert, Southgate: it consisted chiefly of magnolias, forsythias, Pyrus atrosanguinea, Azalea mollis in variety, Prunus triloba, the fragrant Lilac Marie Lemoine, and Staphylea colchica; these were associated with palms and ferns, and made a fine feature of the show. Alpine plants and shrubs in variety came from Messrs. J. Peed and Son, West Norwood. Mr. Herbert Chapman, Rye, brought up new seedling freesias and hardy cyclamens. Messrs. Wm. Paul and Son, Waltham Cross, put up a very bright and interesting collection of camellias, both single and double varieties, new and old.

Mr W. Palmer, Andover, showed a double primula named Joe Chamberlain, the plants not yet at their best. Messrs. H. Cannell and Sons, Swanley, showed elegant and freely-flowered plants of their Star of Lady primulas, named Chameleon, White Lady, Mrs. H. Cannell, Scarlet Gem, Gloriosa, Blue Lady, and the deep red W. Raphael. The irises shown by Messrs. Wm. Cutbush and Son, Highgate, were greatly admired, the rich blue of I. reticulata and I. r. Krelagei appealing to everyone. The Highgate firm's exhibit of art carnations was admirably set up, and contained fine blooms of Winsor, Mrs. Burnett, Marmion, O. P. Bassett, Mrs. E. Gilman, and Aristocrat. Messrs. H. B. May and Sons, Edmonton, put up a very interesting collection of ferns, showing large examples of various davallias, acrostichums, polypodiums, platyceriums, and other epiphytal ferns; most of these were growing on blocks, pieces of tree fern, etc. At one end of the group was a batch of the lovely Nephrolepis Marshalli.

ORCHID COMMITTEE.

Mr. Alexander, orchid grower to Lient.-Colonel Holford, Westonbirt, Gloucester, brought up Cattleya Percivaliana Westonbirt var. (A.M.), very fine; the glorious, orange-coloured Lælio-cattleya Ariel superba, carrying a spike of seven lovely flowers; and Sophro-lælio-cattleya Danæ Holford's var. The pretty white Brasso-cattleya Wellesleyæ, derived from Cattleya Mossiæ Wagneri and Brassovola glauca, gained an A.M. for Mr. Francis Wellesley, Westfield, Woking. Mr. J. Collier, gardener to Sir J. Colman, Bart., Gatton Park, Reigate, showed a fine plant of Cymbidium grandiflorum (Cultural Commendation), Spathoglottis Colmaniæ, and several calanthes, Dendrobium Duchess of Albany (A.M.), and masdevallias. Mr. Bromilow, Rann Lea, Rainhill, submitted Cypripedium Leeanum Excelsior (A.M.), with very broad dorsal sepal. Messrs. J. and A. McBean, Cooksbridge, showed the beautiful Cymbidium Sanderæ, one spike carrying twenty flowers. Mr. Mertens, Ghent, again showed hybrid odontoglossums.



BRASSO-CATTLEYA WELLESLEYÆ.

A beautiful bigeneric hybrid with white flowers. A.M., R.H.S., February 8, Mr. F. Wellesley.

Messrs. James Veitch and Sons, Chelsea, displayed orchids finely, showing odontoglossums, cattleyas, and cypripediums, the latter being especially good, and including C. Little Gem, C. Euryades, C. Golden Glory, C. Elatior, C. insigne Veitch's var., C. Actæus, C. Lathamianum, C. Leeanum, etc. Odontoglossums, dendrobiums, and calanthes were well shown by Messrs. Stuart Low and Co., Bush Hill Park, Enfield; Oncidium cheerophorum, Lælio-cattleya Ophir, Dendrochilum glumaceum, Ærides vandarum, and white forms of Cattleya Percivaliana were also conspicuous in this exhibit. Mr. E. Rogerson, West Didsbury, brought up a few cypripediums, dendrobiums, and well-marked varieties of Odontoglossum crispum.

Messrs. J. Cypher and Sons, Cheltenham, again had a small and select set of cypripediums, some delightful calanthes, notably C. Bryan and the lovely Brasso-cattleya Digbyano Mossiæ. A large and bright display of orchids made by Messrs. Sander and Sons, St. Albans, contained lovely sprays of Phalænopsis Schilleriana, and odontoglossums, dendrobiums, calanthes, and cypripediums, and several lælio-cattleyas. An attractive group of orchids from Messrs. Charlesworth and Co., Haywards Heath, contained a beautful lot of odontoglossums, including the new O. Sylvia, Odontioda Keighleyensis with deep blood-red flowers; Miltonia Bleuana nobilior, Dendrobium Deari, and the lovely little Sophronitis grandiflora.

Mr. E. V. Low, Vale Bridge, Haywards Heath, showed some very beautiful cypripediums, notably light-coloured forms of C. Actæus and C. aureum, as well as the beautiful Cymbidium Wiganianum and some lælio-cattleyas.

FRUIT AND VEGETABLE COMMITTEE.

Messrs. Dobbie and Co., Rothesay, contributed a large and very striking exhibit of finely-selected potatoes, each variety being shown in a basket of considerable size. There were about forty varieties, all in splendid condition, and including such fine things as The Provost, King Edward VII., The Factor, Midlothian Early, White City, Purple Eyes, Eightyfold, Dobbies' Favourite, Talisman, Adirondack, etc. The display was well arranged, very interesting, and greatly admired.

A bright group of well-preserved apples from Messrs. George Bunyard and Co., Maidstone, attracted a great deal of attention. All the varieties were staged in dishes of ordinary size, from six to twelve fruits of each. A few of the leading sorts were Hambledon deux Ans, May Queen, Beauty of Kent, Ontario, King Edward VII., Emperor Alexander, Winter Ribston, King of Tompkins County, Newton Wonder, Lane's Prince Albert, Cox's Pomona, Tyler's Kernel, Foster's Seedling, and Baumann's Red Winter Reinette.

Mr. Gentle, gardener to Mrs. Denison, Little Gaddesdon, brought up over fifty dishes of handsome potatoes, every tuber in excellent condition, and the varieties Duke of York, First Crop, Advancer, Schoolmaster, Goldfinder, Snowball, Monarch, Satisfaction, and King Edward VII., were especially good. Mr. Gentle also showed splendid onions, globe and long beet, turnips, carrots, and parsnips. Mr. R. Staward, gardener to Lady Cowper, Panshanger, showed whole plants of several varieties of Brussels sprouts, and the best in cropping and appearance were Liberton Selected, Sutton's Matchless, and Solidity.

A very interesting group of oranges in tubs and pots from Messrs. T. Rivers and Son, Sawbridgeworth, attracted a great deal of attention, the handsome golden fruits nestling amid rich green foliage providing a fine display. Tangerine, Malta Egg, Sustain, Navel, and the new dwarf Japanese Satsuma varieties were very prominent, two plants of the first-named carrying sixty fruits each. The citrons were also very fine. A splendid exhibit of leeks and onions was made by Messrs. Sutton and Sons, Reading; the onions were fine bulbs, solid, and well kept, Ailsa Craig and Improved Reading figuring prominently; Prizetaker and Royal Favourite leeks were in fine form.

AWARDS OF MERIT.

To Crinum purpurascens, from Sir Trevor Lawrence, Bart. (gardener, Mr. Bain), Burford Lodge, Dorking; to Cattleya Percivaliana Westonbirt var., from Lieut.-Col. Holford, Westonbirt, Gloucester; to Dendrobium Duchess of Albany, from Sir Jeremiah Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate; and to Brasso-catleya Wellesleyæ, from F. Wellesley, Esq. (gardener, Mr. W. Hopkins), Westfield, Woking.

MEDALS.

Silver Gilt Flora.—To Messrs. J. Veitch and Sons, Chelsea, for shrubs and plants; and one for orchids; to Messrs. H. B. May and Sons, Edmonton, for ferns; to Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Silver Gilt Knightian.—To Mr. A. Gentle, gardener to Mrs. Denison, Little Gaddesdon, for vegetables; to Messrs. G. Bunyard and Co., Maidstone, for apples.

Silver Gilt Banksian.—To Messrs. Dobbie and Co., Rothesay, for potatoes; to Messrs. R. and G. Cuthbert, Southgate, for forced flowering shrubs.

Silver Flora.—Mr. H Burnett, Guernsey, for carnations; to Messrs. Stuart Low and Co., Enfield, for cyclamens and carnations; and one for orchids; Messrs. Sander and Sons, St. Albans, for orchids; Messrs. Cypher and Sons, for orchids; Messrs. W. Paul and Son, Waltham Cross, for camellias.

Silver Knightian.—To Messrs. T. Rivers and Son, Sawbridgeworth, for oranges.

Silver Banksian.—To Messrs. Sutton and Sons, Reading, for onions and leeks; to Messrs. J. Cheal and Sons, for alpines, etc.; to Messrs. W. Cutbush and Son, Highgate, for carnations, etc.; to Mr. C. Engelmann, Saffron Walden, for carnations; to Mr. E. Reuthe, Keston, for shrubs and flowers; to Mr. Rogerson, Didsbury, for orchids; to Mr. E. V. Low, Vale Bridge, Haywards Heath, for orchids.

Bronze Flora. — To Mr. L. R. Russell, Richmond, for shrubs.

ANNUAL MEETING.

There was an excellent attendance at the annual meeting, held at three o'clock in the Lecture Hall, under the chairmanship of the President, Sir Trevor Lawrence, Bart., who was supported by most of the members of council.

The usual formalities were observed, and 65 new Fellows were elected, and then the President rose to move the adoption of the report and balance-sheet as already circulated and published in our columns last week. Sir Trevor congratulated the Fellows on the continued prosperity of the society, and briefly referred to the work at Wisley, the new portraits of Baron Schroder and Mr. Harry J. Veitch in the Council Room, the effort to bring Pritzel's Icones Botanicarum up to date, the new arrangements for the conduct of the Lindley Library, the Holland House show of 1910, and the proposed summer show at Olympia in 1911, the proposed International Show of 1912, and other items of interest. Mr. J. Gurney Fowler, the treasurer, seconded the motion, and very lucidly compared income and expenditure with that of previous years. He said there were several trust funds in connection with the society, and he hoped to show the accounts of each separately another year. He pointed out that all possible expenditure on upkeep and improvements of the hall were placed to current and not to capital account, and that £150 was being set aside for three years to meet the expense of repainting the buildings in 1912. Since January 1, 1910, he had invested £10,000, bringing investments to £50,000.

Mr. A. W. Sutton, V.M.H., congratulated the Council on its able management of affairs. Mr. Elwes did the same, and expressed his pleasure at finding over £200 had been spent on books for the library, but he wanted to know exactly what the new arrangements pending between the Lindley Trustees and the Charity Commissioners would mean, and said he understood Pritzel's Icones Botanicarum had been brought up to date, and that typed copies of new matter since the publication of the book were at Kew and in the hands of Mr. Godman and Miss Willmott, and this being so, he thought the supplement might be printed at a far less cost than £3,000—the sum regarded as necessary for republication. The Rev. J. Jacob expressed his appreciation of the additions to the library, and suggested that one or more persons should be appointed to look out for and purchase rare horticultural works as these came into the market.

Sir Trevor replied to the several points raised, and said that the council proposed to hold very cordial relations with the authorities at the Japanese Exhibition at Shepherd's Bush this year, where Japanese horticulture would be largely represented. He also said the R.B.S. had not made proposals the R.H.S. could discuss. The Rev. W. Wilks pointed out that the revision, correction, and republication of Pritzel's Icones was not abandoned, but only in abeyance, because at present the American Universities had not come forward with the financial help expected. Col. Prain had said that £3,000 was necessary for a thorough revision and correction of the work, and towards that sum the Council were prepared to give £250 per year for three years. The typed supplements referred to by Mr. Elwes were neither correct nor complete. Mr. J. Gurney Fowler said that if the arrangements now in progress were carried through, the Lindley Trustees as such would disappear, and the library would be vested in the R.H.S. in perpetuity, but in such a way that the books could not be used in any way as a realisable asset. The Charity Commissioners would keep a fatherly eye on the Lindley Trust funds. The motion was then put and carried.

The Veitch Memorial Medal was then presented to Mr. W. White, orchid grower to Sir Trevor Lawrence, Bart.; but Mr. W. Botting Hemsley, F.R.S., late of Kew, and Mr. H. J. Chapman, of Oakfield, Wylam-on-Tyne, gardener to Mrs. Norman Cookson, were not able to be present to receive their medals. The Victoria Medal of Honour in Horticulture was then presented to Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston; and to Mr. A. Mackellar, the King's head gardener at Windsor; but Mr. J. McIndoe was ill, and could not be present to receive this coveted honour.

The proceedings closed with a vote of thanks to the President.

THE MOST POPULAR SWEET PEAS.

We publish the following from the "Sweet Pea Annual" by the courtesy of the Committee of the National Sweet Pea Society:—

Since the inception of the National Sweet Pea Society the committee has invariably held steadfastly to the view that the general bulk of the members should yearly contribute something of real value to the pages of the society's annual. For several successive seasons papers were issued upon which the recipients were invited to reply to questions on practical cultural subjects, and there can be no doubt that the reliable information thus gathered together has been of the utmost value to thousands of growers abroad, as well as in our own country.

In the early summer of 1909 it was decided, after much discussion, to invite members to participate in a great election with a view to ascertaining which were the most popular varieties in general cultivation. No fewer than 156 papers were most carefully filled in by members of the society and returned to the hon. secretary. Hereunder are the tabulated returns showing the precise position of each variety that received three or more votes. It is clearly demonstrated that certain varieties thrive admirably under practically all conditions, or there would not be such an overwhelming consensus of opinion in their favour, and those who are inexperienced might do far worse than make their selections from the list, choosing, of course, those which meet their individual tastes in respect of colour.

FLOWERING CURRANTS.

There is possibly no more familiar shrub found in old-fashioned gardens than the ordinary form of Ribes sanguineum, which is popularly called the "flowering currant," and were a census of the best-flowering shrubs taken, it is quite probable that it would take a high place in the list, for notwithstanding the fact that a large number of very choice and beautiful shrubs have been introduced since this plant came on the scene, there are few which prove more floriferous and showy, or are of easier cultivation.

Though many species of Ribes belonging to the currant group of the genus are known to science, the best, from a floral standpoint, are included in the two species, R. sanguineum and R. aureum. The garden currants, which are grown for their fruit, make no pretence of beauty where the flowers are concerned. Hybrids have been raised between these and the ornamental-flowered kinds, but so far the efforts to combine showy flowers and palatable fruit have been failures.

RIBES SANGUINEUM ALBIDUM. [Photo: C. P. Raffil.

A free-blooming and attractive variety with white flowers.

The flowering currants possess one great advantage over many of our choicer shrubs in that they may be grown practically all over the country, and by anybody, for they are as hardy as a sloe and as easy to grow as a blackberry. Any ordinary garden soil suits them, and they may be grown for many years with practically no attention. When they become overgrown they may be thinned out well, cut back, or thrown away, for nobody minds getting rid of a plant that can be so easily replaced as a flowering currant. Cuttings of ripened shoots a foot long, taken in October or November, and inserted in a shady border in a similar manner to ordinary gooseberry or currant cuttings, may be expected to root during the following spring, and in the course of the summer form plants large enough to put out in permanent places if it is so wished. A second year in nursery quarters however results in a thorough good foundation being laid for the future plant. Though the majority of the different varieties of the two species previously alluded to are of good constitution, the subject of the accompanying illustration exhibits a share of the weakness which is apparent in many albinos, as it has a peculiar habit of suddenly going wrong when, to all intents and purposes, in full vigour, and there is little or nothing to show the cause, therefore it is advisable to root a few cuttings each year to keep a stock in hand.

In addition to the flowering currants being valuable assets for the shrubbery, they may also be used for forcing, though they do not appear to be grown very largely for that purpose. Forced in a moderate amount of heat, however, they open well, and give a very good account of themselves.

Ribes sanguineum is found in California and other parts of Western North America, and is said to have been introduced to British gardens about 1826. It is well known as a large bush, four to six feet high, which blossoms profusely from March to May, according to the earliness or lateness of the district in which it is grown. Its drooping racemes of red flowers are too well known to require description, whilst its bluish-black fruits are equally familiar objects. Like many other widely-grown plants, a number of distinct forms have originated, which have been given varietal names. These differ chiefly in the colour of the flowers, some having richer blossoms than those of the type, whilst others have paler. Some of the best of these varieties are as follows: R. s. albidum, with pale, almost white blooms (see illustration); atrorubens, with very rich, deep red flowers; atrosanguineum, darker than the type; carneum, paler than the type; flore pleno, with double flowers; and malvaceum, with rather larger and more hairy leaves, and shorter and denser inflorescences than R. sanguineum.

R. aureum is variously known as the golden currant, buffalo currant, and Missouri currant. It is also a native of Western North America, and forms a bush four to eight feet high. It differs from the former in its shiny, hairless leaves and rich golden flowers, which are very fragrant. The fruits are usually golden in colour, but sometimes black, or almost so. Like the former plant, it possesses a number of varieties, some of which are more ornamental than the type. The best is R. a. aurantiacum. It is dwarfer and more compact than the type, and an extremely free flowerer. R. a. præcox blossoms earlier than the other forms, and flowers sometimes open early in March, the ordinary flowering time being April and May.

R. Gordonianum is a hybrid between the two above-mentioned species. It is a strong-growing bush, and the flowers combine the red and yellow in a curious manner. It cannot be said to be an improvement on either parent, however. R. bracteosum, also a Western North American shrub, is worth growing for the sake of its long pendulous racemes of small, yellowish-brown flowers, which open in May. It forms a good-sized shrub, and is wonderfully distinct from any other species.

Kew. W. Dallimore.

TEN WEEK STOCKS AS BEDDING PLANTS.

These delightfully fragrant plants have come to the front in recent years, and are now extensively employed for bedding purposes. The change that has taken place in the system of bedding out is responsible for their extended use. Under liberal culture and management ten-week stocks afford a splendid display over many weeks, and, on the other hand, if grown in light, porous soil, and they receive but scant attention in the shape of watering in times of drought, their life is a short one.

Over many years I have raised upwards of eight thousand plants annually for garden decoration, and I purpose offering a few remarks as to the method pursued. It is quite true that fairly good results can be had by sowing the seeds direct in the open garden, but, as far as my experience goes, the plants are not to be compared with those that are raised in frames at an earlier date.

The middle of March is soon enough to make sowings, and the best plan is to employ shallow boxes filled with light sandy soil, and, when placed in a gentle hotbed, rapid germination and subsequent growth result. A very important point is to ensure continuous growth, otherwise premature flowering will occur, and, in view of the fact that stocks are impatient of root disturbance, steps should be taken to prevent any serious check when they are placed in permanent quarters. The labour involved in placing the whole stock of plants into small pots will be well repaid, but I would advise that they be first grown into large sturdy plants in the boxes before being potted.

If pricked off at four inches apart when a couple of true leaves have been formed, and the plants are sprayed overhead in the early afternoon on closing the frames, good sturdy specimens will result in the course of a month, when they should be potted, and kept close for a few days. It only remains to admit air gradually, and at the end of a week or so to transfer to cold frames for the final hardening off process.

With respect to soil, the best results are obtained in fairly tenacious loam, to which a fair quantity of lime or builder's rubble has been incorporated, and if a good mulch of short manure is applied after a considerable amount of growth has been made, their season of beauty will be appreciably lengthened thereby. It will occur to the cultivator to thoroughly saturate the soil from time to time if drought prevails, and much good will be done if the plants are watered overhead, either through a rosed can or hose every evening for two or three weeks after being planted out. Further, in addition to the ground being liberally manured and mulched, an occasional dressing of some fertiliser may be given with advantage.

A word may be said as to the importance of procuring the seeds from a reliable source, and a firm who have a reputation to maintain. Specially saved seeds usually produce about 90 per cent. of double-flowered plants, while cheap imported seeds are scarcely worth attention. Several named kinds are very fine, amongst which Monarch is a great beauty. It throws up a single spike, which attains to eighteen inches, and sometimes two feet high, enormous white flowers being formed over the whole length. It is admirably adapted for large beds, also for bold groups or colonies in the borders. Mont Blanc and Princess Alice are also good white varieties of great purity, and the last-named has the merit of being a continuous bloomer. Triumph and Vulcan are altogether first rate in crimson, and a bluish shade respectively. The Dwarf Large-flowered can be relied upon to produce a great wealth of inflorescence and charming display, and the same applies to the Giant Branching section, which is certainly more effectively beautiful than any other section.

Walter H. Aggett.

THE INFLUENCE OF THE GARDEN.

The influence of gardens upon individuals and upon nations is incalculable, and probably the garden will never be appraised at its full value in the highest sense. Gardens have exercised an untold power in the civilising of nations, and it would be folly even at the present day to underrate the influence of the garden as a means of uplifting the moral tone of a community.

The love of flowers and trees, the appreciation of natural beauty in its many phases, will have nothing but a good effect upon the individual, and he who delves deepest into the beauties of Nature, and whose eyes are trained to define its charms, is the man who is going to obtain untold good, and abundant pleasure out of life. It has been aptly said that "Art is the expression of the soul," and, this being so, the garden makers' art is lifted to a very high plane indeed, and fully justifies the assertion that the successful maker of gardens is an artist indeed.

From the first bursting buds of spring to the glorious hues of the autumn the garden is an endless panorama of changing glories, and may be regarded as an important factor, to interest and to inspire the human race.

A really satisfactory garden is the one that combines natural beauty with harmony of arrangement. It must give pleasure to the beholder, and must ever be a restful retreat, wherein there is an absence of jarring incongruities, and one can find rest and repose. In a word, the true garden will be restful to the eye, and at the same time of great interest and perfect beauty. Small gardens may ofttimes possess these attributes, and sometimes large expensive ones will be found entirely lacking in that respect. Gardens which look as if they were constructed piecemeal, each portion, seemingly the product of a different scheme, and entirely lacking in harmony with one another, are inartistic and badly arranged.

When one bears in mind the fact that the flower gardens or pleasure grounds are places set apart for the display of floral beauty, to provide a calm and restful retreat where one can forget for a time the storm and stress of everyday life, and to furnish a pleasing setting for the dwelling-house, it will be realised that in addition to cultural proficiency, one also needs something of the artist's skill in the arrangement of the garden scheme.

A garden which fails to be to its owner of perennial interest must generally be regarded as lacking in attraction, though this need not infer that the garden in question is a neglected one. On the contrary, it may be exceedingly well kept, and stocked with beautiful plants, shrubs, etc., which possibly provide a blaze of colour at all seasons when flowers are possible. The fault may be simple, it may be an artificial note is struck, which puts harmony of arrangement out of the question; it may be that in striving after glowing effects, the whole picture becomes crude, gaudy, and overdone, but, whatever the fault may be, the garden is robbed of the exquisite charm it ought to possess, and deprived of half of its interest.

But the garden to which one can turn in the hour of gloom or weariness and find in its serenity and harmonious beauty just the inspiration, and the interest which leads one to forget self and the jarring notes of a worrying world, is the garden which has realised its mission. Here, with the mind and soul at rest, and the vision delighting in the beauties of the blossoms, and the hearing gladdened by the song of birds, and the hum of busy insect life, where one can find new interests and restful calm at every visit, one can enjoy to the full the pleasures of the garden. Usually the most charming gardens are those where employer and gardener are one in their desires to enhance its interest and beauty, and if the owner fails to find any interest in his own garden, there is no wonder that his employees often slacken in their endeavours.

In conclusion, let me advocate a note of originality in garden decoration. The artist must, if he desire great success, be original in his art. He must renounce the idea of being a mere copyist, and use his own eyes and brains to see the beautiful in Nature, and to mould his visions and ideas in a concrete original form. His picture, whether it be upon canvas or in the garden, should embody the results of his own study, observation, and love of beauty, and not be a copy of another's work in a different place. In following this idea one can understand why Japanese gardens are so uniformly pleasing. The Japanese garden maker is an artist in every case, an artist born, if you like, but improved by training himself to look upon his work with an artist's eye. Every detail is carefully studied with a view to after effect, every rock, every tree, every plant must be in keeping with the idea in his mind. The garden may not be a flower garden, as we know it, but it is beautiful in its finish, it is of great interest for it presents new features at every turn. Full use is made of every bit of ground in the endeavour to add to the charm of the scene, and to give a maximum impression as to its extent, and, when finished, it would be no easy task to find even the smallest detail out of place.

Art awakens art, and the influence of garden artistry is an immense power for good, that is why garden cities and well-arranged public parks can be reckoned as immensely beneficial to the town worker and town dweller.

P. S. Hayward.

Rose William Allen Richardson under Glass.—I think this is one of the most satisfactory roses we can grow in the cool greenhouse. Like Maréchal Niel, it enjoys a little protection, although a much hardier rose on the whole. Under glass we avoid the pinched and badly-formed buds found early in the season when growing upon walls, while there is no variety more certain in flowering than this. It also lasts well both on and off the plant, and is very decorative in all its stages of opening. By thinning out some of the wood that has flowered, especially the longer growths, and making room for more of the long new growths a good succession is obtained. But I would not prune quite so severely as with the Maréchal Niel. As a coat flower it is hard to beat, and we usually obtain a deeper shade of orange-yellow when growing it under cover. For the average greenhouse I think it is generally more successful than Maréchal Niel; but no yellow can surpass the latter when it does well.—A. P.

TWERTON HILL NURSERY BATH.

APPLES FOR ORCHARDS.

The article on this subject by "H." (p. 65), is interesting, practical, and useful to intending planters. Standard-grown trees are affected less by neglect in management (pruning, for example) than any other form of training. For instance, a tree of Bramley's Seedling, owing to its natural tendency to spread outwards in a semi-weeping manner, will be less injured by a dozen years of neglected pruning than any other variety. I am certain if planters would keep the grass away from the stem of the tree for even a yard around much greater progress would be made during the first five years.

No one can give a universal list of suitable varieties; some sorts succeed in one county that are complete failures in another, not only in production, but as selling varieties. The only correct method of selection is by observation or experience.

"H." takes exception to Lane's Prince Albert as a standard on account of its poor growth; well, within fifteen miles of where I write I know of hundreds of half-standard trees of this variety that grow amazingly, and produce prodigious crops of very fine fruit. I presume there is no difference in standard or half-standard trees of the same variety in regard to the bearing propensity? In the case in point half-standards were planted owing to the situation being windswept. Vigorous growth is obtained by repeated manurings.

Now, with regard to the selection of varieties generally by "H.," Ecklinville Seedling is, in my neighbourhood, the worst variety we have. Some years ago, on the advice of an expert, I planted 250 trees, standards and bushes; all have been failures, not only in growth, but in cropping, plenty of small, ill-shapen, cracked fruit, as a rule, and even in a favourable season, when we did have a full crop of large fruit, this was the worst of all early apples to dispose of. Fruiterers say the skin is too soft, and the fruits will not bear handling, and thus the price is low. I have been told Ecklinville succeeds well in some districts. I find it makes an excellent stock for regrafting, both bush and the standard, as any variety grows well upon it. I have regrafted every tree of this variety, and those put on are growing capitally. Grenadier and Lord Grosvenor are the best September apples in this part: Gascoigne's Scarlet is too shy in bearing to recommend largely; Warner's King appears to be exhausted, not only here, but in Kent, where it formerly was such a success; Bismarck does not sell readily, and there is something about its flavour that is objectionable; Annie Elizabeth, Newton Wonder, and, above all, Bramley's Seedling, are fine favourites. The latter I regard as the finest of all varieties as an orchard standard. Norfolk Beauty must be added as an October apple, as it has all the merits of a desirable variety, and will largely take the place of Warner's King. Too many varieties are a mistake. It is much better to plant a dozen trees of a variety that does succeed, as it is quantity of suitable fruit, not a huge number of sorts, that pays. Trade purchasers like a quantity of that which sells well.

Amongst dessert apples Devonshire Quarrenden is still a favourite, coming in early and selling well; as a standard it grows satisfactorily, with occasional assistance from manure when young. Beauty of Bath is quite desirable, and very free in growth, and by allowing it to grow away freely it soon comes into bearing. The fruit sells easily at best prices. If Worcester Pearmain does not grow vigorously it grows sufficiently to warrant its inclusion as a standard. I look upon it as quite the best market variety we have in this neighbourhood. Allington Pippin has no market value here. Where Cox's Orange Pippin does succeed it would be advisable to plant none other, as nothing can touch it for freedom of crop, as well as quality; it is the favourite with all classes, but where the soil is heavy and retentive of moisture, and consequently cold, it is useless to plant this variety. Blenheim Pippin should be planted, and in numbers too; I used to think it was slow in coming into bearing, but that is not so. Make it grow freely at the start, thin the branches only, and allow it to grow at will in other respects, and good crops will be obtainable in a few years; keep cutting it back, and no crop is the result.

E. Molyneux.

Celery.—During the middle of the present month the first sowing should be made. Sow the seeds very thinly in six-inch pots, using finely-sifted light sandy soil. When sown, place the pots in a structure with a temperature of 55 deg., covering the seed pots with a sheet of glass till germination takes place. The chief point to bear in mind, and practice is to avoid a check to the growth, especially in the seed pots. Therefore, dryness at the root and overcrowding must be guarded against, or the majority will eventually run to seed. Superb White, Superb Pink, and Standard Bearer are three most reliable varieties, whether for home use or exhibition purposes.—G. E.

GESNERA ROYAL ORANGE.

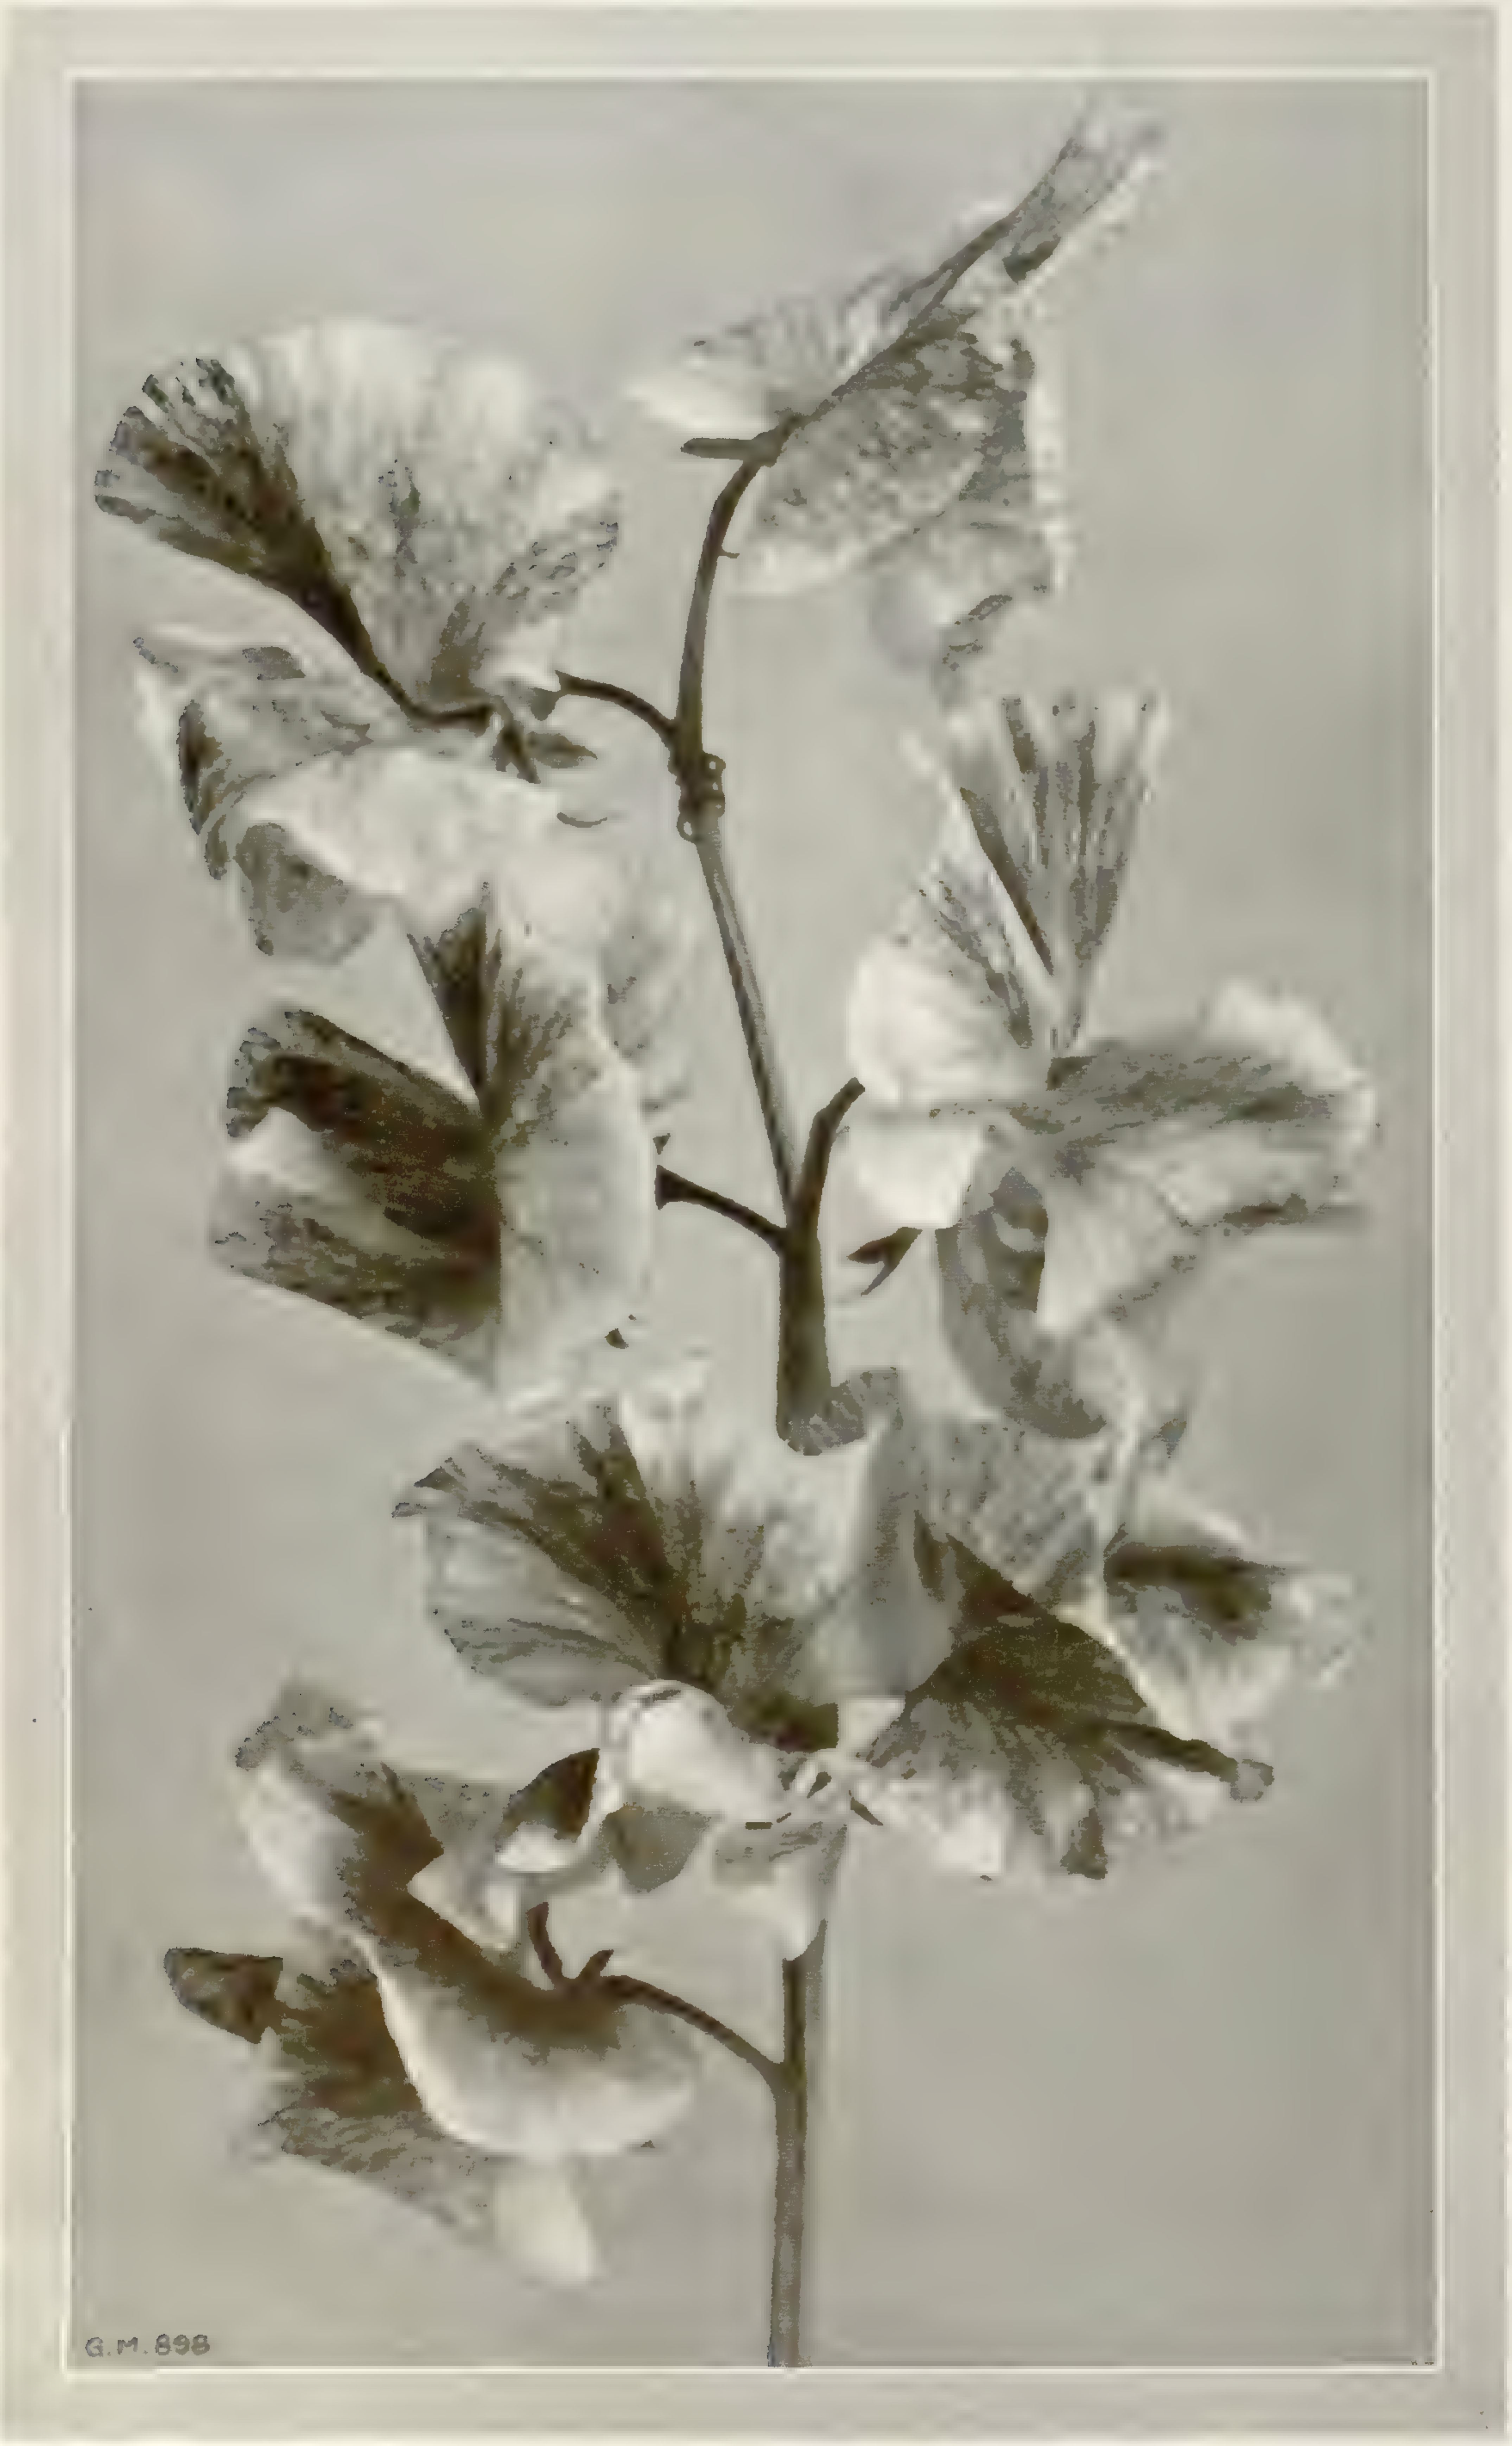
At one of the meetings of the Royal Horticultural Society, held a little while before last Christmas, a group of gesneras carrying very brilliant flowers was exhibited by Mr. J. Dickson, gardener to Adeline, Duchess of Bedford, Woodside, Chenies, Rickmansworth. The plants were so well grown and the flowers so brilliant that they attracted a great deal of attention, and there was considerable speculation as to the origin of the variety. It appears that the plants resulted from crossing Gesnera exoniensis with G. cinnabarina, and the name of Royal Orange has been given.

GESNERA ROYAL ORANGE.
An effective variety, with brilliant orange-coloured flowers.

Mr. Dickson points out that Royal Orange is better than either of its parents, and gives a new colour. In the culture of gesneras he starts the tubers in gentle heat about the end of May, placing them in boxes near the glass. As soon as growth commences they are potted singly into small pots, and presently given a shift into five-inch pots. During the summer a cold frame provides the necessary protection, and shelter from hot sunshine is afforded. The plants exhibited, one of which is herewith illustrated, were kept in a cold frame until September, and then put in a house with a temperature of from 50 to 55 degrees. Under stove treatment Gesnera Royal Orange becomes leggy, and the flowers do not produce the brilliant orange colouring that characterises them under the cooler conditions.

THE BUTCHER'S BROOMS.

At one time those members of the genus Ruscus cultivated in gardens were considered to be five in number, but two of them are now taken therefrom and assigned to other genera. By far the best known is the common Butcher's Broom (Ruscus aculeatus), which forms a dense mass of much-branched stems, reaching a height of a couple of feet or a little more. To the uninitiated it is somewhat of a puzzle, as the little greenish flowers, borne in spring, appear to be produced from the centre of the leaves, but in reality these last are what are botanically termed cladodes, that is, flattened branches rather than leaves proper. A parallel example occurs in some of the Australian acacias.



SWEET PEA YANKEE (OR MRS. WILCOX).
Flowers waved, whitish ground, shaded and striped with bright crimson.

The berries of the butcher's broom are about the size of large peas, and bright red when ripe. When laden with fruit it is decidedly ornamental, but it is mostly seen in a fruitless condition. This often arises from the fact that the male and female flowers are borne on different individuals, and that it is necessary to bring the two in close contact in order to have berries. A valuable feature of the butcher's broom is that it will grow under the shade of trees better than most shrubs, and, on this account, it is often employed for clothing spots where little else will thrive. For this purpose the deep descending nature of its roots stands it in good stead.

Another species is Ruscus hypophyllum, which is of much dwarfer stature than the preceding. The cladodes, too, are larger, and, as in the case of the common kind, the flowers are borne on the undersides. This species is a native of the South of Europe, and is said to have been introduced in 1683.

Ruscus hypoglossum, much like the preceding, is remarkable from the fact that the flowers are borne on the upper surface of the cladodes, and are accompanied by a small cladode springing from the centre of the larger one.

The Alexandrian Laurel (Danæ laurus) was formerly included with the butcher's brooms under the name of Ruscus racemosus, and as such it is still generally known in gardens. It forms altogether a more elegant shrub than the preceding, and in general appearance very much suggests some of the dwarfer bamboos, with which it is well worthy of association. The stems, which reach a height of a yard or even more, are clothed with narrow, pointed, glossy leaves or cladodes, which are fresh and bright at all seasons. These stems, clothed with their pleasing greenery, are very useful in a cut state for association with cut flowers in large vases, and for similar purposes, as they retain their freshness for a considerable time.

Semele androgyna is the name of the plant formerly known as Ruscus androgynus. It is a native of Madeira and the Canary Islands, and needs greenhouse protection in most parts of the country. It is an exceedingly vigorous grower, so that a very large structure is necessary, such, for instance, as the Temperate House at Kew and the Crystal Palace, in both of which places it is grown. The stout shoots will mount up thirty feet or so in a season, and the arrangement of the branches and cladodes give them the appearance of being clothed with long pinnate deep green leaves of a leathery texture.

W. T.

SWEET PEA YANKEE.

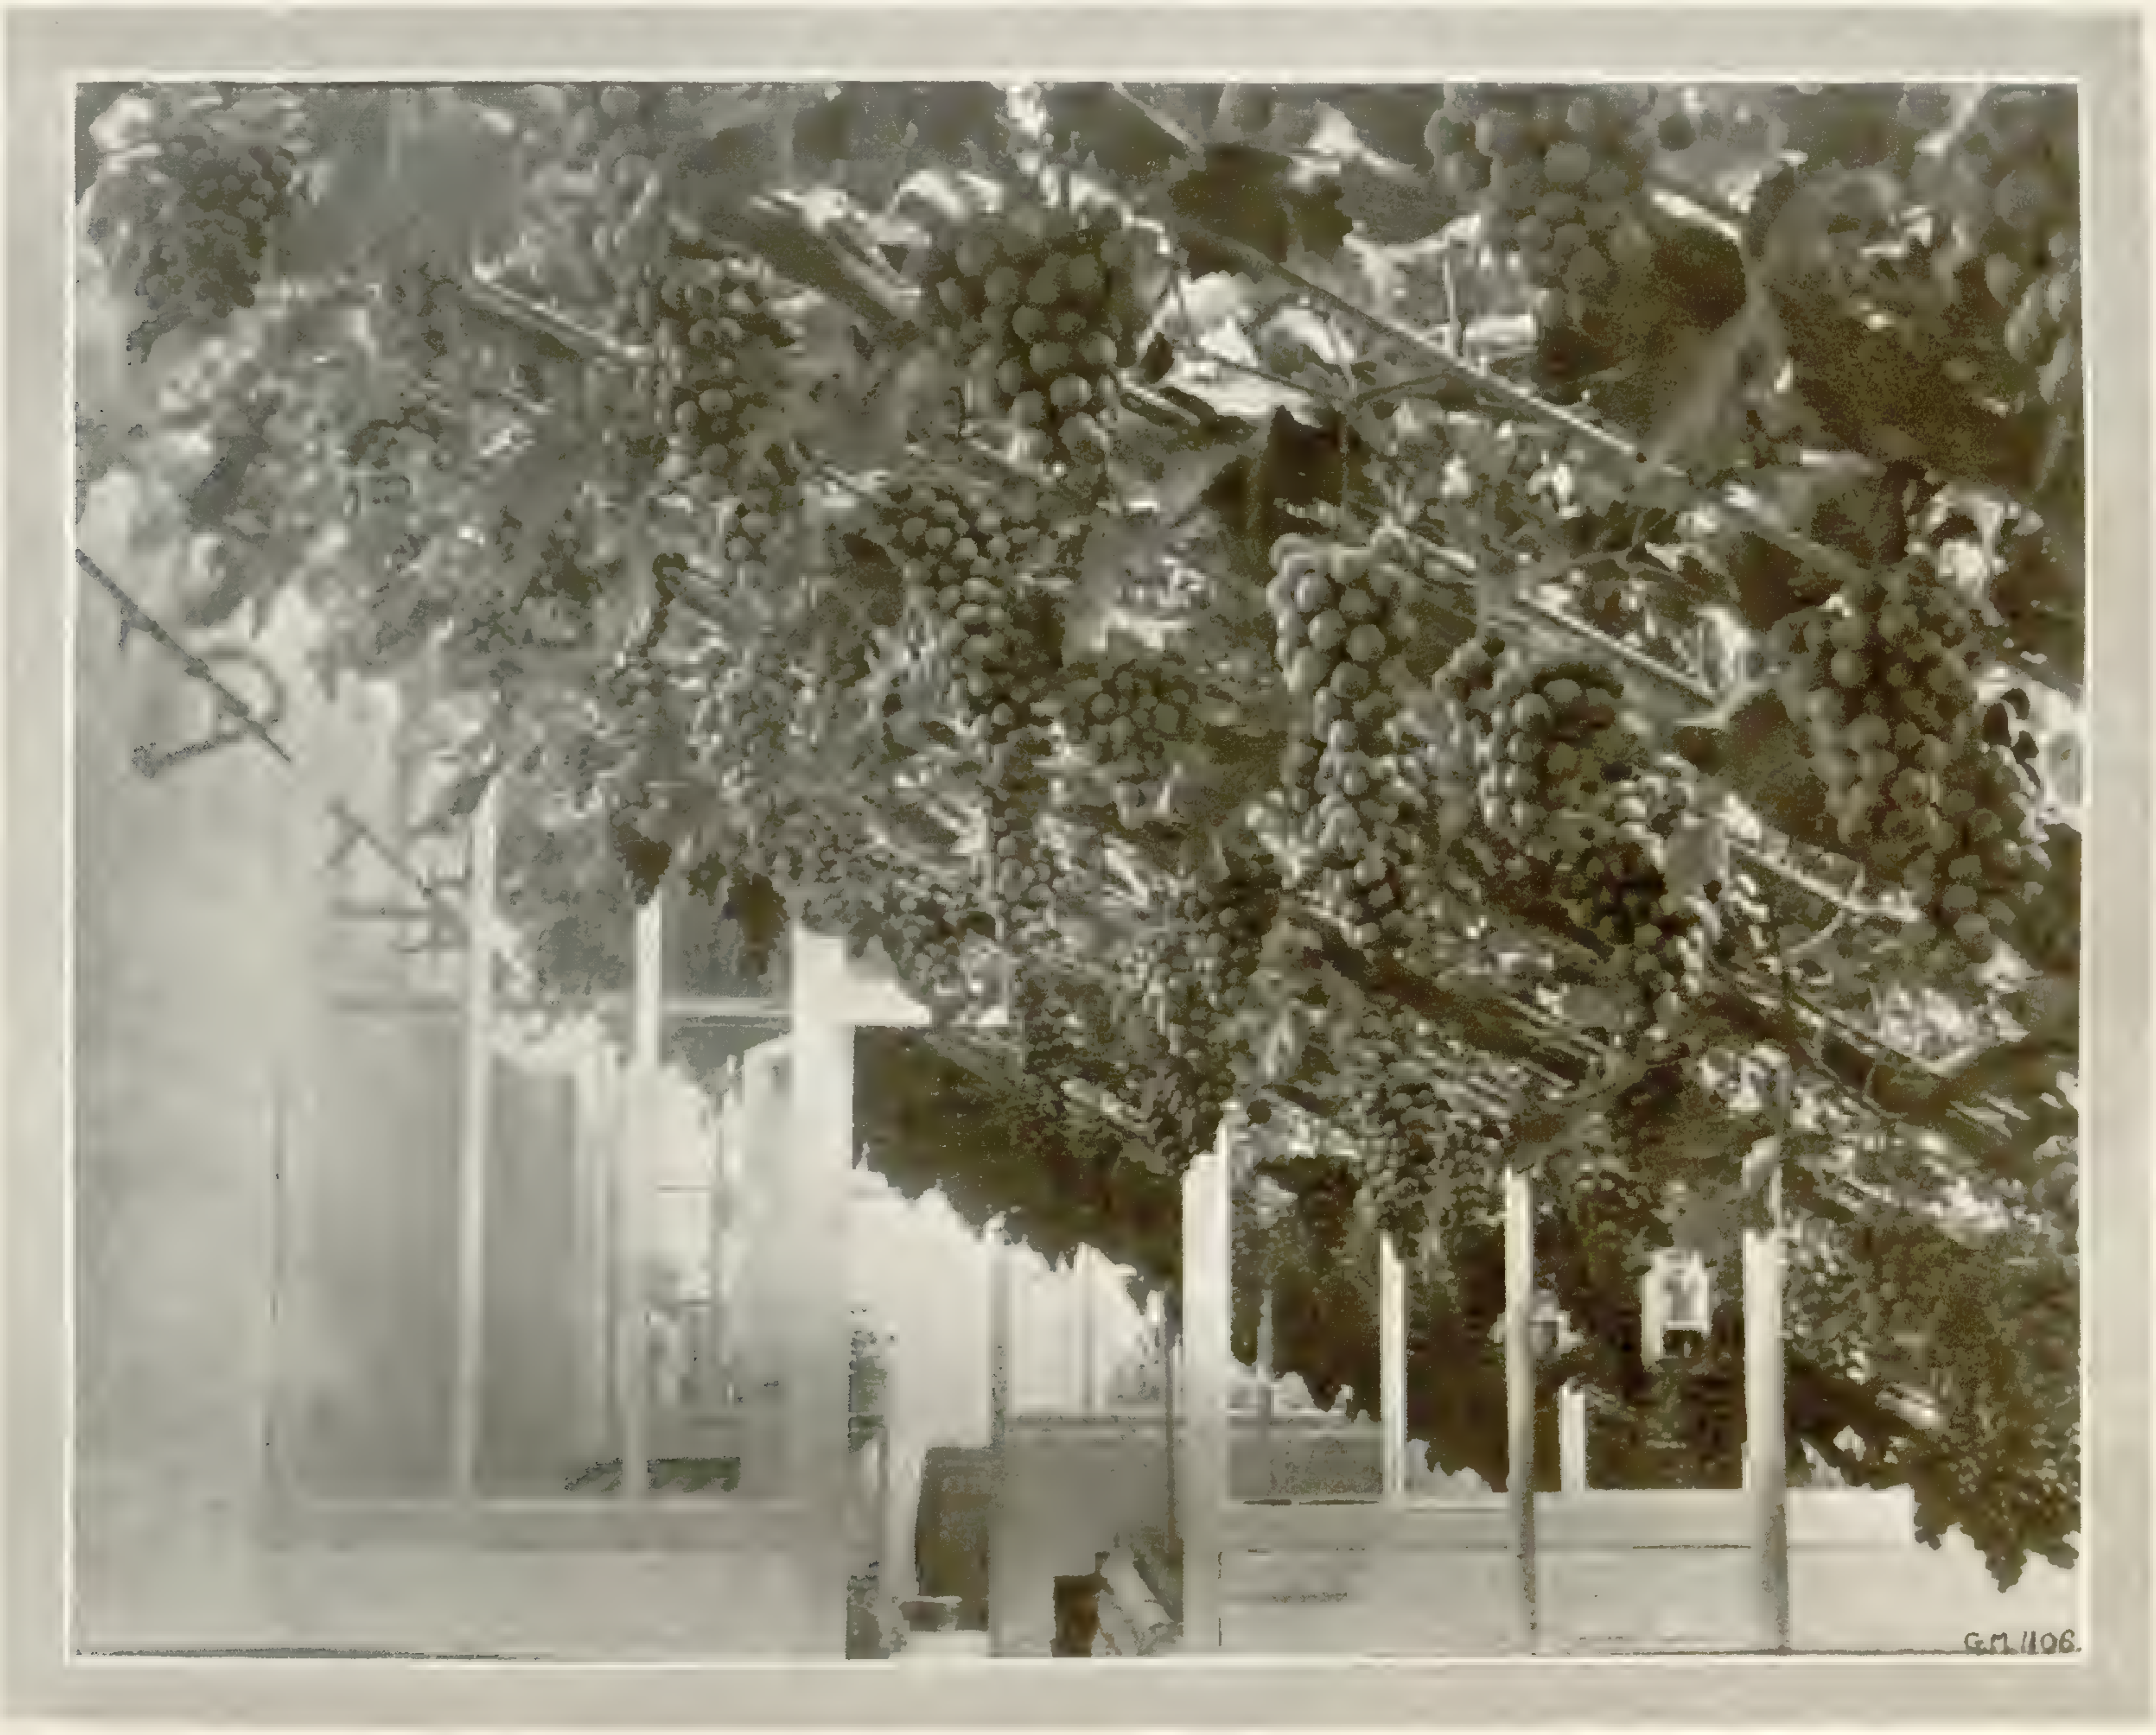
Perhaps it was because the American public are so fond of striped and flaked flowers of all kinds that Messrs. Isaac House and Son, of Bristol, named a fine sweet pea Yankee. This variety is interesting because it opens up a question of priority of naming. In the newly-issued "Catalogue of Sweet Pea Names" both Yankee and Mrs. Wilcox are described, but most specialists regard them as identical. The former is described as "crimson pencillings on pale grey ground; waved," while Mrs. Wilcox is described as "white, striped bright red." Yankee is credited to Messrs. Isaac House and Son for 1910, whereas Mrs. Wilcox is credited to Messrs. Gilbert and Son, Dyke, for 1909. No doubt the identity will be thoroughly established, or otherwise, at the sweet pea trials at Guildford this year, and if they are alike then it would appear that Mrs. Wilcox must be the name to retain. Mrs. Wilcox was exhibited in the competitive classes at the great London sweet pea show of 1909, but Yankee did not appear as such. Again, Yankee is recommended as a good waved sweet pea of the red-flaked section by the Floral Committee of the National Sweet Pea Society, but Yankee and Mrs. Wilcox are not bracketed in the list of too-much-alike varieties.

However, the variety is a very fine one, provided one has a taste for these striped and flaked sweet peas; it grows strongly, and carries large blooms, that are well waved, and very effective, the rich red or crimson markings being very bright.

A SUCCESSFUL EXAMPLE OF GRAPE CULTURE.

The cultivation of grapes has attained to so high a degree of perfection in this country that in visiting gardens one has opportunities for seeing many successful examples of grape production. However numerous they may be, the horticulturist never tires of seeing really fine crops of grapes, and those who are not specially interested in gardening seldom fail to give ready expression to their admiration for houses of grapes in which an abundance of large, finely finished clusters bespeak cultural skill of a high order. We have illustrated a considerable number of such houses within the past quarter of a century, and, as we know that they have been useful to readers as examples which the less experienced cultivators should endeavour to emulate, we have much pleasure in giving an illustration of two vineries in the gardens of The Grove, Carisbrooke, Isle of Wight, the residence of A. C. Marvin, Esq.

The two structures have an aggregate length of 70 feet, and the first of the two is wholly devoted to the Black Hamburgh, which is seldom seen in such excellent condition. As so well shown, the bunches are remarkable for their large size and uniformity, and the colour, we would add, was of the deepest. The second of the two houses is occupied by Muscat of Alexandria, Black Muscat, and Black Hamburgh, and the two Muscats were equally remarkable for weight of crop and high finish, it being quite exceptional to see the Black Muscat so finely coloured as in this instance. The grapes have always, Mr. Marvin states, been highly meritorious in these houses, which, it should be added, have no occupants other than the vines from the time the laterals are tied down until the whole of the grapes have been used. It may be mentioned as evidence of the interest Mr. Marvin takes in his garden that in 1909 the grapes were grown by himself. The thinning of the bunches (some 500), and tying the laterals, were done by Mr. Marvin, and, indeed, ventilating and every detail was seen to by him. We may assume that he is well satisfied with the success he has achieved, and we should imagine that the constant attention required by the vines must have been rather trying at times. However that may be, the crops were such as to justify Mr. Marvin being proud of his achievement, and to give an ample return for the time, thought, and skill devoted to the vines.



A FINE CROP OF GRAPES
In the gardens of The Grove, Carisbrooke, Isle of Wight.

Clerodendron fallax.—This useful stove flowering plant may be had in bloom from early autumn to mid-winter, and is most easy to grow, either from cuttings or from seed. I prefer the latter, as seedlings grow more freely. From seeds sown now and the seedlings kept growing steadily plants may be had to bloom in October. Sow in light peaty soil, in pans, placing the seeds one inch apart; potting off the seedlings as soon as large enough to handle. For cuttings, cut back the old plants fairly hard, and place in a stove or melon house; if kept syringed, they will soon break, when the cuttings may be put in singly in 60's as soon as long enough, and if placed in a propagating pit with a brisk bottom heat, they will readily strike. These will flower a month or two before those raised from seed.—T. S.

CULTIVATION OF THE VINE.

(Concluded from page 110.)

◆

Disbudding and Stopping.

Disbudding is an operation involving much skill and experience on the part of the operator, and has an important bearing upon the future growth of the vine. As soon as it may be perceived that the young shoots of about an inch in length are developing from each spur, it becomes necessary to select one of promising appearance, from as near the main stem as possible, all others being removed. This operation must be performed at the earliest possible date, as if the young buds are removed while in a somewhat advanced stage of growth, the vitality and energy of the plant are wasted.

Stopping is requisite in order to keep superfluous growths of shoots within bounds. The length of these shoots should be regulated in this manner to within about two joints beyond the bunch, and the operation itself is performed by pinching the end of the shoot between the finger and thumb as soon as two or three leaves can be distinguished beyond the bunch. This will give rise to the appearance of laterals, or as they are more correctly termed, summer lateral shoots, and the latter should receive similar treatment to the original shoots, the operation being repeated throughout the season, as necessity arises.

Tying Down.

Vines, when growing strongly, are of very tender structure, the shoots being easily broken or snapped out of their sockets by any undue strain. The grower must, therefore, not be too eager to secure them to the trelliswork, the first object of tying down merely consisting of securing their points from contact with the glass by means of thin strips of raffia, the final securance being more safely effected when the wood is hardened.

Setting or Fertilisation.

Sunshine is the principal factor in aid of fertilisation, and it is impossible to admit too much of this desirable agent in conjunction with a fine, mild, bracing atmosphere. By this means, the pollen is freely dispensed. There are diverse opinions as to the most suitable temperature to be maintained during the setting of the grapes, and while some recommend a temperature as high as 65 deg. by day, or 70 deg. by night, in late houses and on open walls vines set their fruit quite freely at a temperature as low as 45 deg. There are some varieties of grapes, notably "Muscats," which require artificial fertilisation, and this can be effected in a variety of ways; one plan consists of sharply tapping the rods, and so causing the pollen to fly out in clouds, while among varieties known as "bad or shy setters," recourse is sometimes had to the application of foreign pollen to the stigma by means of a hare's tail tied to a stick, the smallest quantity of pollen sufficing to fertilise the flowers. Another plan consists of drawing a dry hand or a silk handkerchief gently down the bunch about mid-day, the period most favourable for this operation. For greater security and safety, many cultivators fertilise all varieties by one of the above methods, whether Muscats or full setting Alicante.

Thinning.

The vine is perhaps the most fruitful of plants, being indeed liable to suffer through over fertility if the operation of thinning is not practised. The extent to which this should be done depends in a great measure upon the constitutional character of the plant, and a great consideration which helps us to determine this is the extent of foliage to be observed on the vine. It must be remembered that all life-giving properties are introduced into the body of the plant through the medium of the leaves, and with this fact in view, it is easy to see that a vine with poor sickly looking foliage can never be expected to crop well. It may be accepted as a general rule that a pound of grapes should be borne to one foot length of rod.

Thinning the berries, a delicate and somewhat tedious operation, requires great skill, and this can only be arrived at by considerable experience and practice. Any existing shoulders of an ungainly appearance should be removed, the others being supported symmetrically by thin strips of raffia. The bunch should be steadied by a small stick held in the left hand, and, using the scissors with the other hand, small stoneless berries can be first removed, and subsequently, the inside ones, thinning out the remainder sufficiently to allow each berry a full chance of developing full size. When thoroughly ripe the bunch will then present a solid compact appearance when placed on a dish. A well-known expert has suggested a praiseworthy plan of leaving the berries thick on the shoulders; this will cause them to swell upwards, and not only result in a larger bunch, but also add greatly to its beauty of form when cut. Disfigurement at this stage is of lasting effect; consequently, great care must be exercised in preventing contact with the hand or hair.

Experience.

ROOTING PERPETUAL-FLOWERING CARNATION CUTTINGS.

In no operation connected with horticulture is there more division of opinion than on the rooting of perpetual-flowering carnation cuttings. We differ in the matter of the best compost to use, the correct temperature, whether the open greenhouse or a close propagating case is best, whether in pots or beds, and so on. It is not my intention to condemn any method which I myself do not practice, nor do I maintain that the following is the only method of rooting these cuttings; other ways may give equally good results. I simply state that the following system has been built up from years of experience in some of the best carnation nurseries, and is a combination of English and American methods.

I am a strong believer in sharp clean sand in which to root cuttings, free from any decaying matter, and of a medium texture. A good grade Bedfordshire silver sand would be difficult to improve upon. Some may think that pure sand would have a weakening effect upon the cutting, but in practice this is not so; on the contrary, the cutting keeps much fresher in it, hence rooting with less effort, and a minimum amount of check.

An ordinary propagating case, sufficiently deep to allow the glass to be six inches clear of the cutting at the lowest point, with a bottom of soft bricks, which will absorb the surplus moisture, should be selected. This gives a free drainage, which is very important. Four inches of sand should be spread over the bottom of the case, directly on the bricks. This should be damped and beaten down firm, otherwise the cuttings will not stand upright after being watered in.

The warm end of an ordinary carnation house is ideal for propagating, and if a curtain is hung round the sides of the stage, so as to direct the heat from the pipes straight on to the bricks at the bottom of the case, the required warmth is easily obtained.

In this country, with its weak winter light causing a soft growth, I maintain that the cuttings should be protected from the air during the day by covering the case with glass, this being removed at night, and put on later each day until, after fifteen days or so, it is not used at all. If you have air upon the greenhouse, as you naturally would if it was a house full of growing plants, then treat the propagating case as a miniature greenhouse, not removing the glass entirely at night, but putting air on, increasing it each few days until the cuttings commence to root, when the glass should be dispensed with.

A carnation cutting should not be allowed to become dry. If once this takes place the cuttings are spoiled, if they are kept too wet, only a few weak roots are produced, which can never support a strong plant. This is a point in favour of pure sand as a rooting medium. Place the cuttings in rows, giving a space of two inches between the rows, and half an inch between each cutting.

Some will think that the above is rather a wholesale way of handling cuttings, which, of course, it is. The advantages are (1) that you have a large body of rooting medium, which is more easily maintained at a regular degree of moisture, being upon soft porous bricks, which themselves absorb or give moisture, according to the condition of the sand; (2) the bricks greatly minimise the fluctuation of the bottom heat. If the cuttings receive a thorough watering in the first place, little or no additional watering will be required until they are nearly rooted. This also is a great advantage.

I am a strong believer in carnation cuttings being rooted under cool airy conditions, this prevents them making any weak top growth during the operation, and has a great influence upon the constitution of the plant. I believe a bottom temperature of 55 degrees, and a top temperature of from 45 degrees to 50 degrees is best. Under such conditions cuttings will take a month to root. I quite realise that in a higher temperature cuttings could be rooted in less time and at less expense, but nothing can compensate for quality.

The aim should be not to wet the foliage of the cuttings more than is necessary. Perpetual overhead spraying, coupled with high temperatures, practised by some, does more to create disease and break down the constitution of varieties than any other practice I know.

Montagu C. Allwood.

FEBRUARY IN THE ROSE GARDEN.

Much of the work among roses during this month will necessarily depend upon the weather experienced, and to what extent the plants have escaped injury from frost. Still, there is March to contend with, and more than once I have known this the most trying month of the year. Keen, drying, and sometimes frost-laden winds are a great trial to all plant life, and very difficult to guard against. The ordinary winter covering being removed, and with the sap on the rise, the rose wood is still in jeopardy. This is especially the case with plants upon walls, standards, and the long growths upon pillars and pergolas. And this is the most valuable wood for early summer display. Although too early for general pruning, there is no reason why the thinning out of dead or superfluous shoots should not be carried on, and thus lighten the great pressure of work that inevitably comes upon us from March onwards.

Examine the beds and fill up gaps before too late. Keep all plants and cuttings trodden in firmly. Cuttings are often drawn a few inches upwards by frost, and, unless pressed back again, remain "hung," and the base of the cutting has not a good chance of rooting. Standards do not draw up so much, but none the less it is well to tread round them again as soon as the ground will permit; but on no account should the soil be trodden while it is wet.

If the plants have been mulched during the winter, and the weather is favourable, light digging between them may be done to advantage at any time, turning in the mulch two inches or so deep. Avoid putting the spade or spud too far into the soil, or the fibrous roots near the surface will become broken, and there cannot possibly be any benefit from digging deep enough to cause this. The tool should be set in about three inches, and then pushed along almost on the level, when the soil can be turned over easily. It need not be broken down much; this can be done later on, when using the hoe, and the free admission of air for a time is beneficial. All through the spring and summer hoeing will be facilitated by shallow digging now or in March.

A. Piper.

There is no better guide to the kitchen garden than Vegetables and their Cultivation, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables, saladings, and herbs for home use. Price 5s. net, by post, in box 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

ESPALIER FRUIT TREES.

The espalier system of training fruit trees has much to recommend it, and there are not many gardens in which a few espalier trained trees might not with advantage find a place. In these days, when fruit trees are subjected to attacks from innumerable enemies, such as insect and fungoid pests, it is a good practice, wherever possible, when planting fresh fruit trees, to plant dwarf trained as espaliers, cordons, etc. Espaliers can be most conveniently planted in borders by the side of walks; in this position they take up very little of the garden space, and are most conveniently situated for receiving the necessary attention of winter pruning, training, thinning the fruit, summer pinching, spraying, etc. Another point which is worthy of consideration is that the fruits on espalier trained trees can be more easily and economically protected from the attack of birds than trees grown as bushes, pyramids, or standards.

In preparation for planting, the border should be trenched two spades deep, and unless on good loamy soil of good depth, the bottom layer should not be brought to the surface, but be well broken up, and left in the same position. On heavy soils especially it is most essential that ample drainage is provided, as no fruit tree will continue in a satisfactory condition for any length of time when planted in a cold, wet, and undrained soil. On stiff land a good dressing of road scrapings taken from a heap that has been laid up for some months, will be found very serviceable for incorporating with the upper layer of soil. A little wood ashes, and a light dressing of soot may also be applied with advantage.

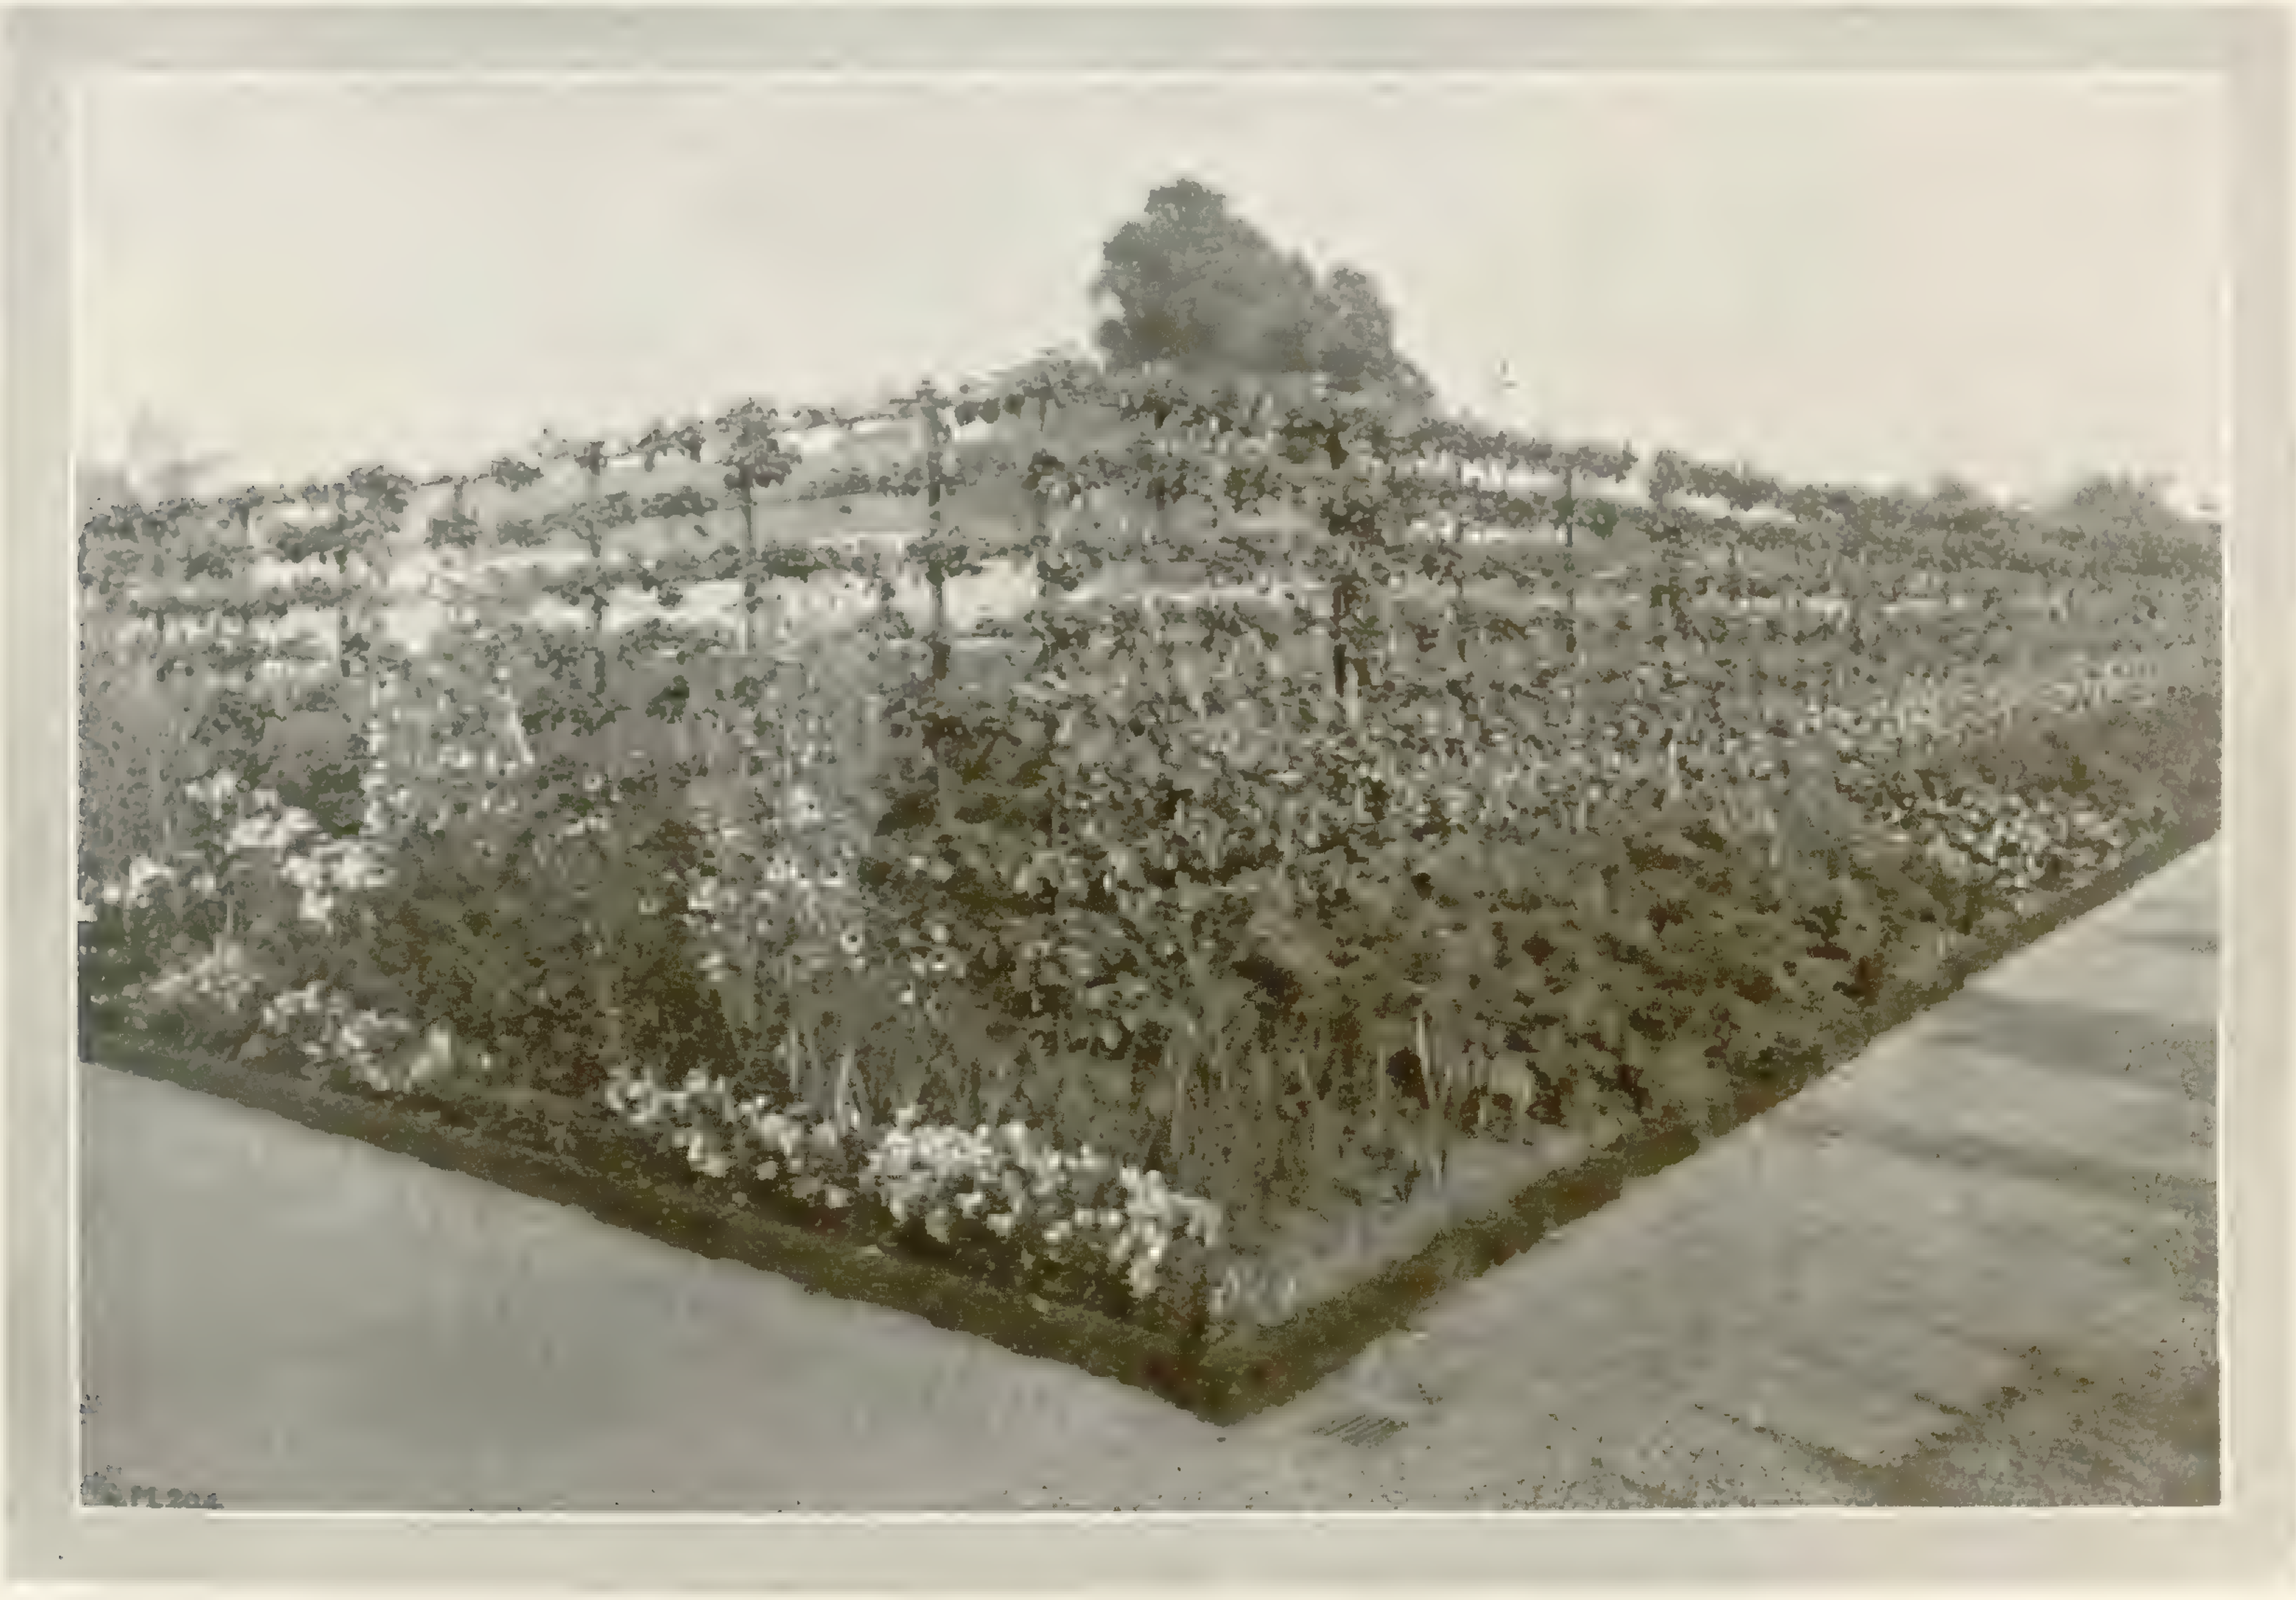
Strong manures should never be placed in contact with the roots of freshly planted fruit trees, but the fact must not be lost sight of that most fruit nurseries are established on good loamy land, and the condition of the soil is kept in good heart by the application of manure, with the result that the young trees when received from a nursery are found in a strong, healthy state, and to plant these on poor land is to give the trees such a check as will take them years to recover, hence the necessity of having the soil in good condition by incorporating with it when necessary a little well-decomposed manure. This will encourage the young roots to take possession of their new position, and be ready to furnish strength to the tree to enable it to push forth all its dormant buds in due season.

The supports to which the trees are trained may be either iron hurdles, iron standards and wire, or wood posts with wood laths; they are usually erected with five horizontal bars or wires, the bottom one should be one foot from the ground, and the same distance should be allowed between the others, but whichever kind of support is used, it should be fixed in its proper position previous to planting the trees, so that there is no disturbance of the young trees.

Trees with three tiers of horizontal branches having an upright leader to produce the next tier are the most suitable for planting. These should be purchased from a reliable firm where fruit trees are well grown, and as soon as they are received they should be unpacked, and if the roots are found at all dry they should be immersed in a tank of water long enough to thoroughly soak the roots. If the weather is favourable for planting no time should be lost in placing the trees in their permanent positions, but before doing so, examine the roots and cut away with a sharp knife any damaged portions, also any coarse roots which have a direct downward tendency. Plant so that the horizontal branches are slightly above the level of the supports, as this will allow for the natural subsidence of freshly broken soil; loop the branches lightly to the supports, and wait until the ground has well settled before fastening them in the usual way.

Young trees of this age when received from the nursery are often plentifully set with fruit buds, but on no account must they be allowed to carry fruit the season after being transplanted. Some varieties of apples, such as Lord Hindlip, Mr. Gladstone, and others, will sometimes form fruit buds at the end of the leading shoots, which, if allowed to produce fruit, will materially check the extension of the branches. Trees which show this peculiarity, and have not yet covered the full space allotted to them, should have their main branches cut back to a prominent wood bud, that the proper extension of the tree may continue.

The amount of pruning required depends greatly upon the variety. The chief point to be considered, until the topmost tier of branches is formed, is the main upright growth. Select two healthy wood buds which are pointing in the direction required, and are situated just below the position the new branches are to take, then prune the leader back to the bud immediately above these. This topmost bud will provide the new upright leader, and the other two buds will push forth and form a new tier of branches. This process should continue until all the branches are formed. Some varieties make but medium growth, while others make shoots three feet in length. The former will invariably push out all the dormant buds of the preceding season's growth without any shortening back of the leading branch, but the latter must be pruned back about one-third of their length to make sure of the branch being furnished with plenty of spurs. Always prune to a prominent wood bud pointing towards the direction required; when the trees have



ESPALIER FRUIT TREES AT BARROW COURT.
The residence of H. M. Gibbs, Esq. (gardener, Mr. Mincher), at Flaxbourton, Bristol.

covered their full area, the end of the main shoots are then treated as laterals.

In some instances one finds the branches of espalier trained trees covered so thickly with clusters of spurs that it is impossible for them to produce much fruit, and that of such a quality as to be practically useless. As the energies of the trees is not devoted to the perfecting of a full crop of fruit, it expends itself in the production of innumerable wood growths, which are cut back during the winter pruning, with the result that the branches are worse crowded with useless wood growth the following season, while trees which have been kept in a healthy and fruitful condition from the first, by having the older fruiting spurs shortened, or cut out as required, so as to admit plenty of light and air to all parts of the branches for the formation and perfecting of numerous fruit buds, invariably produce annually large quantities of choice fruits. Trees in this condition make but little wood, the whole energy apparently being concentrated in bringing the crop of fruit to maturity, and in developing the fruit buds.

There is another point which should not be lost sight of, i.e., that for all closely-pruned trees as espaliers, cordons, etc., summer pruning is absolutely essential; given this treatment, with a judicious shortening of the laterals, and a slight thinning out of the older fruiting spurs during the winter, trees may be kept in a healthy and fruitful condition for many years, bearing in mind that intelligent summer pruning conduces to the formation of fruit buds, while winter pruning encourages wood growths.

Rolleston Hall Gardens.

SMALL BORDERS FOR PEACHES.

I read, very recently, of some peach trees that were planted in good borders not bearing fruit until a period of seven years had passed. Much root pruning and labour had, in the meantime, been necessary on account of the very strong shoots which were annually made and did not mature satisfactorily. Of course, there are right and wrong ways of constructing the borders, and I am in favour of medium-sized ones. But I do not think it is the right way to excavate a lot of the original soil and then dump in many cartloads of chopped turves, and finally plant the peach trees in them.

I am a firm believer in rather shallow borders on sound drainage, and the area decidedly restricted. New turves may be utilised, nothing is better as a rooting medium. But the turves must be moderately dry, and be made quite firm as they are put in. A fair quantity of old mortar rubble should be mixed with the turves. This has been my plan of making peach and nectarine borders, no manure being put in, as all feeding has been done afterwards. Where it has not been possible to form an ordinary border I have built brick pits for the soil and roots, with the greatest success. In firm borders judiciously restricted, peach trees will commence to bear fruits from the time of planting, and if the crops be wisely regulated there will not be much necessity for lifting and root pruning.

Experienced cultivators know exactly the right treatment their trees require under the different circumstances, but beginners (and especially when they have not much space for borders) may take heart, and not be afraid to plant trees in restricted rooting areas.

Geo. Garner.

ACTION AND MOVEMENTS OF WATER IN SOIL.

In an important contribution to the Ontario Farmers' Institute, Professor W. P. Gamble, of the Ontario Agricultural College, gives the results of investigations made concerning the action and movements of water in the soil. We have already dealt with these results in a leading article (page 61), but we have had several requests for further information, and the paper is of such general interest that we reproduce it in a slightly abridged form:

Action of Water.

Of all the factors influencing the growth of plants, water is beyond doubt one of the most important. By virtue of its solvent power, it is the medium through which the solid substances in the soil are taken into the plant, conveyed to the appropriate organs to be digested, and then carried to the different parts of the plant to be used in the construction of tissue, or to be stored up for future use.

The water with its dissolved plant food (salts) is absorbed from the soil by the roots of the plants; and is then carried by the upward flow of the sap to the leaves. When it reaches the leaves, some of the water and all of the salts are retained for food manufacture. However, much more water enters the leaves than is needed for food, this excess having been used for carrying plant food from the soil. When the food has reached its destination the excess of water is evaporated from the leaf surface. This process of evaporation, called transpiration, is regulated according to the needs of the plant. If there is an abundance of water, transpiration is rapid; if the water supply is small in amount, transpiration is checked.

Under ordinary conditions plants lose very large quantities of water by transpiration; hence, before we can thoroughly understand and appreciate the importance of the moisture which reaches the soil by natural atmospheric agencies, we need to know clearly what relation this amount holds to that amount which is actually required for the production of good crops of different kinds.

Because of this need, investigations have been carried on at the different experimental stations to learn how much water is required to produce a pound of dry matter in some of the leading crops. In the course of the several trials the crops experimented with were able to utilise an average of 2.28 times the water which fell as rain during the growing season, and that in having it to use yields averaging 2.34 times that of the field crops were obtained. It does not, however, follow from these experiments that well tilled fields, if plentifully supplied with water, will in every instance produce such crops as are recorded; neither does it necessarily follow that these large crops owe their excess over normal crops simply to the extra supply of water. Climatic conditions, the available plant food in the soil, and manuring may also influence the yield. But we may safely say that, were the water supply under better control, and larger at times, the field yields would be much increased.

Water-holding Capacity of Soils.

Our first series of experiments were started with a view to discover the relative amount of water which soils of different kinds were capable of holding, and also to learn what effect the fineness of the particles had upon the absorptive power of soils. For this purpose zinc cylinders 2 centimeters in diameter and 18.2 centimeters long were filled with different kinds of soil, and the cylinders were then placed in a pan of water. The soils were prevented from passing out of the cylinders by means of wire gauze covered with pieces of linen fitted into the lower end of each cylinder. Before placing the cylinders in the water they were carefully weighed, so that the difference in weight before and after saturation represents the weight of water absorbed. The results of these experiments go to show that all soils are capable of absorbing and retaining moisture, but the extent to which this is done varies greatly.

A brief examination of the results shows clearly that the water holding capacity of a soil increases with the fineness of its particles. This data also emphasises the necessity of cultivating clay soils in the autumn. For when clay land is broken up in autumn or early winter the upturned surface is exposed to the action of the atmospheric agencies and the disintegrating action of frost. The soil is thus brought into a fine state of division, which greatly increases its water holding capacity, and when it is observed that heavy lands, after a dry season, seldom become fully saturated with water during the winter and spring, the importance of autumn cultivation can be appreciated.

It is a matter of common observation that seed sown on clay land, which has been cultivated in the spring, will take a long time to germinate. This is true in all cases except when a shower of rain falls shortly after the seed has been sown. This fact can be explained only in the following manner. When a clay soil is broken up in the spring of the year, large clods form which prevent the rapid development of the root system, thus much of the food stored up within the seed is used up before the plant can derive any nutriment from the soil. Besides this, there is a deficiency of moisture within reach of the roots, which will tend to retard the growth of the crop, and if a dry season should follow, the crop will suffer severely from drought. If, however, a clay soil is cultivated before the winter, the action of the frost on the water within the soil will force the particles apart, and thus the soil is left in the best possible condition to produce rapid germination of the seed, as the roots of the plants are its feeders, and all the water ordinarily used by it passes in through these channels, we can see at once the importance of having the soil in such a state of division that the roots may readily make their way through it. The roots and rootlets of the plant, in burrowing through the soil, come into intimate relation with the soil particles, which hold a film of water in firm contact. The roots are thus surrounded by the soil water, a portion of which they are able to absorb. The water passes up through the plant, carrying with it soluble plant food, which is conveyed to the elaborating organs.

As already stated, the plant's roots can absorb food only in the soluble form, and a large supply of mineral elements is required by growth. Therefore, not only is a large quantity of moisture demanded for the direct use of the plant, but its presence in the soil is necessary in order that the plant food may be rendered soluble, and it is perfectly evident that clay soil, if the particles are in a fine state of division, has the greatest power, other things being equal, to meet these demands for water. The difference between medium clay and loam is very slight, but the difference is in favour of the clay. Sand is generally supposed to have the lowest water holding capacity of any of our cultivated soils, but the experiment goes to show that its absorbent capacity is very little less than coarse clay.

At first it appears rather strange that the amounts of water held by the medium clay and loamy soils are so nearly alike, but the analysis of the loamy soil showed high percentage of vegetable matter, as well as a considerable amount of pure clay. The most striking fact brought out is that the water-holding power of the coarse clay is much less than that of the finer grades. An important practical lesson can be drawn from this connection with the practice of cultivating heavy clay soils in the spring. It is well known that when wet clays are broken up in the spring, large solid lumps are apt to form, which are very troublesome, because they prevent the formation of a good seed bed. These large lumps of clay also constitute a clay soil of extreme coarseness which has very little capacity for holding moisture.

(To be continued.)

A GREAT SWEET PEA CARNIVAL.

One of the articles in the new "Sweet Pea Annual" is from the pen of Mr. S. B. Dicks, and it tells of a wonderful Sweet Pea Carnival held in the Western United States. It is of such unusual interest that we reprint it, with due acknowledgments to the National Sweet Pea Society, together with a couple of the illustrations:

BOZEMAN SWEET PEA CARNIVAL: PROCESSION OF CARS.

The name flower of our flourishing society has been honoured in many ways, in many different parts of the world, but the climax has certainly been reached in America, where a city of about 10,000 inhabitants has successfully organised a two-day carnival in its honour.

The city in question is Bozeman, the county town of Gallatin County, Montana. This state adjoins the Canadian frontier, being due south of the provinces of Alberta and Assiniboia, and is in that part of the United States which is usually described as the "wild and woolly West."

During my recent visit to the States I observed in a railway folder a notice of some cheap excursion rates to the Bozeman Sweet Pea Carnival, on September 15 and 16, 1909, but as I did not see the notice until the 26th of that month a visit was out of the question. However, I at once wrote to the secretary for an account of the festival, and herewith append his reply. The illustrations here given are reproduced from post cards, which is a sufficient excuse for any imperfections they may have:

"Bozeman, Montana,
"October 5, 1909.

"Dear Sir,—Your inquiry of September 26, from Boston, as to Sweet Pea Carnival here, to hand, and in reply—

"Some years ago it had been demonstrated that this valley raised the largest and handsomest sweet peas in the world, this being emphasised very largely by seedsmen and those who had visited and seen the sweet peas here.

"Our altitude is 4,750 feet, and so too high for roses and many other flowers, but as the progressive spirit here had always made for advertising our town and valley they decided to take the flower which excelled here and make it Our Flower, and to make an annual celebration, a carnival time which should grant fame to both the sweet pea and to Bozeman.

"In 1906 we had a carnival, a Sweet Pea Carnival, something which carried away all who saw it. Bozeman always does things right, and that carnival was all right, followed by the second Sweet Pea Carnival in 1907, by the third in 1908, and it was a whopper. There were 98 rigs in line in that parade and seven bands, many features which made for beauty and for the true carnival spirit. And then this year came the fourth annual Sweet Pea Carnival, and it also was one the city was not made ashamed by.

"This year there were 76 rigs and floats in line, and even the weather laughed and was glad with us.

"We have noted that a Sweet Pea Society has been started in New York City, 'the first in this country,' and although we are in 'this country,' and had been holding the sweet pea aloft and praising its beauty and sweetness for four years, we shall not attempt any North Pole tactics over who was first.

"They call Bozeman 'The Sweet Pea City' now, and the whole State turns out to our carnival and applauds.

"A postal card picture does not do credit to anything, and surely not to beautiful rigs, flower trimmed, and bespeaking money and time from every inch of them. But they are all we have to show, in proof, that we had a Sweet Pea Carnival, and that it was good, and so we send you some of these cards by this mail. Maybe they will interest you as well as 'proving.'

"Sincerely yours,
"Secy. Carnival Committee.

"Mr. S. B. Dicks.
"New York."

BOZEMAN SWEET PEA CARNIVAL: A DECORATED CAR.

Red Cabbage.—If a small quantity of seed is now sown in a box, and placed in a gentle warmth, it will soon require pricking off, and finally hardened previous to planting out in April. Treated in this way, many of the disappointments and failures are avoided that are experienced when the plants are raised from autumn-sown seed.—G. Elwood.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

CLEANING THE GLASS.—It frequently happens after a fall of snow that considerable deposits of soot, etc., have been left on the glass and woodwork of the houses, thus causing an obstruction to light. In smoky manufacturing districts, and in localities where fogs are frequent, the deposit is very considerable, and as, at this season, it is desirable the plants should have the benefit of all the available light, these deposits must be removed by washing down the roofs as often as may be required. We find the brushes usually used for cleaning the outsides of railway carriages very suitable for the purpose. These should have handles fitted to them sufficiently long to reach to the top of the roofs. In rinsing down it is well to have the hose on the ridge and wash downwards, and thus avoid forcing the dirty water through the laps of the glass. It is well to have all down-spouts stopped before washing the roofs to prevent the accumulated filth being conveyed to the rain-water tanks. The gutters should be well washed out also before the down-spouts are unstopped.

SHADING. — Where sun blinds are required for shading the roofs of the houses they should now be procured, as some of the divisions of the orchid houses will need covering in the course of a few weeks; in fact, where houses have a southern aspect, some covering is necessary at the present time during bright sunshine at the middle of the day. It is all very well to talk about having foliage of a bronzy hue among odontoglossums, and some other orchids, but these hardened and over-ripened growths and pseudo-bulbs will in a few weeks show their disadvantages by a loss of foliage. Experience has shown me that it is very much safer to give plenty of light at the closing of the year than when the sun is gaining strength after the middle of February. It is a good plan to have two sets of blinds for the odontoglossum houses, using the larger mesh No. 3 shading from February to the end of March, on houses running north and south with roof elevation east and west. Then using No. 5, "ordinary shading" until the end of September. There is a tendency for plants under the lath roller blinds to become drawn, but otherwise this method of shading has its advantages for cool house orchids, as the blinds can be used during the winter on cold nights, thus saving a considerable amount of fire heat, which more than compensates for the disadvantages apparent in respect to drawn and weakly growths.

WATERING. — With the varying conditions outside it is by no means an easy matter to decide whether to withhold or give root moisture. It is better to err on the side of safety and permit the plants to remain in a dry state at the roots when low temperatures and unfavourable outside conditions prevail. It is not safe to water any plants unless the normal conditions of temperature has been reached. After snow storms or heavy rains, the rain-water in the tanks will naturally be reduced in temperature. Sufficient hot water should be added to raise the temperature of the water at least 2 deg. above the normal temperature of the house before it is used for watering or spraying purposes. — H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

POTTING.—Providing plenty of potting material has been prepared and warmed through, and the pots of various sizes washed and well crocked, no time should now be lost in potting all occupants of the stove that require it, and even those that do not require potting should be turned out, the drainage examined, and a little top-dressing given, so that when the plants are rearranged they all present a tidy appearance. Most stove plants require a fairly light and open compost, consisting of loam, leaf-soil, peat, sand, charcoal, and broken crocks, and, if this is used dracænas, aralias, pandanus, eulalias dieffenbachias, and phyllanthuses may all be potted pretty firmly, particularly plants that are attaining some size.

CROTONS require rather heavier soil than the before-mentioned subjects, but the same mixture will suit them well, with one-third more loam added, as well as a little bonemeal. Specimens or half-specimens of these should be very firmly potted, after which the growths should be staked or tied into position, so that the plant as it grows will be shapely. Should the house in which these are grown be anything other than a span-roofed one, the plants will require to be turned round frequently to preserve their colour and shape; it is surprising how quickly the shady side of a specimen will lose colour. Young plants that were rooted in the autumn should also now be fit for potting into 48's, and if they are given a good position on a shelf, where they can have plenty of syringing, they will soon make good useful decorative stuff, and will grow somewhat sturdier, and be of better colour than those rooted in the spring.

EULALIA VARIEGATA AND CAREX JAPONICA VARIEGATA are not generally classed as stove plants, but when grown in the stove they make such graceful plants for decorative purposes that I cannot pass them over. They are of little use in anything over a 48-sized pot, but if small divisions are potted up now into 60's they will make really useful plants in a short time, and those that did duty in 60's last season may be potted into 48's, and, after doing duty in the house, they may be thrown away, and others brought forward to take their place.

WATERING.—After this general potting and overhauling care must be exercised with the watering, making sure that the larger plants do not get dry, or the loss of leaves will be serious, and as for some time to come a good deal of fire heat will be required, constant damping will be necessary to keep a humid atmosphere. Overhead syringings may be increased as the sun gains in power, but do not overdo this until the plants begin to grow and root freely.

POINSETTIAS AND EUPHORBIAS will in most instances have passed out of flower, and if they have been gradually dried off they may be turned on their sides under the stages of a moderately cool house, where they may be left until they are required in April for cuttings.—Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

EARLY MUSCAT VINES.—Every precaution should be taken to prevent vines of this kind receiving a check while in blossom, and consequently at the approach of this stage the laterals should have necessary stopping attended to, and be drawn down sufficiently to prevent contact with the glass, while the borders should be examined, and be given, if advisable, a watering with tepid water. When the blossoms open particular care must be taken to maintain the atmosphere of the house in a buoyant condition, by maintaining, in agreement with the weather, a night temperature of 65 to 70 deg., with, on dull days, an increase of from 5 to 10 deg., and about 10 deg. more from sun-heat, accompanied by careful ventilation. While the pollen remains in a fit state distribute it at midday by the assistance of a dry rabbit's tail, and by an occasional gentle shaking of the vines. Should the air become parched lightly spray the border surface early in the morning of fine days.

PRINCIPAL HOUSES OF MUSCAT VINES.—As Muscat grapes require a long season of growth, the chief houses, after due preparation, should be closed before the end of the month. In mild weather maintain a night temperature of 50 deg., allowing a slight fall in cold weather, and the usual rises by day, accompanied by a moist atmosphere, and syringing of the vines with tepid water several times during the day.

POTTING PINEAPPLES. — About this date plants of Queen pineapples, grown from suckers potted early last autumn, should be ready for a shift into their fruiting pots. For this purpose use efficiently-drained pots of twelve inches' diameter, and a compost of fairly dry light turfy loam, torn into moderately small pieces, and freed of its fine particles; add to each barrow-load a 7in. potful of bonemeal, or of an artificial vine manure, and a good sprinkling of soot. Before turning the plants from their pots, see that the soil is moist throughout, and pull away their bottom short leaves. In potting place the plants deeply enough in the pots to admit of the surface soil being well covered with fresh compost; allow sufficient space for watering, and firmly ram the compost; as the work proceeds plunge the pots two feet apart in a bed with a temperature of about 85 deg. Afford a night temperature of 60 to 65 deg., and corresponding day rises. Lightly spray the plants daily overhead, but water them sparingly until free root action takes place.

SUCKERS OF PINE APPLES. — Suckers upon winter fruiting plants of Charlotte Rothschild, and Smooth Cayenne should be potted in 7in. pots as they become fit. For affording from one house a lengthened supply of fruits of these varieties, it is necessary to pot several batches of suckers at suitable intervals.

ORCHARD HOUSE TREES.—Fruit trees in pots should be placed under glass at an earlier or later date, according to the time their fruit is required. When this is attended to, those that were not repotted, or top-dressed in the autumn, should have the surface soil removed, and be given good loam moderately mixed with crushed mortar rubble and a suitable artificial manure. During the early stages of the growth of the trees the temperature should not (from artificial means) exceed 45 deg., more or less ventilation being given when the weather is favourable. Do not over-water the trees. Fumigate the house immediately before the blossoms expand, and during the flowering period avoid a damp atmosphere by giving a little artificial warmth, accompanied by fairly free ventilation.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

TRENCHING AND DIGGING.—The time has arrived when these operations should be pushed forward with the utmost expedition, whenever the weather permits, to enable the bottom soil to receive the full benefits derived from exposure to winds and frosts that will certainly be experienced before seed-sowing and planting become general.

PEAS that were sown during the autumn in pots to produce a supply under glass should be encouraged in every way, but do not use fire heat, except during very severe weather. Top-dress them with equal parts of spent mushroom-bed and loam, and give them their final staking; give abundance of air during favourable weather, syringe and close the house early in the afternoon to husband the sun-heat as much as possible. A sowing can now be made out of doors, choosing a south sheltered border. Sow in trenches, which should be made with a nine-inch draw hoe. When completed, the soil should be three inches below the general level, thus providing shelter from cutting winds. Should it be very wet after sowing, boards wide enough to cover the trench are of great benefit, as they will prevent the soil becoming too wet during germination. Early Giant and Early Morn are of fine quality for this sowing. Make further sowings in boxes, and place under glass, just excluding frost.

ONIONS.—Those sown as previously advised will now require pricking off into boxes or pots. If put in boxes a distance of three inches from plant to plant will be the most suitable. I might say we find just as good results from boxes as when small pots are used, and they have the advantage of being economical. A good compost is formed by well mixing three parts loam, one part leaf-soil, one part spent mushroom-bed manure, and enough sand to keep the whole quite porous. Make the soil quite firm in the boxes, and when the young plants are pricked off give a good watering with tepid water, and place in a temperature of 50 deg., exposing them to full sunlight. Regular sprayings will now be beneficial to them.

PARSNIPS.—Providing the ground is in a suitable condition, a sowing of seed should be made about the 21st of the present month Quarters that were occupied by early celery last autumn will form an ideal site for this crop, particularly if it was well roughed up as the celery was dug. The same should by this date be well pulverised, and only need a slight levelling and forking over, adding, as this work proceeds, a good dressing of soot and burnt garden refuse. Sow the seed in drills that are eighteen inches apart. If exhibition specimens are required the best results are obtained by boring holes three or more feet deep, at eighteen inches apart, allowing two feet between the rows, filling the holes with finely-sifted compost, consisting of loam, leaf-soil, and sand.

POTATOES.—To succeed those growing in pots and boxes, pits should be prepared for succession. Prepare a heap of chopped loam, and incorporate therewith flaky leaf-soil, well decayed manure, and a good dash of burnt garden refuse. This should be kept under cover until used, when it should be formed into beds in the pits or frames not less than ten inches deep. When the compost has settled, and become of the same temperature as that of the pit, plant prepared sprouted tubers three inches deep in rows sixteen inches apart, and fourteen inches from set to set. Sutton's Ringleader and Webbs' Express are excellent varieties for frame culture.

CAULIFLOWERS.—Those sown early in the year will now need picking off into other boxes before they become drawn. This batch will be found of great service if grown on steadily for frame cultivation, planting them at one foot apart when this takes place. A sowing of Early Giant, Autumn Giant, and Walcheren should now be made in boxes. Place the boxes in quite a cold house, just to exclude frost, aiming at a very sturdy growth with this batch, which will prove very valuable for July and August supplies.

CHIVES, MINT, AND TARRAGON should be introduced into a warm pit as required. If the tarragon crop is short, it can readily be increased by taking cuttings from the stools when two inches long, inserting them thickly in small 60's that have been filled with light, gritty compost. — G. Elwood, Swanmore Park Gardens.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

FALMOUTH SPRING FLOWER SHOW.

This Show will be held on April 21st and 22nd, and not 26th and 27th as previously advertised. A large sum is offered in Cash Prizes, as well as Gold Medals, Silver Bowls, Cups, and Plate. Schedules from R. E. GILL, Hon. Secretary, Falmouth.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Chrysanthemum Society.

The annual general meeting of this long-established floricultural society was held at 6.30 p.m., at Carr's Restaurant, Strand, W.C., under the presidency of Sir Albert Rollit. There was not a very large attendance of members, but those who take a leading part in the society's affairs were present. There were probably fifty members present.

There were no controversial questions up for consideration, and the society is in better circumstances than for a long time past, and probably this was the reason that the proceedings were unusually brief, and only lasted an hour.

After the observance of due formalities the report and balance-sheet having been circulated, were taken as read; they are as follows:

REPORT OF THE COMMITTEE FOR 1909.

The Executive Committee have pleasure in submitting to the members their annual report for the year 1909.

At the last annual general meeting, Sir Albert Rollit, LL.D., D.C.L., was unanimously re-elected president of the society, a fact which gave your committee particular pleasure and satisfaction, as they were thus assured of Sir Albert Rollit's valuable advice and counsel on the many difficult matters which had to be considered at the beginning of the year.

Owing to the legal proceedings in connection with the Crystal Palace Company your committee were only able to arrange for one large show in 1909, which was held on November 3, 4, and 5. Your committee greatly regretted that it was not possible to hold the early and late shows as heretofore, as they consider these smaller shows to be an important and essential part of the National Society's work. The October and December shows of this society have been almost unique in this country, and have afforded an opportunity of studying the early and late varieties, which has been much appreciated by chrysanthemum growers in general and members of the society in particular. Your committee consider the holding of these extra shows as part of the settled policy of the society, and subject to being able to make the necessary financial arrangements they will again be included in the society's programme in the future.

The grand autumn show held at the Crystal Palace in November must be proclaimed an emphatic success, in spite of one or two circumstances which might have been expected to militate against it. The chrysanthemum season was perhaps not at its utmost height until about a week after the show, and the extremely wet weather experienced during the whole summer and autumn, and especially during the week or two prior to the show caused a diminution in the number of entries from amateurs. This, however, was counterbalanced by the entries in the open classes and the trade exhibits. Both the naves at the Crystal Palace as well as part of the central transept were again thrown open to the society's exhibits. Competition in the classes for large Japanese blooms was very keen, but for incurved blooms the date was early, and the entries suffered also by reason of several withdrawals at the last hour. The trade exhibits were again a dominating feature of the show, and the thanks of the society are due to all those members of the trade who so consistently rally to the support of the society.

Sir Albert Rollit presided at the judges' luncheon, which was held at the Crystal Palace on the first day of the show. In proposing the toast of "The Judges," the President acknowledged with gratitude the great services rendered by these gentlemen in an honorary capacity, and pointed out that the strict impartiality with which the judges made their awards at all the society's shows had helped in a large measure to place the society in the high and honourable position which it held in the horticultural world.

A highly successful conference was held at Essex Hall on Wednesday, October 6, 1909. Mr. T. Bevan occupied the chair at both the afternoon and evening sessions, and the following papers were read:

"Chrysanthemums as Annuals," by Mr. Charles H. Curtis.

"Early Single Chrysanthemums," by Mr. W. Wells.

"Late Market Chrysanthemums," by Mr. J. B. Riding.

"The Best Chrysanthemums for Cut Flowers": (a) From a commercial point of view, by Mr. P. A. Cragg; (b) From an æsthetic point of view, by Mr. D. B. Crane.

It is worth placing on record that 83 members were present at the afternoon session and 115 at the evening session, but in reckoning the value of these gatherings regard must be had to the very much larger audience to which the speakers were in reality addressing their remarks through the medium of the Press.

Several members of the trade exhibited groups of cut flowers and plants at the hall, and a unique exhibit was that of a bag of five gallons of chrysanthemum seed by Messrs. W. Wells and Co., Lim. This was probably the first time in history that such an exhibit was to be seen, and gave additional interest to the opening paper on "Chrysanthemums as Annuals." Hearty votes of thanks were tendered to the readers of the respective papers.

Arrangements have already been made for the holding of another conference in December next, full particulars of which will be issued to members in due course.

Eight meetings of the Floral Committee were held during the season, when 188 new varieties were submitted for consideration, of these 26 were awarded First Class Certificates, whilst 12 were commended. Votes of thanks were also passed to Mr. J. H. Witty and Messrs. W. Wells and Co., Lim., for collections of early varieties at the September meeting. In several cases the committee expressed a desire to see certain varieties again, and in this connection it is interesting to note that in more than one case where a similar desire was expressed in 1908 blooms were again brought forward in 1909, and were found to be well worthy of award.

The sections to which the certificates were awarded are shown in the following table:

	First Class Certificates.
Early-flowering Japanese	2
Japanese	6
Early-flowering Singles	2
Singles	4
Japanese Single	1
Incurved	3
Decorative and Market	8

In the list of certificated and commended varieties which will appear in the schedule a description of each variety will be given, and this, it is believed, will make the list still more useful to members.

Award for Colour.—The question of granting a special award for colour was very fully considered both by the Floral Committee and the Executive Committee, and it was unanimously decided to institute a new award, to be known as an "Award for Colour." It sometimes happens that a variety is submitted to the Floral Committee which has a particularly pleasing shade of colour, but which may not reach the necessary standard of quality on all points to receive the First Class Certificate. From a decorative point of view, however, such flowers are especially worthy of notice, and it will now be in the discretion of the committee to grant an Award for Colour in these cases.

The general body of members do not yet take that interest in meetings of the Floral Committee which might reasonably be expected. There was certainly an improvement in this direction during the past season, but your committee feel certain that if the value of these meetings were more fully understood there would be a much larger attendance of members on each occasion. To the real enthusiast who desires to keep his knowledge of the chrysanthemum up to date they offer opportunities which are not to be obtained in any other way.

The close of the financial year finds the society in a much more satisfactory position than was anticipated earlier in the year. For the first time for some years the balance-sheet discloses the fact that the whole of the ordinary liabilities of the society were paid before the accounts were ruled off. The position is therefore summarised as—Assets, £104 1s. 8d.; liabilities, nil.

The delay of the Crystal Palace Company in paying the consideration money due to this society under the 1908 contract was referred to in the last report. Unfortunately, your committee were compelled to place the matter in the hands of the society's solicitors, and judgment was obtained against the company. Before execution could be levied, however, a receiver was appointed by the High Court on behalf of the debenture-holders and the board of directors ceased to have any control. The receiver, Mr. E. I. Husey, is still in possession, and an order has been made for the winding-up of the Crystal Palace Company.

In the circumstances in which they were placed your committee were regretfully compelled to bring into operation Rule XI. By drawing upon the whole of the society's reserve fund the committee were able to pay 50 per cent. of the prize money, and this was paid to the prizewinners, with an undertaking that the balance should be paid as and when the remainder of the money due from the Crystal Palace Company might be received. The affairs of the company are not yet settled, and it will probably be some time before the liquidation is completed.

The contract for the holding of the 1909 show was made with the receiver, Mr. E. I. Husey, and the consideration money was paid in full on the first day of the show. The prizes were all issued to the winners immediately thereafter.

The accounts for the year 1909, duly audited, are appended to this report.

The committee have decided to hold shows during 1910 at the end of September or beginning of October, November 8, 9, and 10, and December, the latter being in conjunction with the conference to be held at Essex Hall. Negotiations are now proceeding with regard to same.

Special prizes were given during the past year by the following donors, viz., Sir Albert Rollit, D.C.L., LL.D., president; C. E. Shea, Esq., vice-president; the Ichthemic Guano Company, Mr. R. Sydenham, and Mr. J. Williams, Messrs. Clay and Son, Messrs. W. Wells and Co., Lim., Mr. R. F. Felton, and Messrs. Webb and Sons. To all of these the committee tender their grateful thanks, at the same time expressing the hope that all these names will be found in next year's list of special prize donors, together with many more which have never yet figured in that list.

The membership of the society has not progressed as much as the committee would have liked, and they again ask the present members to use their best endeavours to increase the membership roll during the coming year.

In connection with the International Exhibition to be held at Brussels during 1910, the president of this society, Sir Albert

Rollit, is acting as chairman of the English section of horticulture, and Mr. Thomas Bevan and Mr. C. Harman Payne are serving on the committee. It is hoped that the society will be able to send a representative exhibit to the chrysanthemum show during the last week in October on similar lines to that which was sent to Paris in 1900.

On behalf of the Executive Committee,
Thos. Bevan, Chairman.
E. F. Hawes, Vice-chairman.
Richard A. Witty, Secretary.
January 17, 1910.

Sir Albert Rollit moved the adoption of the report and accounts, and in doing so said the report was one of "work well done and honour well won." The year ended was not a really good one for the chrysanthemum, but the society's big show was an excellent one, and the trade displays were magnificent. There had been a conference, of great educational value, and the work of the Floral Committee was also of immense value to all lovers of the flower. He was glad to find a new Award for Colour was to be instituted for 1910. The membership called for little remark beyond a strong request that every member should endeavour to bring in some new members this season. The finances of the society were in splendid order, and the balance to the good was an excellent one, and liabilities were nil. Mr. T. Bevan formally seconded the resolution, and it was carried.

On the motion of Mr. J. Green and Mr. Moorman, the auditors, Messrs. Lake and Dean, were heartily thanked for their services. The President, Sir Albert Rollit, on the motion of Mr. Simpson and Mr. G. Dean, was unanimously re-elected president. Mr. J. Green was elected treasurer on the motion of Messrs. Witty and Bevan. Mr. Thomas Bevan was re-elected chairman of committee, and said this was his twenty-sixth year of committee work. Mr. E. F. Hawes, was re-elected vice-chairman.

The President moved the re-election of Mr. Harman Payne as foreign corresponding secretary, and eulogised his services; the re-election was unanimous. Mr. Payne responded, and referred to the origin of the "Repertoire de Couleurs," which had been referred to. Mr. R. H. Witty was unanimously re-elected secretary, on the motion of Messrs. Moorman and Curtis.

The election to fill the twelve vacancies on the committee was then proceeded with, but as only the requisite number were nominated there was no need for a ballot; those elected were: Messrs. W. Hiehle, W. Howe, H. J. Kybert, J. B. Linford, J. W. Moorman, J. T. Simpson, E. F. Such, J. H. Witty, F. Ladds, H. J. Jones, H. Farmer, and W. Rogers.

Mr. C. Harman Payne proposed that Mr. C. H. Totty (America), Mr. T. W. Pockett (Australia), and Mr. René Momméje (Paris) be elected corresponding members of the society, as a slight recognition of their services in connection with work among chrysanthemums. A strong recommendation was also put forward for the election of Mr. J. H. Witty as an honorary member, and it was regretted that, according to rule (absence of notice), the recommendation could not be put into force.

On the motion of Mr. D. B. Crane and Mr. J. H. Witty, a hearty vote of thanks was accorded the president for his services during the year, and that evening, and, in reply, Sir Albert Rollit gave a few humorous stories of his recent election experiences.

Bournemouth Gardeners' Association.

ANNUAL MEETING.

On February 1 the annual meeting of the members was held, and a good deal of business was transacted under the able chairmanship of Councillor T. K. Ingram, of the Parkstone Nurseries.

The annual report, a very favourable one, was read and adopted, also the statement of accounts, which showed a balance on the right side. The programme of lectures and papers to be read during the coming session was submitted, and received with much approval, as all the subjects to be dealt with are of a very useful and interesting character. All the officers were re-elected with the exception of a few members of the committee, where some changes were made. J. H. Ralph Smythe, Esq., J.P., was re-elected president with much heartiness. This gentleman takes a great deal of interest in all matters appertaining to horticulture, and supports the society in a genial manner. All the vice-presidents were re-elected en bloc.

Mr. J. B. Stevenson, F.R.H.S., must feel very proud of the fact that the annual meeting, now being referred to, is the twenty-first —the coming-of-age of the association, with which he has been so intimately connected as honorary secretary ever since its birth.

A full meed of praise is due to Mr. W. Shave, Mr. W. Reeves, and Mr. G. Barge, the assistant secretary, hon. treasurer, and librarian respectively, for the able manner in which they have carried out their duties during the past year. The members of this association are fortunate in having living amongst them Mr. Clarke, a gentleman who is an enthusiast, especially as regards roses. He intends to hold an exhibition of roses in his own beautiful gardens on July 1, and to provide the prize money. The members of the Bournemouth Gardeners' Association are to compete, by the kind request of Mr. Clarke. This event is being looked forward to with much pleasure. It is a new innovation, one of the right kind, and is sure to give an impetus to matters horticultural in this district during the coming year.

Southampton Royal Horticultural Society.

The annual general meeting was held at the Municipal Buildings, on Friday, January 28, the Mayor presiding over a larger attendance than usual.

The annual report presented must, under all the circumstances, be considered satisfactory. The very unseasonable weather on the occasion of the rose and carnation shows seriously reduced the society's receipts. Fortunately a garden fête held in the president's grounds at South Stoneham was a great success, and enabled the council to issue a statement of accounts with an improved credit balance.

The receipts for 1909 were:

	£	s.	d.
1908 Items	£23	8	10
Garden Fête	75	16	8
Rose Show	279	6	3
Carnation Show	115	5	3
Autumn Show	167	2	6
General Account	95	15	7
Total	£756	15	1

EXPENDITURE.

	£	s.	d.
1908 Items	£14	3	8
Garden Fête	39	5	0
Rose Show	274	17	1
Carnation Show	131	0	4
Autumn Show	183	5	10
General Account	96	7	7
New Material	1	14	6
	740	14	0
Credit Balance	16	1	1
Total	£756	15	1

ASSETS.

	£	s.	d.
Cash	30	4	1
Material, Cups, etc.	74	9	2
	£104	13	3

The President, Lord Swaythling, and all the vice-presidents were re-elected. For the chairmanship of the council there were two nominations — the retiring chairman, Mr. Blakeway, and Mr. E. Kemp Toogood, the latter being elected by a very large majority. The other officers were all re-elected, including the secretary, Mr. C. S. Fuidge; this will be his thirty-eighth year of office, and, although over seventy years of age, he is still active, and hopes to arrange for the jubilee shows in 1912.

ZONAL GERANIUMS IN WINTER.

The value of single-flowered zonal geraniums in winter is yearly becoming more appreciated in private gardens. This fact is emphasised by the number of exhibitors at those autumn shows where prizes are offered for trusses of bloom. For use in a cut state, or when growing on the plants, pelargoniums have much to recommend them now that the varieties are so improved. The colours are decisive, the habit of growth excellent, and freedom of blossom is assured.

In the Royal gardens, Frogmore, winter pelargoniums are largely grown, and apparently appreciated. In flower during November and the two following months they make a pleasing change from chrysanthemums.

The cultural details are but few. Strike the cuttings in January or February at the latest, grow the plants steadily and sturdily, so that they are well matured by September. Keep the points well pinched out to induce a bushy growth.

The following is a brief selection of desirable varieties: Arabic, bright scarlet; Brussels, blush pink; Paris, white and shrimp pink; Sir Thomas Hanbury, crimson; Sir Ernest Cassel, scarlet; Mrs. G. Cadbury, salmon; Lusitania, deep magenta; Mauretania, white and salmon; Lady Warwick, white with a pink picotee edge; Kingswood, bright scarlet with a white eye; Frogmore, magenta and crimson; Duchess of Roxburghe, salmon self; Cymric, purple self; Caronia, bright rosy-pink; Germania, soft salmon rose; Hopedene, crimson lake, white centre; Cevic, delicate flesh; Caledonia, blush pink; Naples, scarlet, white eye. S. H.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

RUST IN BEGONIAS.—G. W. B., Warwick: The leaves give ample evidence of an infestation of the begonia mite. This mite is a species of tarsonymus, and was first noted in the West of England as causing a great deal of mischief among begonias and other plants. It was first determined by Mr. Michael, as for a long time the origin of the trouble was not properly understood. Dusting the infested plants freely with tobacco powder will hold the pest in check, but where the conditions under which the plants grow are drier than usual, then there is a great difficulty in combating the mite. Sulphur is useful also as a remedy if prepared with soft soap and water; a good plan is to take a handful of soft soap and knead into it a considerable quantity of flowers of sulphur (do not be afraid of the sulphur), and then dissolve the whole in a gallon and a-half of warm soft water; in this mixture dip the plants, and repeat the operation at intervals of a week, until the pest is got rid of. This mixture is deadly to the mites, but does not appear to destroy their eggs, hence the need of at least a second dipping. Either a nicotine or a quassia solution, with a little soft soap added to make it slightly adhesive, have been given as useful remedies, but we believe the sulphur mixture is the best as a cure for the mite, while dusting with tobacco powder is useful to stop an attack if the pest is noticed before it has time to spread far.

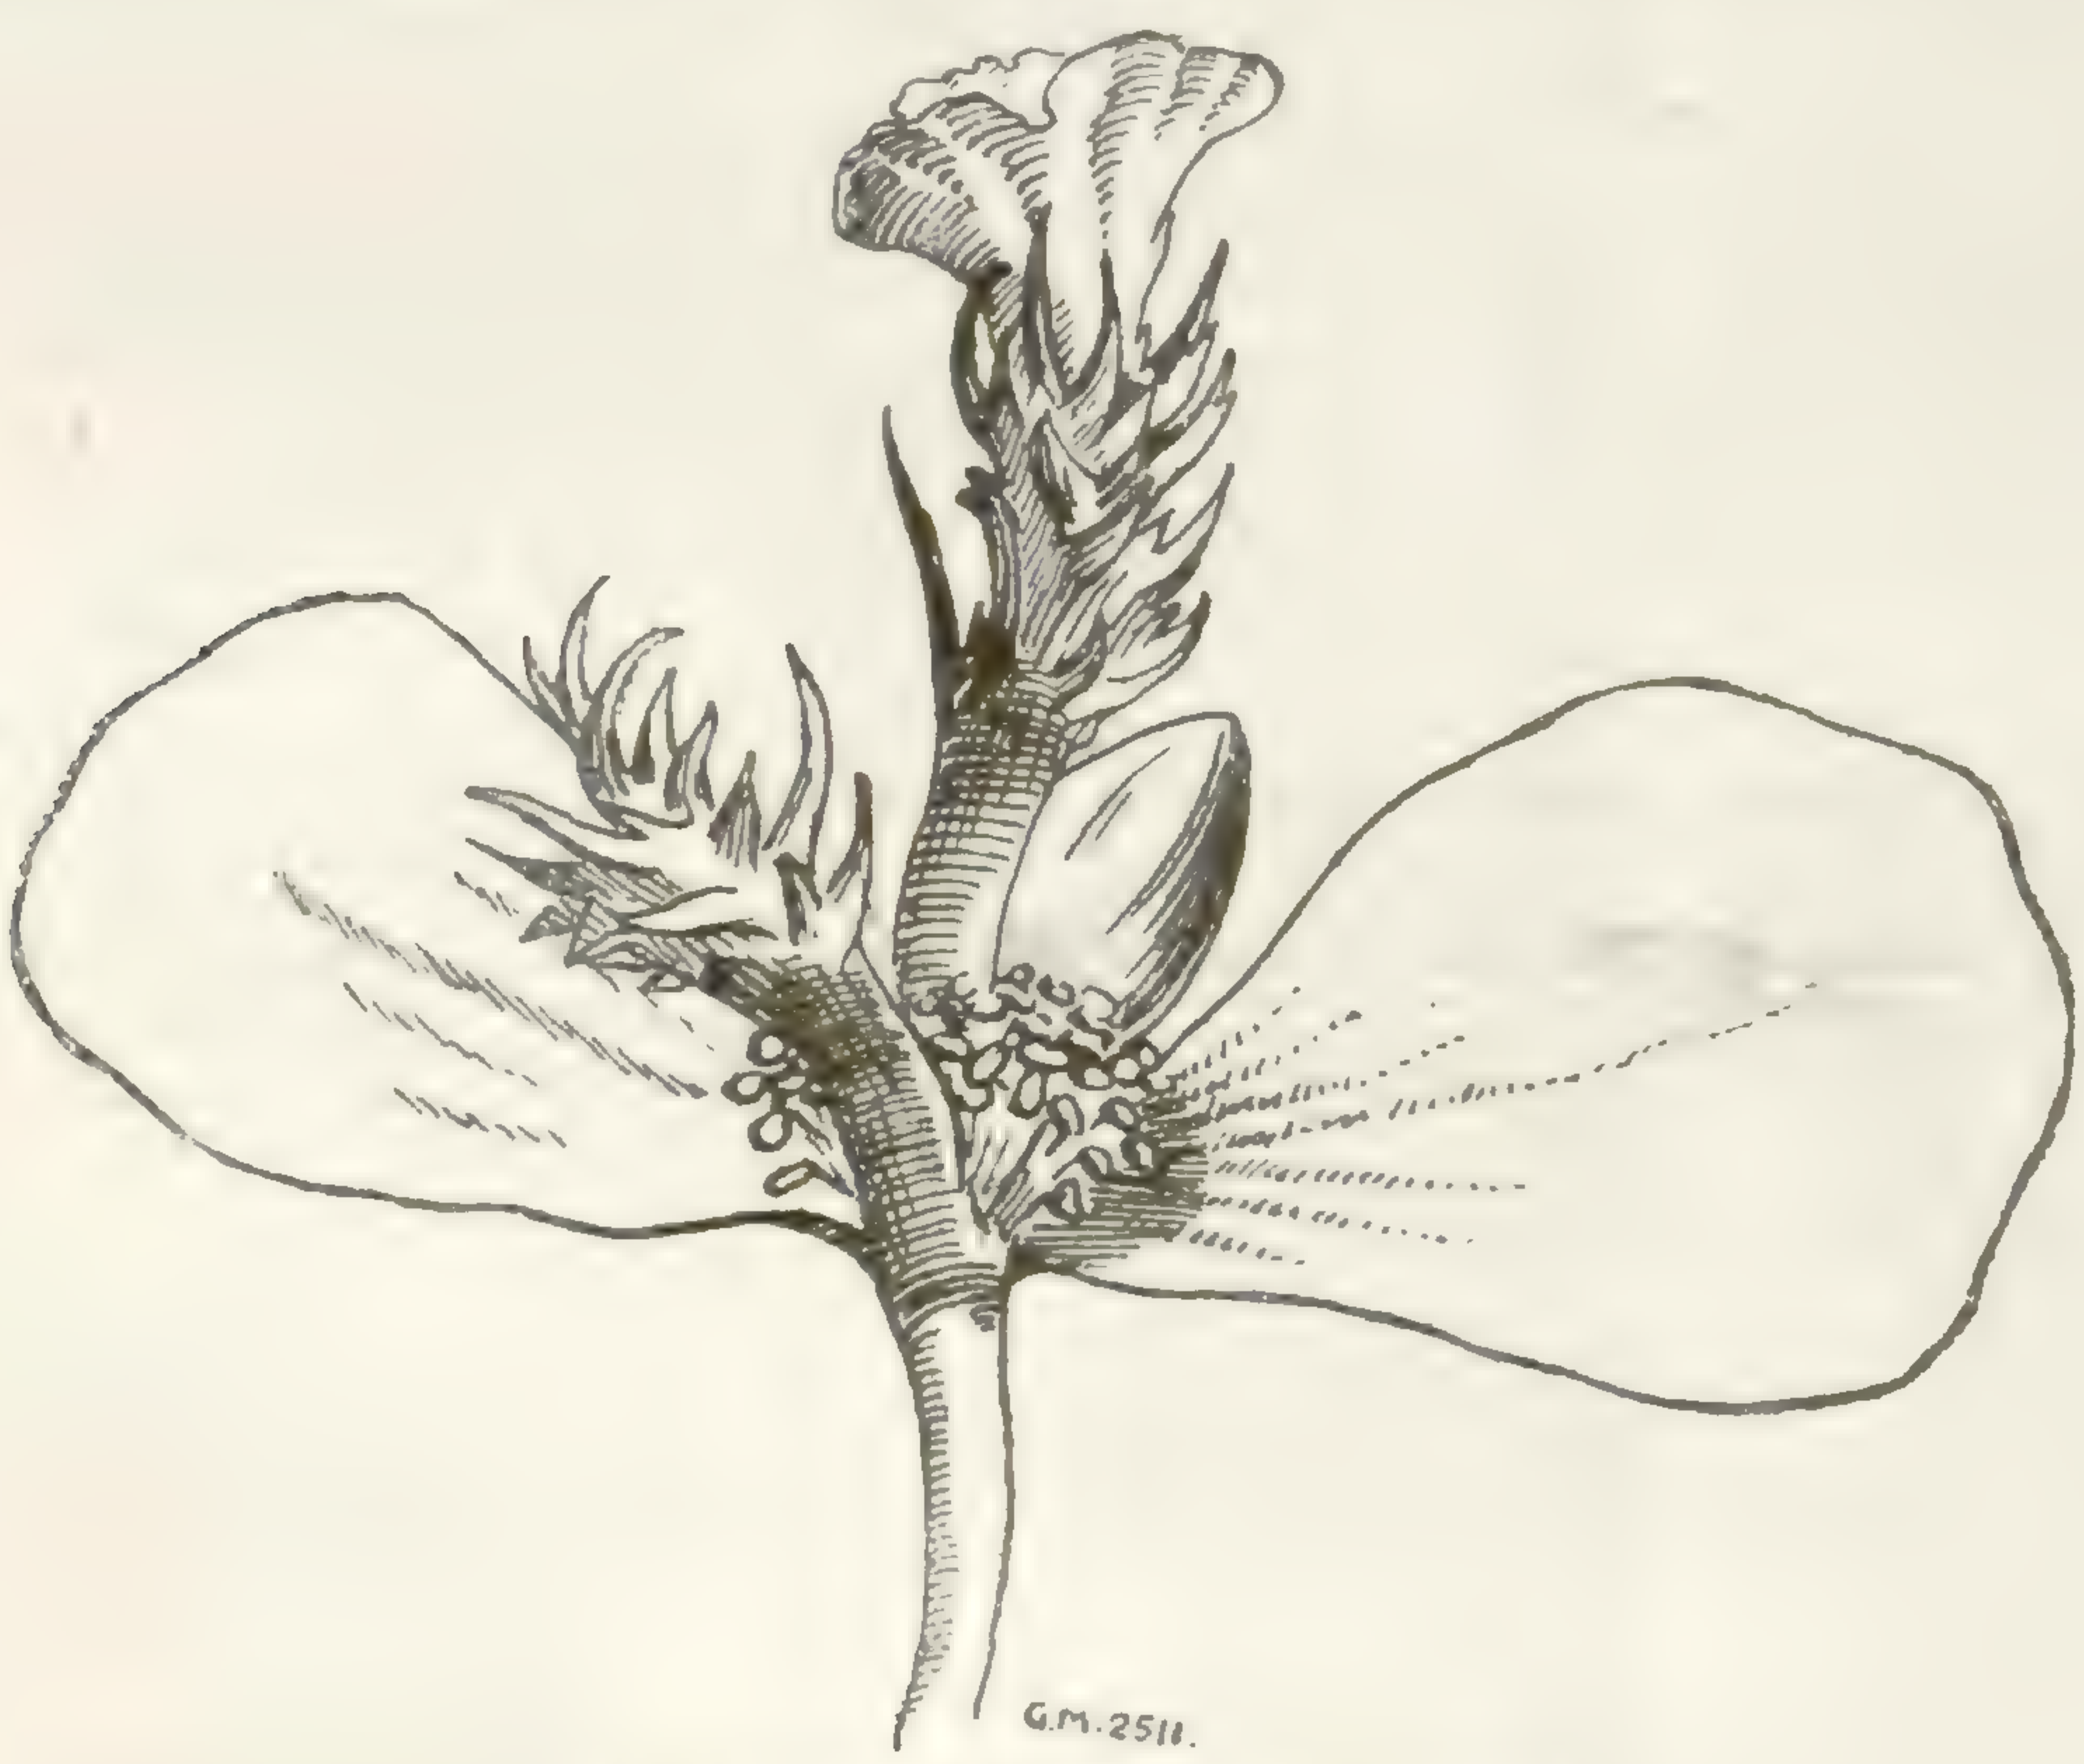
CHRYSANTHEMUM SOCIETIES.—B. L., Bedford: You will find by far the most complete list of chrysanthemum societies in the "Gardening Year Book," to be obtained post free for 1s. 2d. from the GARDENERS' MAGAZINE office, 148, 149, Aldersgate Street, E.C.

MOWRA MEAL.—A. F., Hayes: We have submitted the sample of mowra meal to one of the leading authorities on these matters, and he writes as follows: The mowra is an Indian bean which is grown for its oil. The oil having been extracted, the residue is ground, and forms the mowra meal sold as a fertiliser. We have analysed the sample sent, and find it to contain 2.38 per cent. of nitrogen, which shows it to be of small value as a manure. It is not readily soluble in water, and is entirely useless as a soil disinfectant. When employed as a fertiliser about 8oz. or 10oz. per square yard can be applied to the surface of the soil, when it should be lightly raked or dug in.

EARLY CHRYSANTHEMUMS.—Delta, Cambridge: In common with the majority of other hardy herbaceous plants, the early chrysanthemums require a moderately rich soil that has been dug to a depth of not less than twelve inches, or trenched to a depth of two feet or so. Manure from an old hotbed and well-decayed manure from the stable or farmyard are the best to use in soil preparations, but should they not be available, use superphosphate, bonemeal, or some other approved fertiliser, at the rate of about 3ozs. to the square yard. Two feet apart will be a good distance at which to plant them when growing them in beds. The best place in which to grow them in the majority of private gardens is the mixed border, where they should be arranged in groups, three or four plants being put in each. The most simple method of increasing the stock is to lift the plants in April, when the new growths are between two and three inches high, shake the soil from about the roots, and divide them into portions with about three growths attached. Then replant, preferably in fresh positions. When it is not desired to increase the stock the plants should be lifted and one portion taken off for planting, and the other part be conveyed to the rubbish heap. The best way is to renew the stock annually from cuttings, which should be taken in February or early in March, and rooted in an unheated frame. The best time to plant these will be early in May.

CUCUMBER DUKE OF EDINBURGH.—J. C. S., Wilton: The measurements of the cucumber illustrated in our issue of February 5 are those given by yourself.

MONSTROUS BEGONIAS.—H. R. A., Skipton: Something unusual or monstrous in a begonia flower does not necessarily imply beauty or a tendency toward some improvement. Curious developments should be watched, and if they suggest some new variation from the modern florists' type, the flowers should be fertilised with pollen from the same plant, and the seedlings selected that show the strongest tendency in the direction you wish to emphasise. The crested begonias and also the frilled ones have been evolved by in-breeding and selection until what was at first irregular and unbeautiful has developed into a beautiful variation. The accompanying illustration shows a very curious monstrosity in which some of the outer and attractive parts have been suppressed, and an effort has been made to combine the sexes in one flower; there are stamens and anthers, and two processes that combine some of the characters of stigma and petals.



AN ABNORMAL BEGONIA BLOOM.

TOP-DRESSING RASPBERRIES.—W. T. B., Stafford: Now that the canes have been tied into position and the plot thoroughly cleaned, a good top-dressing may be given with advantage, but heavy, wet manure should not be used. Old manure, mixed with an equal quantity of loam or old soil from the chrysanthemum pots will make a fine dressing for raspberries.

CALCEOLARIA AMPLEXICAULIS.—F. R. G., Poole: If the cuttings are thoroughly well rooted lift them carefully, and replant or pot them in light rich soil that contains old mushroom bed manure and leaf-mould. If there is ample room in a cold frame make up a bed of soil therein, and plant the cuttings firmly six inches apart each way. Failing this accommodation, pot the rooted cuttings singly in 48-sized pots, and give them a further shift into 32's later on. Keep the plants cool and sturdy, but in no sense starve them.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

H. G., Stone.—Pilea muscosa.

J. J., Wycomb.—Coleus thyrsoideus.

L. S., Godalming.—1, Primula Kewensis; 2, Grevillea robusta; 3, Cypripedium Calypso.

C. J. W., Leeds.—1, Dendrobium Falconeri; 2, Phrynium variegatum; 3, Primula floribunda; 4, Pelargonium Clorinda.

T. S. E., Streatham.—1, Callicarpa purpurea; 2, a florist's amaryllis, excellent in form, and of good colour; 3, Leea amabilis.

P. D. J., Retford.—1, Garrya elliptica; 2, Jasminum nudiflorum; 3, Arbutus unedo; 4, Diplopappus chrysophyllus; 5, Cupressus Lawsonianus.

The Sparrow in America.—This destructive bird does not appear to behave any better in the United States than in this country. It is the subject of a bulletin issued by the U.S. Department of Agriculture, and Mr. N. Dearborn, by whom it has been written, states that the English sparrow was introduced into America about sixty years ago, and is now distributed generally over the Eastern States, Southern Canada, and locally westward to the Pacific Coast. Mr. Dearborn argues that little can be said for it. It destroys small fruits and buds, and flowers of cultivated trees, shrubs, and vines. In the garden it eats ripening seeds and nips off tender young vegetables. It damages wheat and other grains, and reduces the number of America's most useful native species by destroying the eggs and usurping the nesting places. The sparrow is not protected by law, and may be killed in any manner and number, and Mr. Dearborn suggests that the birds may be got rid of by destroying their nests, baiting and trapping or shooting, and by poison.

IN THE HIGH COURTS OF JUSTICE

Edinburgh, an Action brought by CHAS. P. KINNELL & CO., Ltd., against A. Ballantine & Sons, Boness, N.B., resulted in a judgment in favour of Plaintiffs, interdicting and prohibiting the Defendants from using the words "HORSE SHOE" as descriptive of, or in connection with boilers NOT BEING OF THE PLAINTIFFS' MANUFACTURE, sold or offered for sale by the Defendants without clearly distinguishing such boilers from the boilers of the Plaintiffs.

WE WARN BUYERS AND THE TRADE THAT PROCEEDINGS WILL AT ONCE BE TAKEN AGAINST ANYONE INFRINGING OUR RIGHT.

NO BOILERS ARE

"HORSE SHOE" BOILERS

UNLESS THEY HAVE THE NAME CHAS. P. KINNELL & CO., LTD., CAST UPON THE FRONT, and buyers will protect themselves and our rights by at once intimating to us if any attempt is made to pass off as a "HORSE SHOE" boiler, any boiler not being of our manufacture.

IMITATION IS THE SINCEREST FORM OF FLATTERY, but unscrupulous traders for a little extra profit may try to pass off another boiler, which has not all OUR IMPROVEMENTS, as being "just as good."

GET A "HORSE SHOE" BOILER AND ENSURE THE BEST RESULTS.

It has taken years of experience to perfect it, and its NAME "HORSE SHOE" is the "Hall Mark" of EXCELLENCE.

Information as to any attempted infringement of our rights will be gratefully received by **CHAS. P. KINNELL & CO., LTD.** 'Phone: Hop372 (2 lines). Wire: "Kinnell, London."

Write for our List No. 30, Post Free, **"HOW SHALL I HEAT MY GREENHOUSE."**

. . AND . .

MANY FINE ILLUSTRATIONS.

TO ADVERTISERS:—Our Spring Number is invariably the largest and most interesting and important issue of the whole year. It offers the best possible opportunity to advertisers, and as the best positions are always in great demand, it is important that space should be secured without delay.

Offices: 148 and 149, ALDERSGATE STREET, LONDON, E.C.

CATALOGUES RECEIVED.

JOHN FORBES, LIM., HAWICK.—A catalogue devoted chiefly to hardy flowers, and especially to florists' varieties of hardy flowers; a useful reference book.

W. BAYLOR HARTLAND AND SONS, CORK.—Vegetable and flower seeds are included in this list and there are some novelties, including the new Claddagh potato.

R. GILL AND SONS, TREMOUGH, PENRYN, CORNWALL.—An interesting and beautifully illustrated catalogue of rhododendrons, chiefly Himalayan species and their hybrids, and choice trees and shrubs. Some of the illustrations previously appeared in our columns; others show rhododendrons at Tremough and in the Himalayas.

J. W. CROSS, OLD GRAMMAR SCHOOL, WISBECH.—A striking catalogue printed in blue with red cross headings. Seed potatoes are given great prominence.

FRANK DICKS AND CO., DEANSGATE, MANCHESTER.—A comprehensive catalogue of vegetable and flower seeds, together with bulbs and roots for spring planting.

JONES AND SON, LIM., SHOPLATCH, SHREWSBURY.—A freely illustrated list devoted wholly to sweet peas.

JOHN R. BOX, DERBY ROAD, CROYDON.—A general catalogue in which special attention is given to sweet peas, begonias, and sundries.

W. WELLS AND CO., LIM., MERSTHAM, SURREY.—A handy descriptive catalogue of chrysanthemums, phloxes, Michaelmas daisies, pentstemons. A separate and illustrated list is devoted to chrysanthemum novelties.

H. J. GASSON, RYE, SUSSEX.—A catalogue of garden netting, tents, waterproofing, boots, leggings, rugs, tarpaulin, rick covers, etc., etc.

J. F. WILLIAMSON, MALLOW, Co. CORK.—A list of Irish-grown seed potatoes, including some novelties.

ANT. ROOZEN AND SON, OVERVEEN, HAARLEM, HOLLAND.—Catalogue of choice bulbs for spring planting, and of vegetable and flower seeds.

THE RELIABLE SEED AND BULB CO., WEST BROMWICH.—A well arranged and freely illustrated catalogue of vegetable and flower seeds, in which is also given a selection of bulbs that can be successfully planted early in the year.

Index to the "Gardeners' Magazine," 1909.—Those readers who have preserved the 52 numbers of the GARDENERS' MAGAZINE for 1909 with a view to having them bound for future reference, can obtain Handsome Cloth Binding Cases from the publishers, 148 and 149, Aldersgate Street, London, price 2s., post free. The index, with title page, is now ready—price 2d., or by post 2½d. The volume bound complete will also be ready in a few days, price 12s. 6d., by post 13s. 4d.

SOW NOW UNDER GLASS.

SUTTON'S PRIZETAKER LEEK.
Per packet, 1s. 6d. and 2s. 6d., post free.
Mr. W. Robertson, gardener to M. Stocks, Esq., writes: "There are no Leeks to come up to your Prizetaker for beauty and size. They have leaves as broad as a man's hand, and stems from two to three times the size of others grown in this district."

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

NOW IS THE TIME TO PLANT Kelway's beautiful Blue Delphiniums, in borders and beds; as clumps on the lawn, and at the sides of carriage drives. There is no hardy flower more stately and of lovelier shades of BLUE—that precious colour in the garden.
We recommend the following named collections:—
Collection B, 15s. a dozen; 100 for £5 10s.
Collection D, 34s. a dozen; 3s. each plant.
KELWAY and SON, Langport, Somerset.

KELWAY BORDERS.
A perfect picture in your garden to last for years will be the result if you allow us NOW to plan a scheme, whether of contrasts or of harmonies. Our "Artistic" Border, 50 yards by 10ft., costs £12 10s. only.
Consider what is "saved" in heat and labour by this system, and what is gained in true beauty.
KELWAY and SON, The Royal Horticulturists, Langport.

FIDLER'S NEW ILLUSTRATED CATALOGUE of CHOICE GARDEN SEEDS will be sent, post free, to any address on receipt of postcard. Write at once for a copy. It may help you to save 50 per cent. on your seed bill this season.

THOMSON'S CELEBRATED MANURES.
For full advertisement see page ix.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

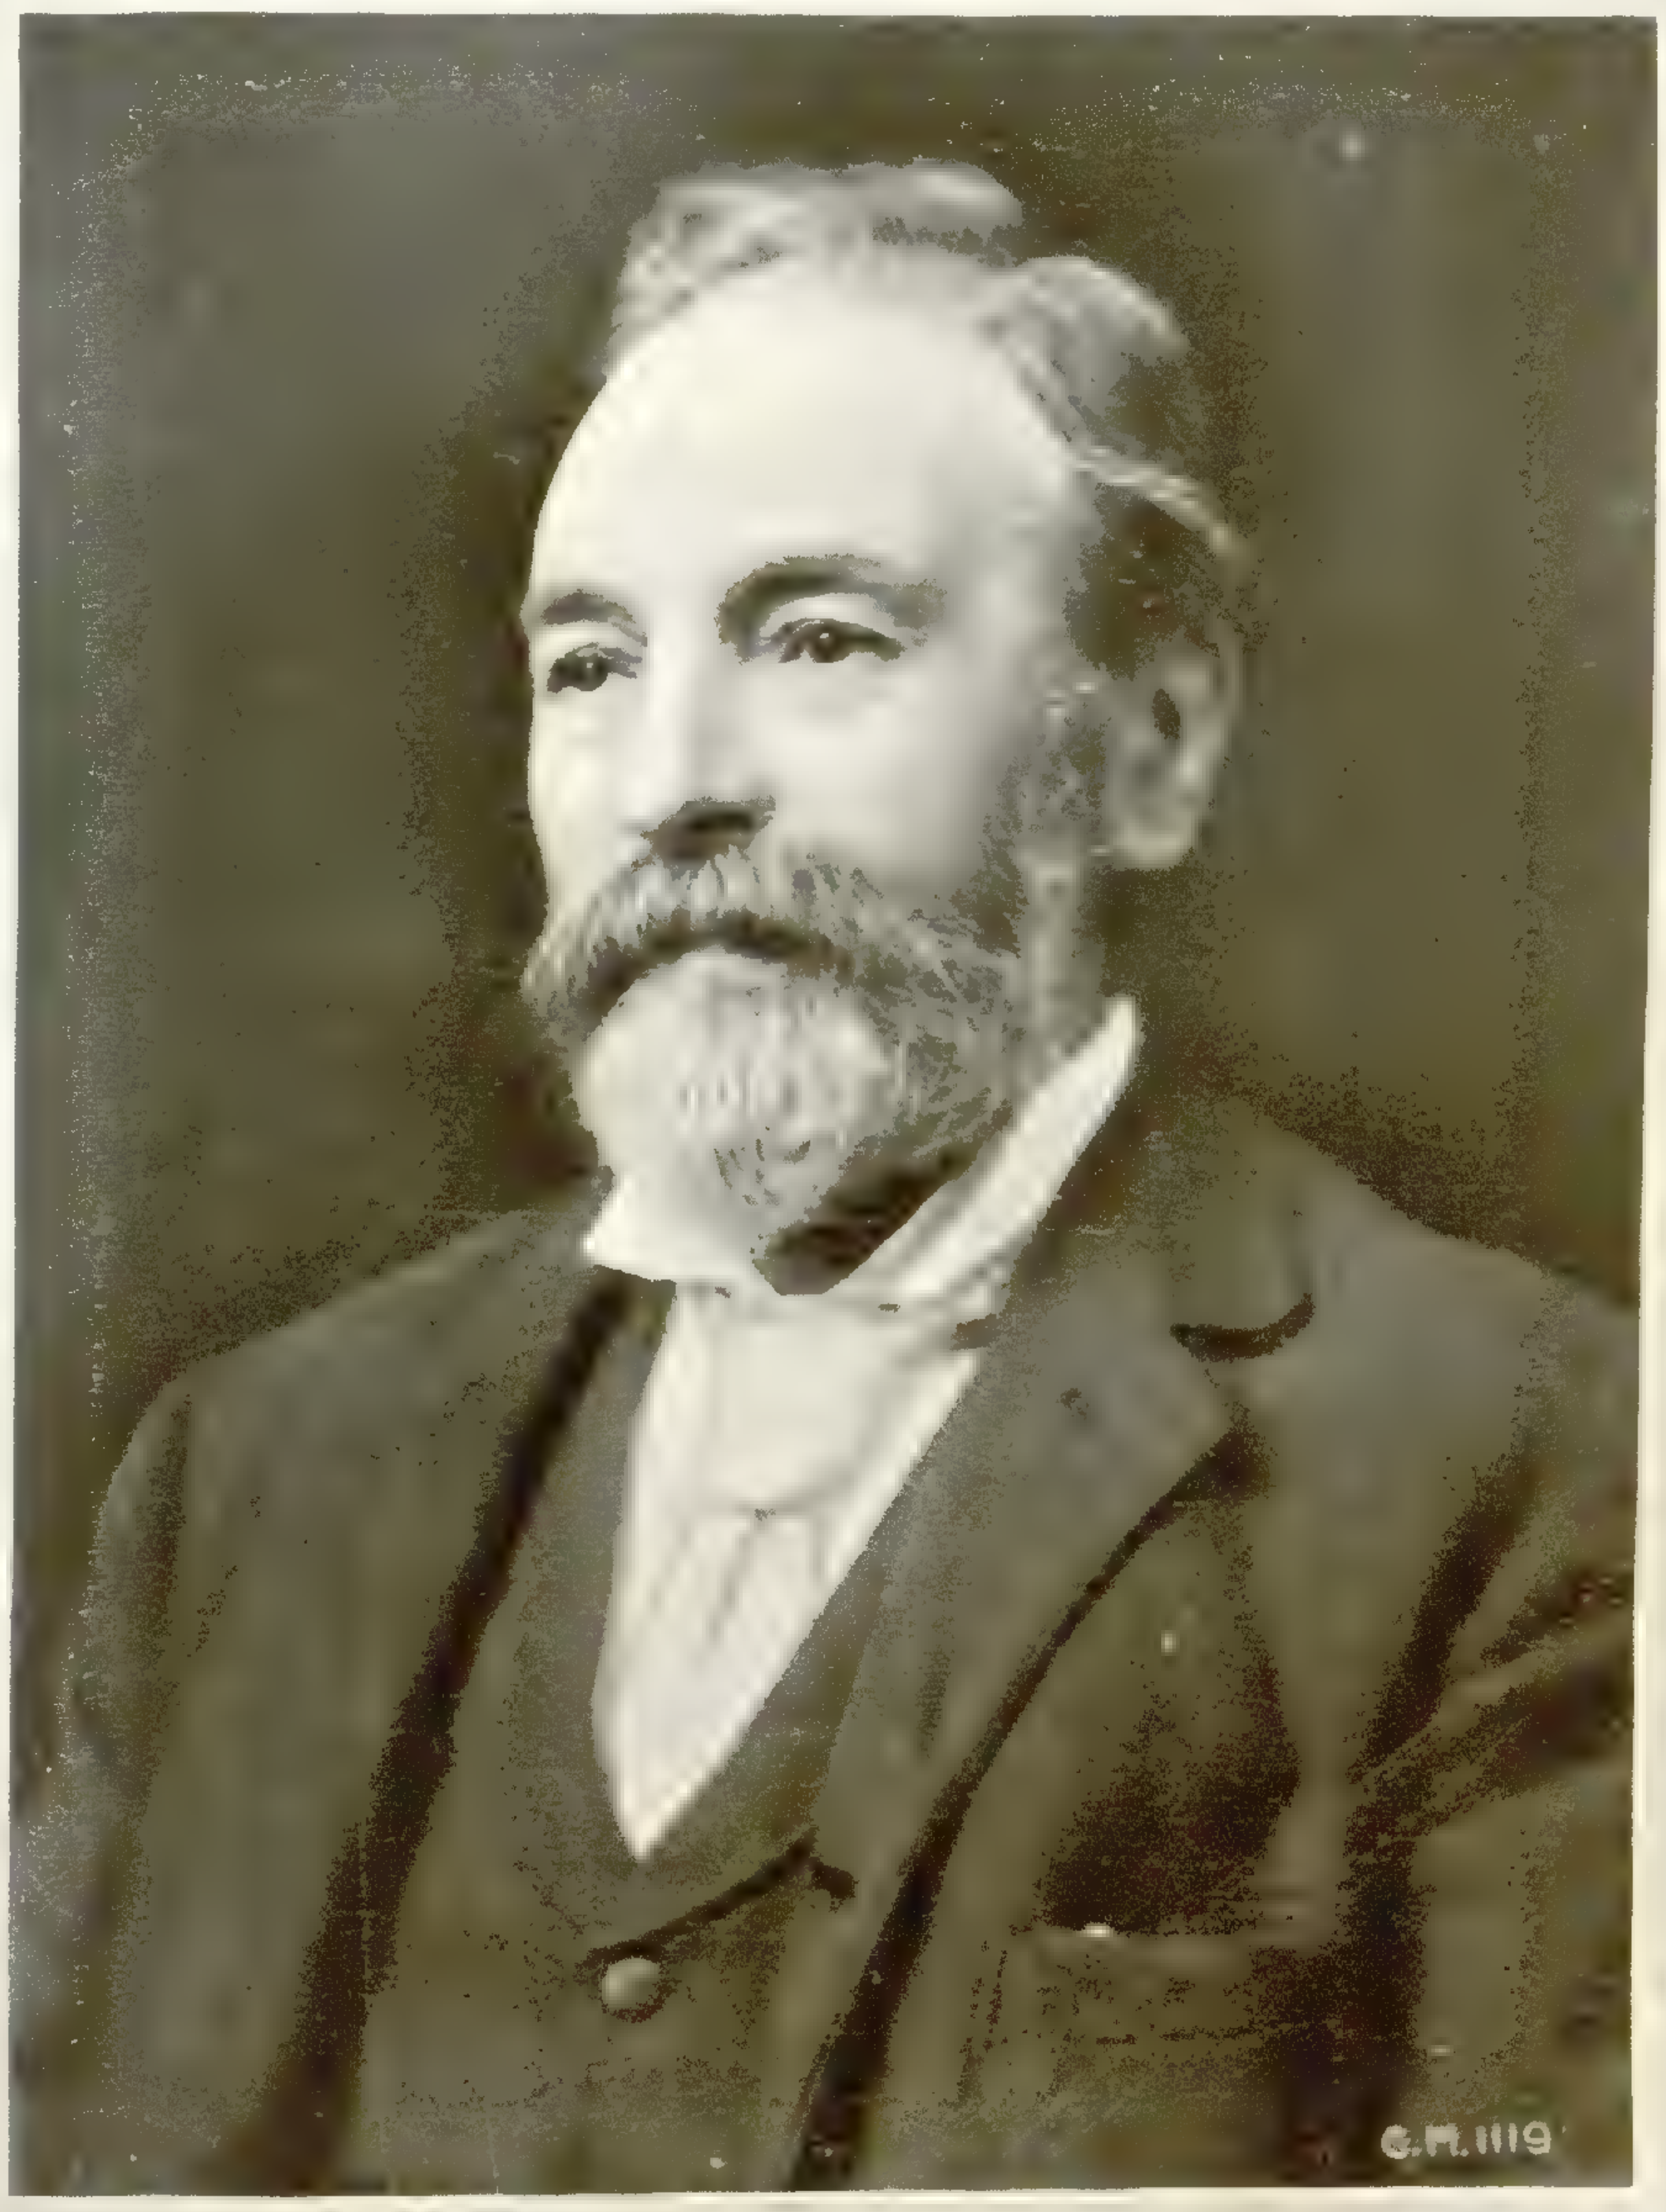
NOTES OF THE WEEK.

The Superintendence of London Parks.



MR. C. DIXON.

To the majority of our readers it will appear as passing strange that there should be any difference of opinion with regard to the qualifications that should be possessed by those who are entrusted with the charge of the parks and gardens of great cities or towns of the first magnitude. They will, and not without good reason, assume that the officer should have a practical knowledge of the work that has to be accomplished in the conversion of a tract of land, agricultural or otherwise, into a place of recreation for the public, either as a beautiful garden or a playing field. They will also recognise the necessity of a knowledge of the art of design in relation to open spaces, and of a thorough knowledge of the various classes of trees and shrubs, and of tender and hardy plants, that can be the most successfully utilised in the creation of garden scenery, and especially in districts in which the conditions are so unfavourable to plant life that only a small proportion of the trees and shrubs available will thrive. In other words, they will consider that the qualifications should be such as those only can possess who have had a thorough training in the several branches of scientific and practical horticulture. With those who hold such views we are, it is hardly necessary to say, in full agreement. The necessity of placing the Parks Department of a city or town under the charge of an experienced horticulturist, who, at the same time, is a gentleman and a man of business, is so obvious, that it is well nigh inconceivable a public body such as the London County Council should have elected by a substantial majority as the Chief Officer of its Parks Department a military man, who, it would appear from the discussion at the Council meeting when the appointment was made, did not claim to be fully versed in the art of gardening. That he had shown remarkable ability in the discharge of his military duties, and achieved much success in his vocation there can be no doubt, but that does not affect the question at issue. The London County Council had in their advertisement inviting applications for the post stated that, "The person appointed will be responsible for the laying out and proper management of the conservatories and the horticultural and other buildings therein, and for the management and discipline of the staff employed in the parks service." Here we have evidence that at the outset the Council had in view the advisability of the successful candidate having an acquaintance with horticultural matters. We have a further proof of this in the paragraph in the advertisement, which stated that, "A knowledge of surveying, landscape gardening, forestry, and horticulture is desirable." Yet, having stated that the officer appointed would be responsible for the management of the horticultural buildings, and that it was desirable he should have a knowledge of landscape gardening, forestry, and horticulture, the Council passed over the claims of the candidates who had obtained eminence in horticulture. It was stated in the course of the discussion that the Council did not want a gardener, but an officer who could supervise the large staff engaged in the Parks Department; but, it should be hardly necessary to point out that a thorough acquaintance with the science and practice of horticulture does not preclude the possession of administrative ability of a high order. So far from this being the case, the most highly trained and successful gardeners have invariably the most efficient control over their staff. If we require proof of this, in relation to public parks, we have only to point to the extensive parks and gardens at Cardiff, Edinburgh, Glasgow, Leeds, and Liverpool, all of which are in charge of gardeners. There are others, but the mention of these will suffice for our present purpose, especially as they are well known for the efficiency that is evident on all sides. It should be remembered that all the more important of the magnificent open spaces which are under the authority of the London County Council were designed and planted by gardeners, and only those who know something, by repute or otherwise, of the original sites can fully appreciate the magnitude of the task or the success achieved in its accomplishment. When Victoria Park, Battersea Park, and some other of the great open spaces were about to be formed, the authorities did not engage officers in the army or navy to design and plant the areas. They engaged gardeners of known ability, with the result that we have parks so beautiful that the citizens of London have good cause to be proud of their possessions. If it was advisable to entrust the formation of these parks to gardeners, it is certainly not less desirable they should be under the control of a gardener who, by his accomplishments, has shown his fitness for the post. It is not sufficient that the superintendents of the respective parks are gardeners, the chief officer should be one also, so that he may be in a position to advise, when advice is needed, on difficult points; to see that such improvements as may be necessary are carried out on proper lines, and, what is certainly not less necessary, be in a position to appreciate the difficulties under which gardening is carried on amid unfavourable surroundings. The London County Council has shown such a singular want of appreciation of its responsibilities in this matter as to have given rise to much criticism; and the council of the British Gardeners' Association has passed a resolution expressing its disapproval of the appointment of a military officer as chief of the Parks Department, instead of a properly qualified gardener, and with this protest we cordially agree.

Mr. Charles Dixon, head gardener to Mary Countess of Ilchester, has charge of the famous Holland House Gardens, Kensington, gardens that have become very well known in recent years because of the Holland House exhibitions, held in an adjoining meadow, the gardens being opened to the visitors on payment of a small sum. The amount thus received has always been given to a deserving charity, and the Royal Gardeners' Orphan Fund and the Gardeners' Royal Benevolent Institution have benefited materially from this source owing to the kindness of the Countess and her late husband. Mr. Dixon was apprenticed at Rossie Priory, Perth, and following his apprenticeship he gained experience at various gardens in Scotland, and presently became foreman at Belton House, Lincolnshire, where he remained five years. The following two years he spent with Messrs. Lee at their Hammersmith Nursery, and acted as pot-vine grower; and while there he was the first to discover the Phylloxera on the vine leaves. In 1864 he entered the service of the late Lady Holland, at Holland House, and at her death was engaged by the late Earl of Ilchester at the same gardens; and he is now serving Mary Countess of Ilchester, and has been continuously in the service of the family at Holland House for forty-five years—a splendid record. Mr Dixon's abilities as a gardener are well known, and they are exerted under the none too favourable conditions obtaining in busy West London. Mr. Dixon is modest to a fault, a quiet man, ready to discuss any horticultural matter, but not his own doings. Mr. Dixon is one of the veterans, and very few people would imagine him to be well over three-score years and ten. He is a member of the Royal Horticultural Society's Floral Committee, and of the committee of the Royal Gardeners' Orphan Fund, and in both bodies his ripe experience is highly valued.

Retirement of Mr. John Wright.—After eighteen years of strenuous work on behalf of the Surrey County Council in the extension of horticultural science and practice, Mr. John Wright, V.M.H., has retired from the position of Chief Instructor in Horticulture for the county. So many of the masters and teachers in the Surrey schools have been associated with Mr. Wright in his work that it was fitting they should give him some expression of their regard, and this they did recently, presenting the veteran horticulturist with a handsome illuminated address, in which, among other things, they state: "We rejoice that you should have been appointed the first Horticultural Superintendent in Surrey, the pioneer county in school horticulture. We fully recognise the fact that it was due to your expert knowledge and great personal influence that the establishment and systematisation of school gardens were so successfully carried out in the county, that Surrey has always been recognised as holding the premier position in school gardening. We also desire to offer you our hearty good wishes, and hope that there may be many years of health and happiness for you in your retirement."

Our Spring Number.—Our next issue, dated February 26, will be the Gardeners' Magazine Spring Number, and it promises to exceed all previous issues of a similar character both in usefulness and interest. The number will be enlarged, and freely illustrated throughout. Chief among the many subjects to which special attention will be directed are the "Making of a Large Rock Garden," "Rockeries for Small Gardens," "Alpine Pinks," "Columbines," "Borders of Annuals," "Seed Sowing on Clay Soils," "Summer Crops of Tomatoes," "Preparation of Vegetables for Exhibition," "Summer Salads," "Vegetable Marrows," "Runner Beans," "Evergreen Dendrobiums," "Zonal Pelargoniums," and "Annuals for the Conservatory." These are sufficient to show the varied character and wide interest of the contents, but we would add further that the contributors to the special issue include Messrs. Charles Foster, G. Gordon, V.M.H., E. Beckett, V.M.H., T. B. Field, H. J. Chapman, T. Slade, Walter Irving, Thomas Coomber, P. S. Hayward, J. C. Newsham, S. Arnott, Thomas Stevenson, and W. Hedley Warren, all of whom are well known to our readers. As we anticipate a big demand for this issue, those requiring extra copies should communicate with the publisher as early as possible to prevent disappointment.

Shrewsbury Floral Fete is to be held on August 17 and 18 next. This will be the thirty-sixth show, and if the great attractions of the new schedule count for anything the display will be as fine as ever. Besides cups and medals, the sum of £1,100 is offered in cash as prizes, in a total of 200 classes. We notice that the leading seed firms are again offering substantial prizes for collections of vegetables grown by their customers. Fruits, cut flowers, and plants are splendidly catered for, and great interest will centre in the dessert table and leading grape classes. A special new class is for a display of indoor and hardy flowering plants and flowers, cut and growing, the whole to occupy a space of 250 square feet. All cut flowers must be in water, and the exhibitor is expected to produce a novel and artistic exhibit. This takes the place of the old class for a group of foliage plants, and the prizes are, in order: Large gold medal and £20; small gold medal and £15; silver-gilt medal and £12 10s.; and £10. The judges will be instructed to consider quality, general attractiveness to visitors, and novelty in arrangement, and it is hoped the class will be the means of bringing forward some really attractive groups of novel interest.

Visitors to Kew in 1909. — From the official publications of the Royal Gardens, we learn that 3,360,221 visitors to the Royal Botanic Gardens were recorded during the past year. These figures show an increase of 397,507 over those for the year 1907, which up to the present were the largest numbers on record. During the last ten years (1899-1908), 17,861,093 persons visited the gardens, giving an average of 1,786,109. The total number of visitors on Sundays during 1909 was 1,384,369, and on week-days 1,975,852. Sunday visitors have increased by 62,985; in this connection it is of interest to notice that until the year 1907 visitors to the gardens on Sundays had only on three occasions exceeded 700,000. The number of visitors on week-days shows an increase of 281,639 over the previously-recorded maximum in 1907. The greatest attendance on any one day was 103,895 on Whit Monday, May 31. The smallest number on any one day was 191, on November 29. The largest and smallest Sunday attendances were 71,584 and 492 respectively, and in the former figures a slight increase has occurred.

The B.G.A. and the London Parks Appointment.—The following letter of protest has been sent to the clerk of the London County Council by Mr. J. Weathers in connection with the recent appointment of a soldier to the post of chief officer of the parks department: "Sir,—I am directed by the Executive Council of the British Gardeners' Association to forward the following resolution, and to ask that you will kindly call the attention of your Council to it at their next meeting: Resolved, 'That this meeting of the British Gardeners' Association in Executive Council assembled, desire to express their strong disapproval of the appointment of a military officer to the post of chief officer of the parks department, instead of a properly qualified gardener, possessing the requisite technical knowledge and powers of organisation and control.'"

Forestry Exhibition at Liverpool.—At the recent meeting of the Royal Agricultural Society proposals were submitted for a plantations competition, on somewhat similar lines to that held in connection with the Gloucester Show of last year. It was decided that, if sufficient financial support were forthcoming, a competition, confined to the districts of Lancashire, Cheshire, and North Wales, should be carried out for plantations under varying conditions—namely (1) growing on a rich or growing on a poor quality of soil, (2) mixed or unmixed, (3) conifers or hardwoods, (4) from five to thirty years from date of planting. The forestry exhibition to be held in connection with the Royal Show at Liverpool will be on the same general lines as that at Gloucester last June.

Botany at the British Association.—At the meeting of the British Association, to be held at Sheffield, on August 1 and following days, Professor T. G. Bonney, F.R.S., will preside. The president of the Botany Section is Professor J W. H. Trail, F.R.S., while Professor A. P. Coleman has charge of the Geology Section, and Dr. Herbertson of the Geography Section.

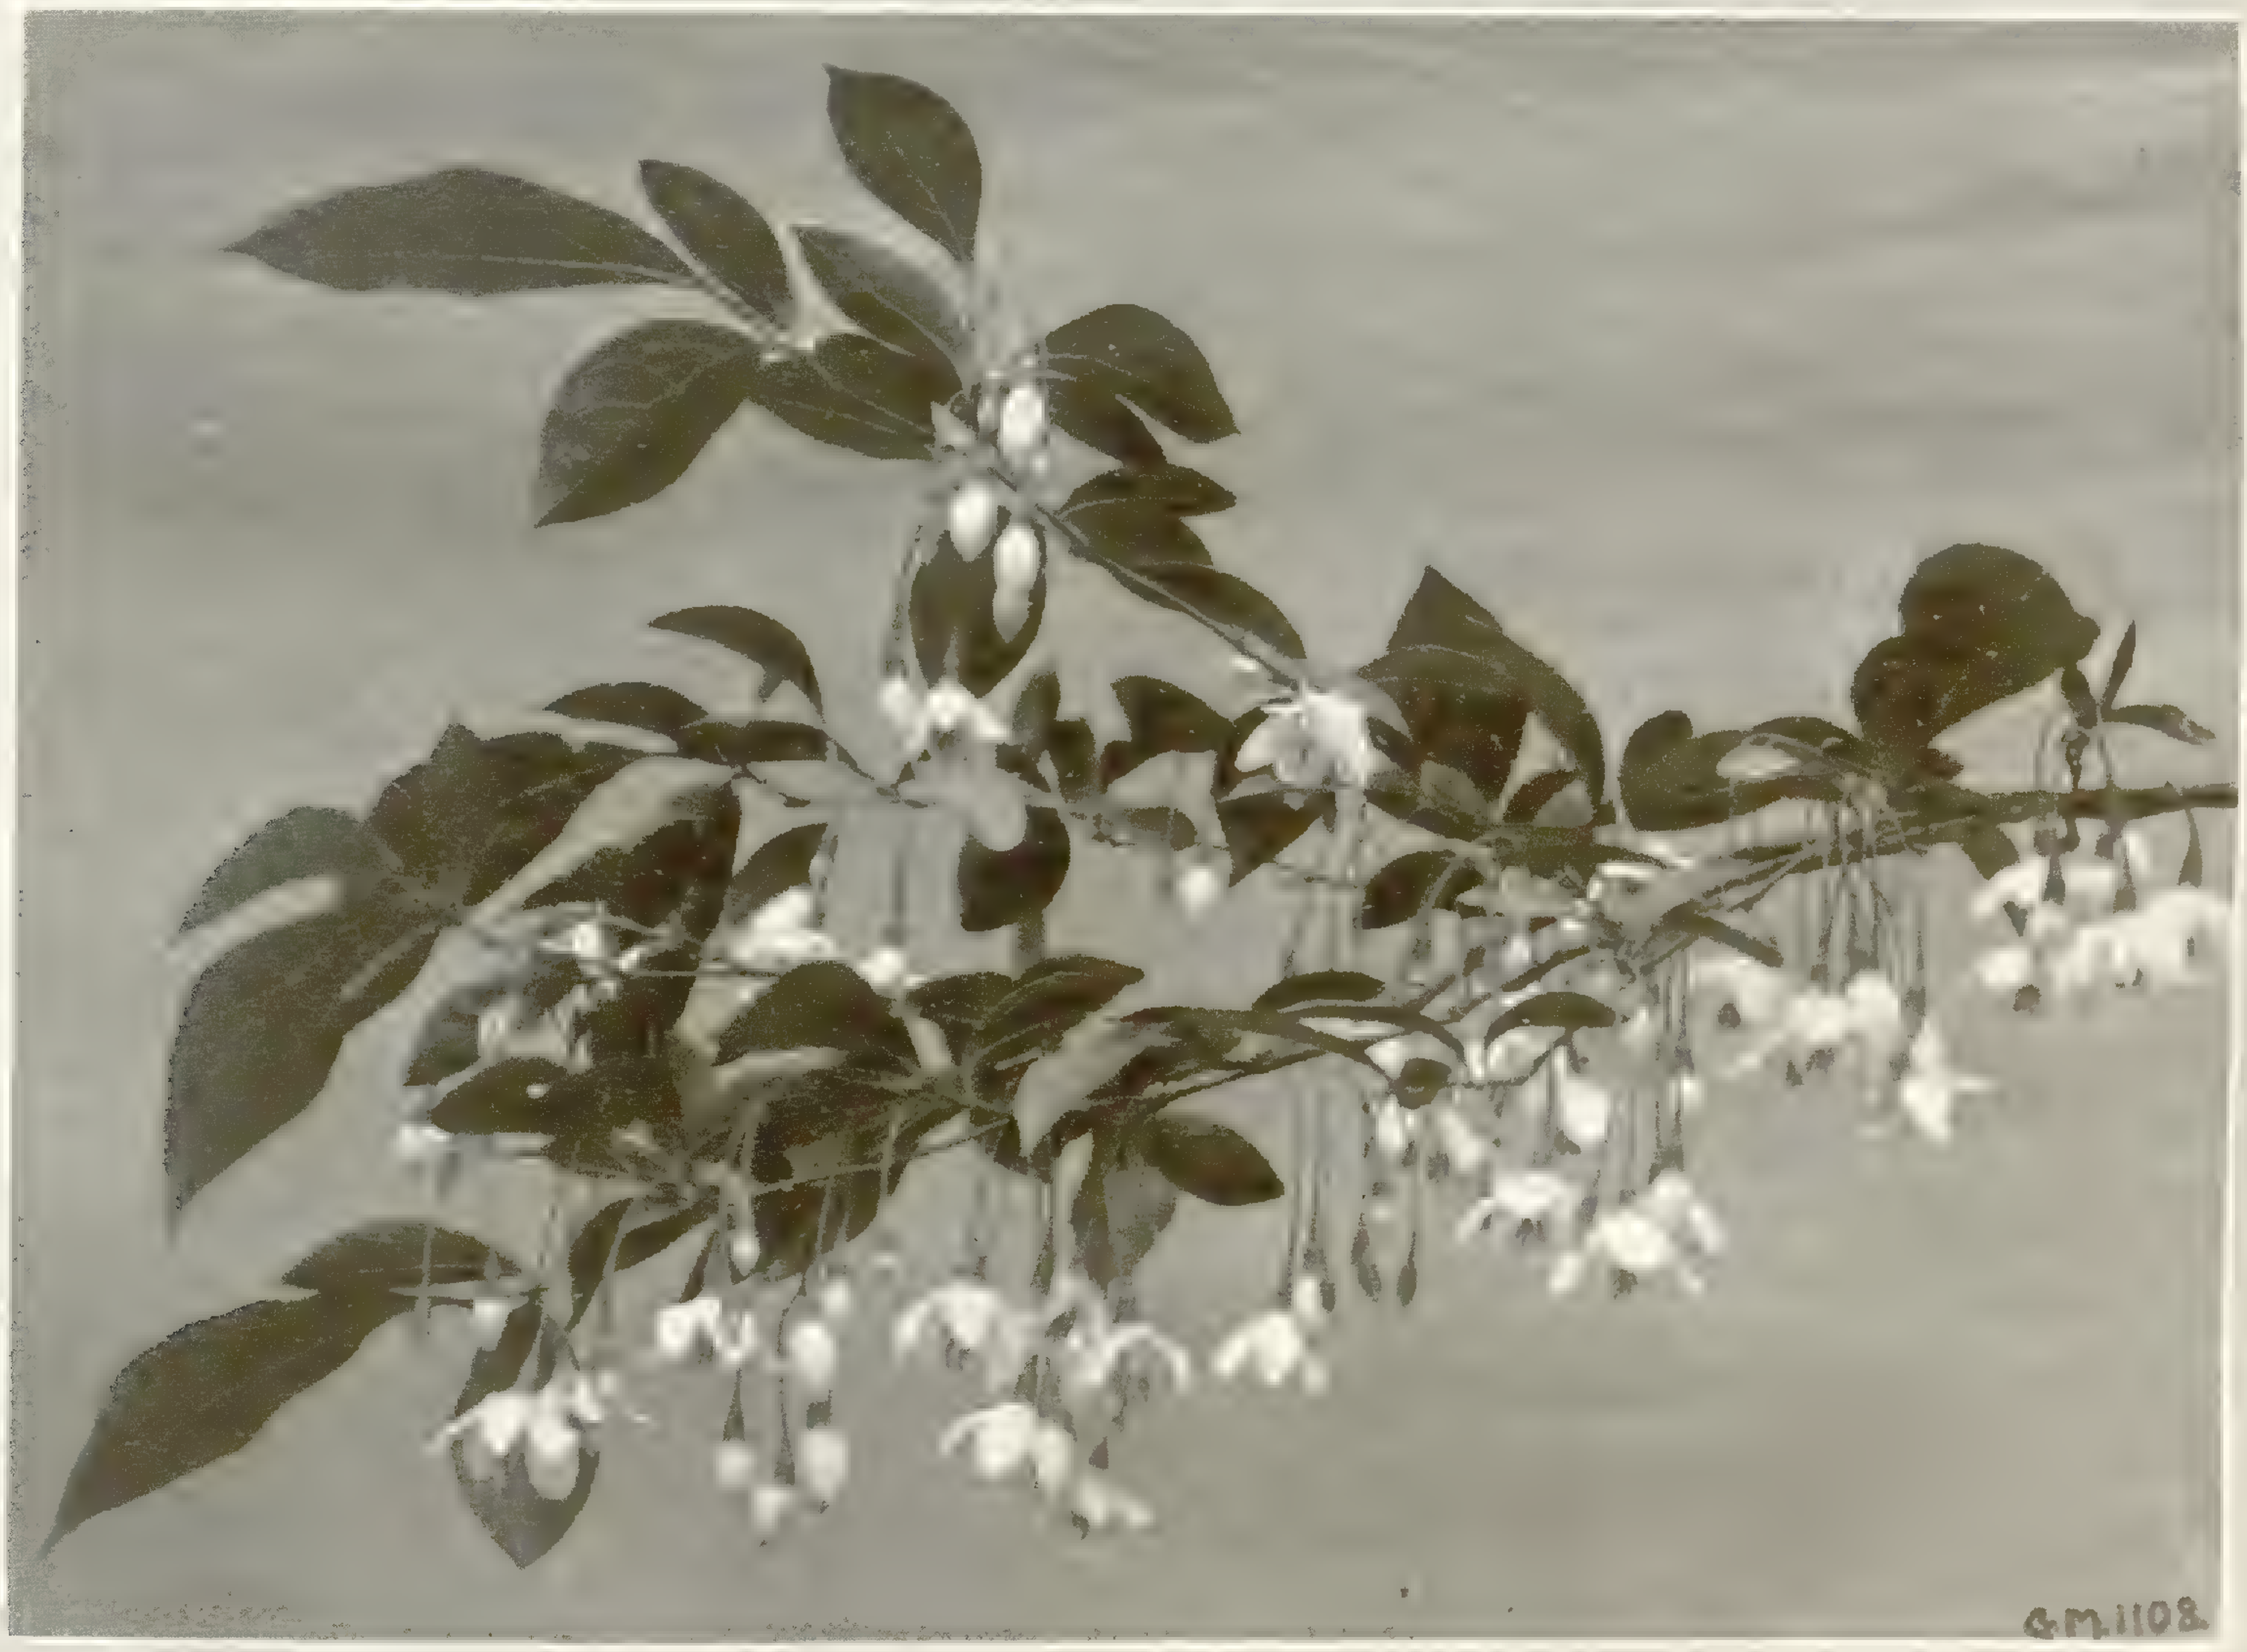
British Gardeners' Association.—The following "open letter" is being circulated to candidates for the London County Council by the Executive Council of the British Gardeners' Association: "Dear Sir,—I am directed by the Executive Council of the British Gardeners' Association to ask if, in the event of your election to the London County Council, you will be good enough to use your influence to secure the following recommendations of the British Gardeners' Association, viz., (a) To secure a minimum wage of 30s. per week for those gardeners employed by the London County Council who can produce the credentials of the British Gardeners' Association as to their being duly qualified gardeners. (b) To secure an alteration of the system which allows the appointment of a military officer to the post of chief officer of the parks department—an appointment which, in the opinion of the Executive Council of the British Gardeners' Association, should be held by a properly qualified gardener possessing the requisite knowledge and powers of organisation and control.—Yours faithfully, John Weathers, General Secretary.

THE JAPANESE STORAX.

The genus Styrax is a comparatively large one, but of the sixty or more species known to science very few are in cultivation in this country, and of these the most meritorious are unquestionably Styrax japonicum and S. Obassia, both of which are natives of Japan.

The first-named, of which an illustration is given herewith, is usually a free-growing shrub, ranging from nine to twelve feet in height, but under exceptionally favourable conditions it assumes the form of a small-growing tree, and rises to a height of twenty or more feet. It has an elegant habit, with medium-sized deep green leaves, and produces early in the season of summer a profusion of pure white campanulate pendent flowers, which are delightfully fragrant. Some idea of the beauty of a well-developed specimen during its season of blossoming will be obtained from the illustration of a spray that accompanies this note. S. Obassia is a small-growing tree, remarkable alike for its handsome rich green leafage and its elegant racemes of pure white flowers. The racemes are terminal, and range from six to eight inches in length, and bear twenty or more of the elegant campanulate blossoms, which, as in the case of those of the first-named species, are fragrant.

Both species fully merit a place in gardens in which trees and shrubs remarkable for the beauty of their flowers receive attention, for they are distinct and elegant, remarkably attractive, require but little space, and can be successfully grown without any great difficulty. A well-drained and moderately light soil is the one best adapted to their requirements, and where the soil is close in texture it can be readily improved by the addition of turfy loam, leaf-mould, and coarse grit. They may be planted singly or in groups in the shrubbery border, or in small groups on the lawn. The latter are preferable as the plants enjoy to the full both light and air, and are free from the risk of being injuriously crowded by stronger-growing neighbours. When planted in the shrubbery border care must be taken to select positions where the soil is not filled with the roots of strong-growing trees, and where they will have the space necessary for their full development. G. G.



[Photo: C. P. Raffil.

THE JAPANESE STORAX (STYRAX JAPONICUM).

A handsome shrub or small tree bearing a profusion of fragrant white flowers.

PERPETUAL CARNATIONS.

One cannot help noting the remarkable advance among perpetual carnations since the "seventies." Those old varieties, with their casual blossoms, which found favour in several good establishments, such as Jean Bart, Boule de Feu, and Valiant, scarlets; Oscar and Prince of Orange, yellows; Mont Blanc, Avalanche, and White Nun, whites; Maiden's Blush, blush; Diana, bright rose; and those fancy varieties, Ascot Giant, Beauty, and Brilliant, are now replaced by a fine reliable race of healthy perpetual-flowering varieties, which are of immense service for rendering a supply of beautiful blossoms at all seasons, but more especially during the winter and early spring months.

Some varieties, having once achieved wide popularity, retain their position in spite of the many changes around them. Of such are Mrs. T. W. Lawson, Enchantress, and a few others which follow those two favourite types. A word in reference to these two types may be of service. Mrs. Lawson, with all its sports, should be given a winter temperature of 55 degrees by night and 58 degrees to 60 degrees by day, or as near as possible to these figures, while the Enchantress group will be found to do best if allowed about five degrees less.

Some varieties seem to do better in certain districts than others, and it may be early yet to say which of the latter-day varieties will hold high rank. Winsor, of course, has an assured future, and I certainly consider Afterglow will occupy a strong position for a good long time to come. Aristocrat I am not so sure of, but it is certainly fine when well grown. My Maryland seems to be gaining ground among the whites, and Georgia is also deserving of note. Improved White Lawson, White Enchantress, Lady Bountiful, and White Perfection still have a good following, and probably one may regard the idea that the premier white is yet to come. Sarah Hill is also very fine, and should be included in a list of representative whites.

Scarlets are even now a very undecided quantity, and it is early to predict the coming premier. Beacon is bright and free, but it is not quite so popular as I expected it would become. Victory is good for size and colour, but hardly free enough for private establishments. Andrew Carnegie does not seem as yet fully known, and though it is regarded as the Scarlet Harlowarden, it does not seem as though it would equal the popularity of that first-rate crimson, while Britannia is hardly so good as its leap into popularity indicated. The front rank among crimsons is still held largely by Crimson Glow, The President, Harlowarden, and the newer Carola, of Engelmann.

I do not know if Nelson Fisher is in much demand now, probably not, though its dwarf, sturdy habit makes it a good pot plant; it is bright rose in colour, and is now supplemented by the new American sport, Red Nelson Fisher, a bright, telling form evolved from the type. President

Taft is regarded by some American growers as a coming red, but this remains to be proved.

A statement regarding some of the newest American varieties may perhaps be of service. Messrs. F. Dorner and Sons, introducers of many good carnations, are putting forward Scarlet Glow as the premier novelty for 1910; this was first shown in quantity at Indianapolis about a year ago, but the firm in question have subjected the variety to a good testing since it was raised in 1905. It is a good bright scarlet, very free, and early to blossom, of good healthy constitution, and the flowers keep well. A new scarlet recently registered is Red Prince, a continuous flowering variety, which maintains its form and good colour even during hot weather; its size is good, averaging from three to three and a-half inches, and the calyx firm and non-bursting.

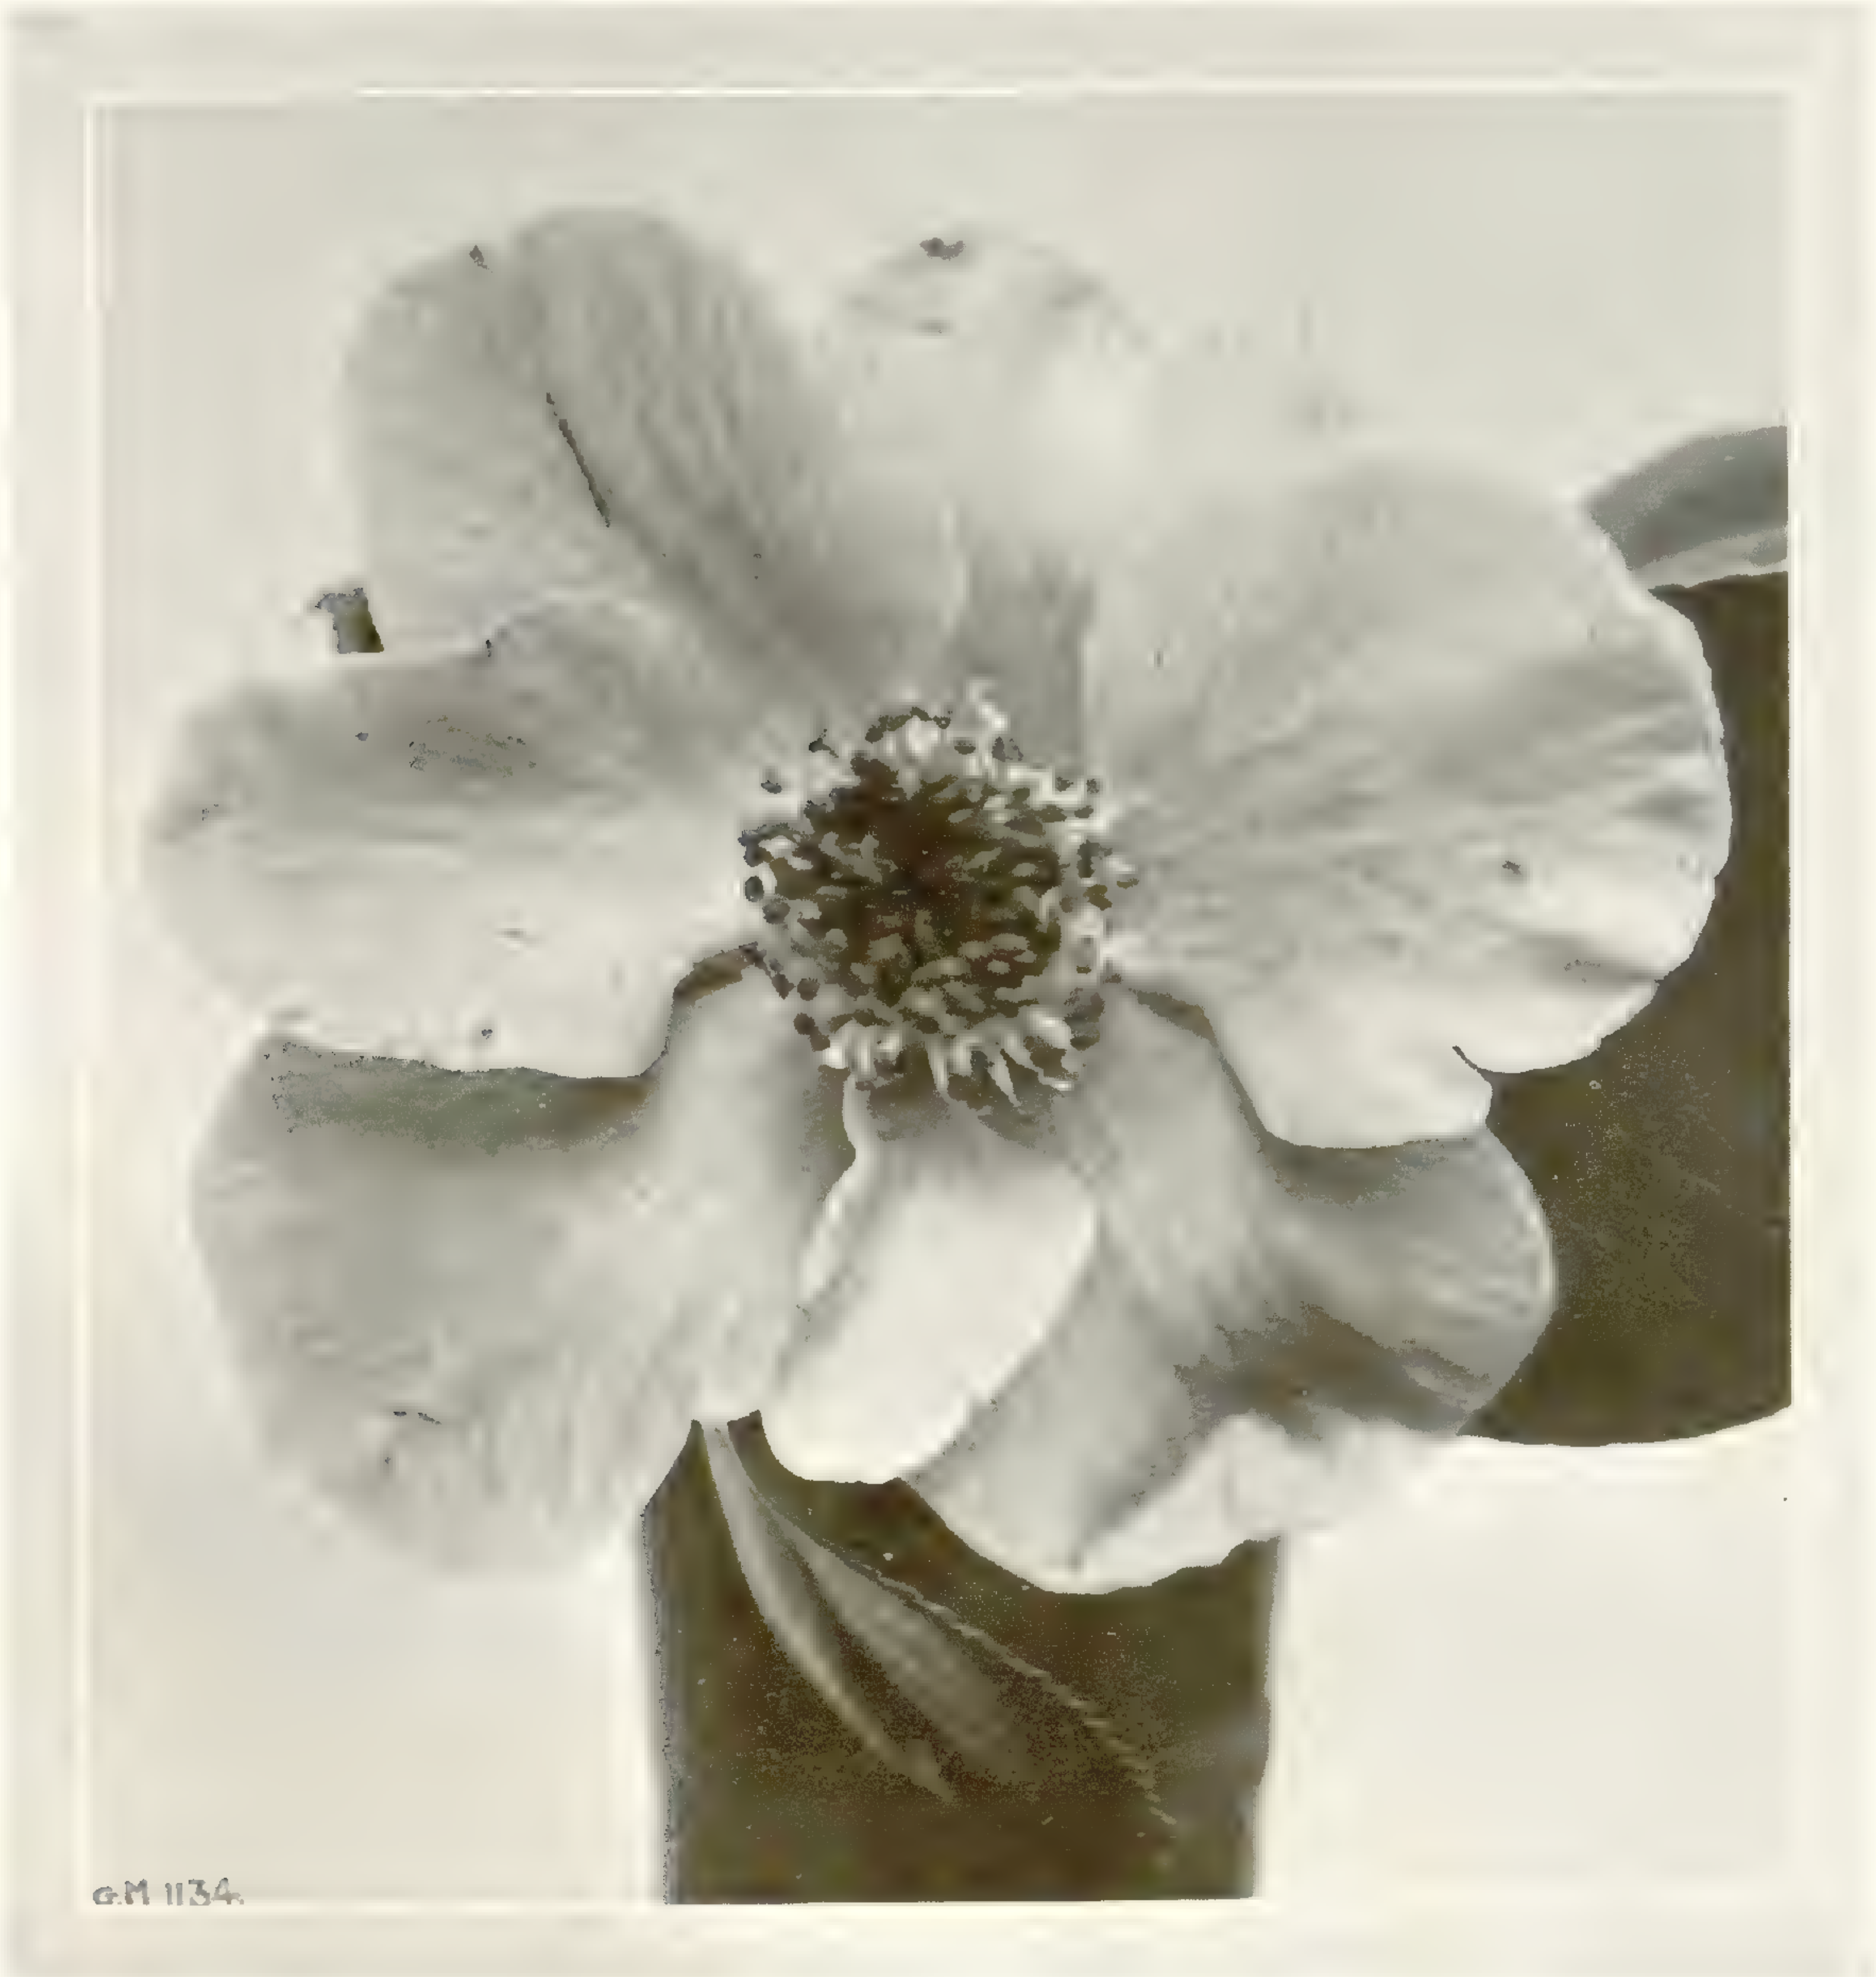
Mary Tolman, winner of the first prize at Milwaukee, is reputedly a fine acquisition, which is stated to produce more fine blooms in a season than the far-famed Enchantress. In addition it is regarded as non-fading in the strongest light, clean, upright, and healthy in growth. Conquest, a new fancy, embodying deep rosy suffusion upon a light pink ground, is undoubtedly a fine variety. The flowers are large, and the plants are of the true Lawson habit, while the stems are as long as in Enchantress. Growers should note Sangamo, even if they miss the foregoing. It comes fresh with triumphs from Chicago, St. Louis, Milwaukee, etc., and is of a bright glistening pink colour. With a quick-growing character, long stems, perfect blossoms, and a colouring exceeding Winsor, Rose-pink Enchantress, etc., the newcomer should make a name for itself upon this side of the water.

One notes with pleasure the fact that at last we are likely to see those two sterling carnations Mrs. C. W. Ward and Alma Ward disseminated among our growers. The former is a perfect long-stemmed variety, midway in colour between Mrs. Lawson and Winsor. It is very early, and free, and its winnings include silver medal at Boston, 1906, the Craig Cup at Philadelphia, 1906, the Lawson bronze medal in 1908, and the New York prizes in 1909 for the best one hundred blooms and the best new variety. Alma Ward, which I have noted on a previous occasion, is probably the largest perpetual carnation in cultivation, and is as sweetly fragrant as any. The massive blossoms are pure white, save when atmospheric changes bring out the rosy-pink markings. Its recognition to fame is shown by its receiving the Lawson silver medal in 1907, the Lawson gold medal in 1908, and the silver medal of the American Florists' Society in the same year.

Other new carnations are The Constant, a long-stemmed, large-flowered carnation, a little paler in hue than Rose-pink Enchantress; Miami Queen, which embodies good form, a good cerise colouring, and a strong constitution. So far it has proved a free, continuous variety, very good throughout the season, with strong stems and large blossoms. Shasta, the fine white carnation which has been shown several times before the American Carnation Society, has invariably been well received, and its fair size, good form, and freedom seem to betoken a good future for it; certainly it should prove useful for the market, while Washington, the new Lawson-coloured sport of Enchantress, is very well spoken of.

Other varieties are referred to in the States, but time will brand them according to their merits, but the best of the denoted varieties should be given a fair trial in our English establishments in the near future.

P. S. Hayward.



SINGLE CAMELLIA MINERVA.

Bright salmon red; raised and exhibited by Messrs. Wm. Paul and Son, Waltham Cross.

OUR ILLUSTRATIONS.

In addition to the illustrations that accompany special articles in the present issue, we give two reproductions from photographs taken at the meeting of the Royal Horticultural Society, held on Tuesday, February 8. One of these represents a fine orange tree, in a tub, exhibited by Messrs. T. Rivers and Son, Sawbridgeworth. It is the Egg orange, a variety that gives roundly-oval fruits of beautiful colour and most delicious flavour. The tree bore a fine crop, and suggests that those who grow orange trees for pleasure might with advantage obtain really fine edible varieties, give them a little extra care, and so produce fruits useful as well as beautiful. We may also point out that orange culture under glass is steadily extending, and will extend, as the exquisite flavour of the fruits so grown becomes better known and appreciated.

The second illustration shows one of Messrs. William Paul and Son's beautiful new single camellias, named Minerva. For a long number of years the Waltham Cross firm has maintained a good stock of all the varieties of camellias, and from time to time has staged goodly groups of flowering plants at the leading exhibitions. Camellias fell into disfavour as cut flowers with the advent of the longer stemmed blooms produced by forcing and retarding bulbs and shrubs, but as flowering shrubs for the cool conservatory they still fill a very important position. The double varieties have many merits, and many admirers, but the fine single and semi-double varieties now to be obtained are as free flowering, and, in some respects, more elegant, than the formal old double camellias. Minerva is bright salmon-red in colour, and has golden anthers.

Collinsia bicolor.—A patch of this pretty little annual is very pleasing when well grown, both the shape of the flowers and the combination of lilac and white being very attractive. There is also a white variety, C. b. candidissima, both growing about a foot and a-half in height. Unfortunately, like many of our annuals, it is of short duration, and should either be grown on a nursery bed in the reserve or kitchen garden, where it may be removed in time for the beds to be used for some other purpose, or, if used in the hardy flower border, it should be with a plan beforehand for filling up the space when the plants are cleared off at the end of June or middle of July. Like most annuals, it likes a deep, well-cultivated soil, not too dry and yet in full sunshine. The best way to grow it is to sow in August where it is flower, and let it stand the winter, when comes into flower in May, and produces better effect than spring-sown plants, and lasts longer in flower, besides which it can cleared off in pretty good time for succeeding occupants. But it will not always stand the winter in the open, especially in cold and damp situations, and in such circumstances it should be sown early in March or as as the conditions of weather permit. The seed should always be sown thinly, and the seedlings not be allowed to suffer from overcrowding. If it is grown in weedy fashion, so that it falls down in the first heavy rain, it is not worth the space it occupies.—Alger Petts.

SPECIAL REDUCTIONS IN PRICE OF RHODODENDRONS, etc.

We hold the largest Stock of **RHODODENDRONS** in Great Britain, all extra fine, bushy stuff, grown 1,000ft. above sea-level; being recently transplanted are in a splendid condition for removal. Special reduction will be made to clear land of the following:—

RHODODENDRONS, which can be supplied by the hundreds of thousands, in sizes from 1ft., 1½-2ft., 2-2½ft., 2½-3ft., and 3 to 4ft., by the doz., 100, or 1,000 to suit purchasers. **PONTICUMS, HYBRID SEEDLINGS, BLANDUM, CAUCASIAN PICTUM, CUNNS** (white and blush), **JACKSONII,** choice named varieties; extra fine, clean stuff.

AZALEA PONTICUM, 1 to 4 ft., extra fine.

CUPRESSUS, in all varieties, from 2 to 6 ft.

HOLLY COM., from 1, 2, 5, 6, 7, 8, and 9 ft. high; extra fine. **HOLLY HODGENSI, MADERIENSIS,** and **SHEPHERDI,** in all sizes.

LAURELS in variety, from 2, 3, 4, 5, 6 ft. high.
YEWS, ENG., from 1, 2, 3, 4, 6, 7, ard 8 ft. high; extra fine stuff.

ORNAMENTAL TREES, FOREST TREES, PLANTS FOR HEDGES, GAME COVERTS, ETC., in large quantities.

We extend a Courteous Invitation to Inspect our Nurseries, 300 acres in extent.

EVAPORATING PANS.

No doubt most people of an observant nature have noticed how very fast vegetation advances in the late spring and early summer time, when the atmosphere is moist and warm, after gentle refreshing rain. To obtain this desirable condition of the air in forcing houses, orchid houses, etc., various devices are resorted to, such as syringing, and damping down interior surfaces, but great aids are the evaporating pans or troughs fitted on the hot-water pipes.

Before hot-water pipes were so popular as now, and the houses were heated with brick flues, it was a common practice to cover the flue with shallow lead troughs, which were filled with water, or, in some cases, the top covering tiles of the flue itself were made concave, so as to hold about an inch or an inch and a-half of water; when these were all filled, and in action, and the flue gently syringed, there was perhaps a more genial atmosphere than we can ever obtain with hot-water pipes, and troughs on them. It is a fact that all artificial heat, whether from a brick flue or hot-water pipes, is arid unless it is modified in some way with moisture.

After considering the question of evaporating troughs for many years, and having several kinds in use, I think the very best are those that are cast with the pipe, that is, the pipe has a pan or trough cast with it: these are made in various widths up to twelve inches wide on four-inch pipes, but we have found that any size larger than six inches wide is liable to suddenly break when in use owing probably to the unequal expansion and contraction in so large a mass of metal. We have some that have been in use over thirty years, and are still good. The next best plan is portable zinc troughs made to fit the pipes; it is very important these should fit tightly on the pipes, as if too large they only rest in one place along the centre, and if too small only the extreme bottom points of the semicircle touch the pipe, and, consequently, very little evaporation takes place.

Cast-iron pans are now commonly used, and these, if they fit well, give good results. One of my friends very interested in orchid culture paid great attention to the evaporating trough systems, and he was not quite satisfied with any of the plans I have mentioned, so he experimented with a shallow brick tank lined with cement, and placed in it several rows of four-inch hot-water pipes, but he did not think there was much improvement on the pan or trough system. In some of our orchid houses, under the stages, where the hot-water pipes are laid side by side instead of over each other, we have adopted galvanised sheet iron tanks of varying sizes, and about four inches deep. With plenty of pipes underneath these cause a good supply of moisture to rise, and so maintains a humid atmosphere.

We have also found that a little piece of cloth laid in the end of the pan and carried over on to the pipe gradually conducts a portion of the water out on to the warm pipe, and thereby causes extra humidity, but this is only practicable when pipes are over each other, so that the water that runs off one can be caught on another. A little attention to the size of the piece of cloth will soon show the exact amount of water required when the pipes are fairly warm. W. M.

Cheshire.

THE AUSTRIAN PINE.

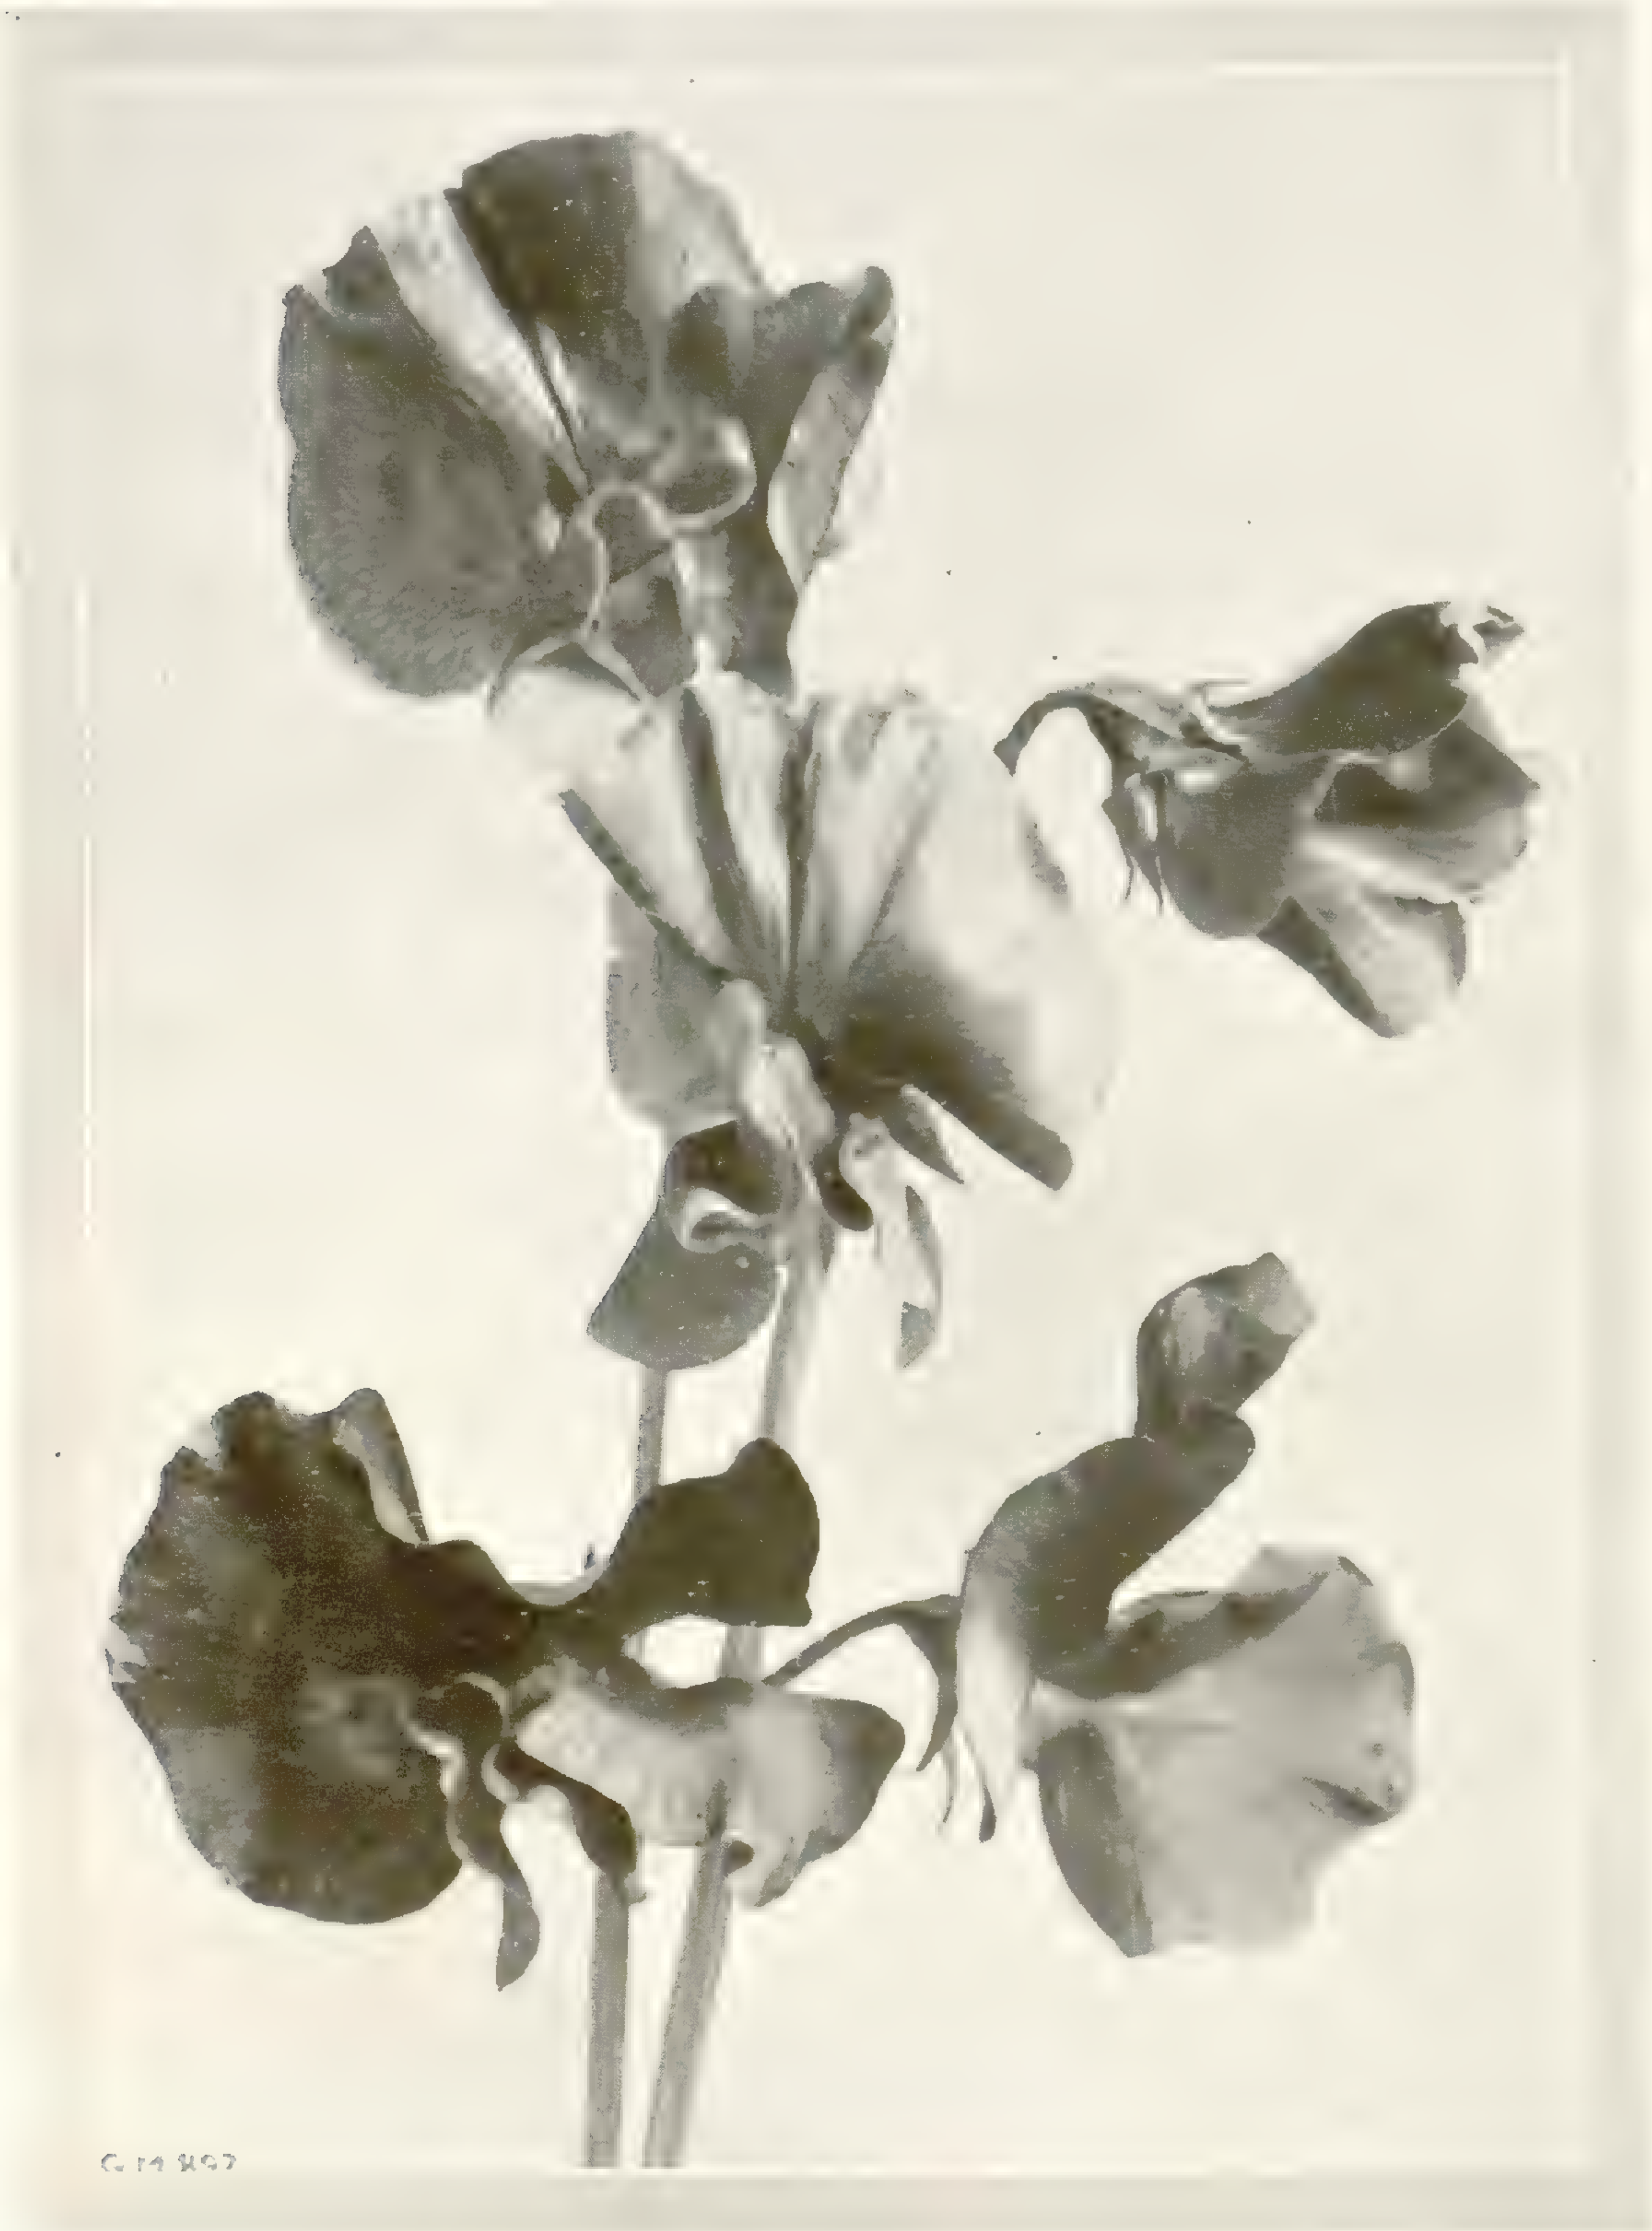
The Austrian Pine, Pinus laricio var. nigricans, is one of the best-known trees for forming a shelter, break, or a screen in exposed situations, for it thrives well in a variety of soils, and in very poor ground grows quite as well as the Scots pine. It possesses an advantage over the Scots pine from the fact of its being of much denser habit, and, in this respect, it is also ahead of the Corsican pine, P. laricio. Its timber, however, is less valuable than that of several other conifers, consequently it is planted to form a wind break for more profitable trees. In exposed situations on the East Coast it and other pines have been planted largely in some places, and usually the Austrian pine has made the best use of its time about the outskirts of plantations; from this its value as a nurse is apparent. Where a screen is required to block out some unsightly object a double row of this pine is usually sufficient, and when not crowded, the lower branches are usually retained until the trees have attained large proportions. The sombre colour of the needles are objected to by some people, and a wood composed entirely of the variety has a decidedly black appearance: this, however, can be overcome by planting a mixture of this pine and a lighter foliaged one, or larch.

A mistake which is frequently made with regard to both this and other pines is in planting too large specimens. Nursery-grown trees four to five feet high certainly look very nice, and give one the impression that they will quickly form large specimens from the appearance of the last season's growth. As a rule, however, the root system is not in proportion to the branches, and a large percentage of the trees either die outright or have a decidedly bad time. Trees one and a-half to two feet high are plenty large enough for permanent plantings, and usually such trees start away quickly, and overtake larger ones which have been planted at the same time. It is not advisable to transplant Austrian pines in the dead of winter, in fact, if the work can be delayed until April it is much the better, for every condition at that period is conducive to growth and the formation of new roots. W. D.

A FINE SPECIMEN OF THE EGG ORANGE
Exhibited by Messrs. T. Rivers and Son, Sawbridgeworth. (See page 144.)

GROUPING ROSES.

Before one begins the work of grouping roses due consideration must be given to the space available, and whether it is intended to have as many plants as possible upon it, or simply a few groups for distant effect with more or less wide spaces of lawn between. Another most important point is to be sure of the habit of growth each variety affects under normal conditions. This is necessary both in large and small groups, and more than ever so when a group of mixed varieties is contemplated.



NEW MAROON SWEET PEA, MAY GERHOLD.
Raised by Mr. H. A. Gerhold, of Penarth.

A considerable amount of care and judgment is needed to secure any lasting success with a mixed group. The height and time of flowering must be also borne in mind.

Not many of us have the advantage of almost unlimited space, and in this case it is more necessary for care in grouping. Where we may have a bed of one variety the matter is comparatively simple, and it only remains to select the desired growth and colour. I feel sure we often use too many varieties in our gardens, and better effects might be obtained by more plants of one variety. However carefully we may select, it is difficult to plant a mixed bed so as to provide a grand effect at any one time; but, confined to a single variety, the plants are generally in a uniform condition of growth and bloom. Besides, we do not want so many different roses, unless the object is a representative collection. There is ample choice of those that will continued to flower all the season—except for a very short interval while making growth for a succeeding display. And we can have almost any colour without losing these advantages. What can be more persistent in flowering, or more showy in their colours, than a bed of Lady Battersea, Lady Roberts, Killarney, Madame Ravary, Marquis of Salisbury, and Madame Pol. Varin-Bernier, to name only half a dozen? Dozens more might be added of almost any desired colour.

Small groups of the dwarf polyanthas and such Chinas as Eugène Resel, Laurette Messimy, and Comtesse du Cayla, would be difficult to improve upon. Here, again, we can have great choice of colour. Where space is available strong growers like Gruss an Teplitz, Caroline Testout, Frau Karl Druschki, Captain Hayward, Ben Cant, Climbing Mrs. W. J. Grant, and Madame Alfred Carriere, can be used to advantage in the distance, with the extra-strong Blush Rambler, Hiawatha, and similar varieties on the outskirts. By taking advantage of undulations a better artistic effect, to my fancy, is often gained with a smaller number of roses than many would use.

Where a group of more than one variety is wanted I would confine myself to as small a number as possible. For example, if Caroline Testout or Viscountess Folkestone were in the centre I would edge the bed with the dwarfest of the polyanthas, several of which are so similar in growth that three or four varieties might be planted alternately. A group of three or four plants of almost any Wichuraiana rose is very showy, but never more so than when kept to one variety in the clump, more especially if care be taken to plant these alternately with early and later bloomers, thus avoiding the blanks and empty patches so often seen. The difference in time of blooming among these is very, very great, and I will endeavour to give a few in order of blooming. The flowering time of rambling roses, so far as I have noticed, is about the following dates. Even if a season is later or earlier the approximate time is the same.

Second week in June: Electra, Flora, Amadis, Carmine Pillar, Polyantha simplex, Aglaia, Euphrosyne, Leuchtstern, Tea Rambler, Thalia, Perpetual Thalia (and throughout the season), Waltham Bride, Alberic Barbier, and Ruby Queen.

Third and fourth week in June: Gardenia, Elisa Robichon, Pink Roamer, Noisettiana, Lady Curzon, Una, Psyche, Polyantha grandiflora, Moschata alba, Blush Rambler, Rene Andre, Madame Plantier, Trier (continuous), Marco, Joseph Billiard, Francois Foucard, Jersey Beauty, Alexandre Trimouillet, Claire Jacquier, Ruga, Gracilis, and Conrad F. Meyer.

Early in July: Ne Plus Ultra, Queen Alexandra, Stella, Mrs. W. Flight, Mrs. O. G. Orpen, Aimée Vibert (and late), Ard's Rover, R. Brunnois, Debutante, Philadelphia Rambler, The Wallflower, Bennett's Seedling, Madame Viviand Morel, Rosa Plena, Félicité Perpetué, Rivers' Musk, and The Garland.

Mid July: Princesse de Nassau, Dundee Rambler, Crimson Rambler, Adelaide Moulle, Delight (and until frost comes), Dorothy Perkins, Lady Gay, Hiawatha, Edmond Proust, the Wichuraiana type, and Rubra, Farquhar, and Evangeline.

A. Piper.

SWEET PEA MAY GERHOLD.

This fine sweet pea may be well described as a waved or Spencer form of the old favourite Black Knight, possessing all the lustre of the latter deep maroon variety, with the addition of extra size and waviness. It was raised by Mr. H. A. Gerhold, of Windsor Road, Penarth, a chemist, who has for many years made a hobby of sweet pea culture, and has raised numerous varieties. Others have raised a variety that is very closely akin to May Gerhold, and it is probable that Black Knight Spencer, from America, is identical, but time will prove this. The National Sweet Pea Society's Floral Committee consider that Anna Lumley, Black Knight Spencer, Douglas Unwin, Maroon Paradise, May Gerhold, Nubian, and Othello are so very much alike, indeed too much alike to be shown together, or any two of them together, in the same stand at an exhibition of the society. All this shows how keen the raisers are, and it also shows the need of such an authority as the N.S.P.S. to prove the alikeness of varieties.

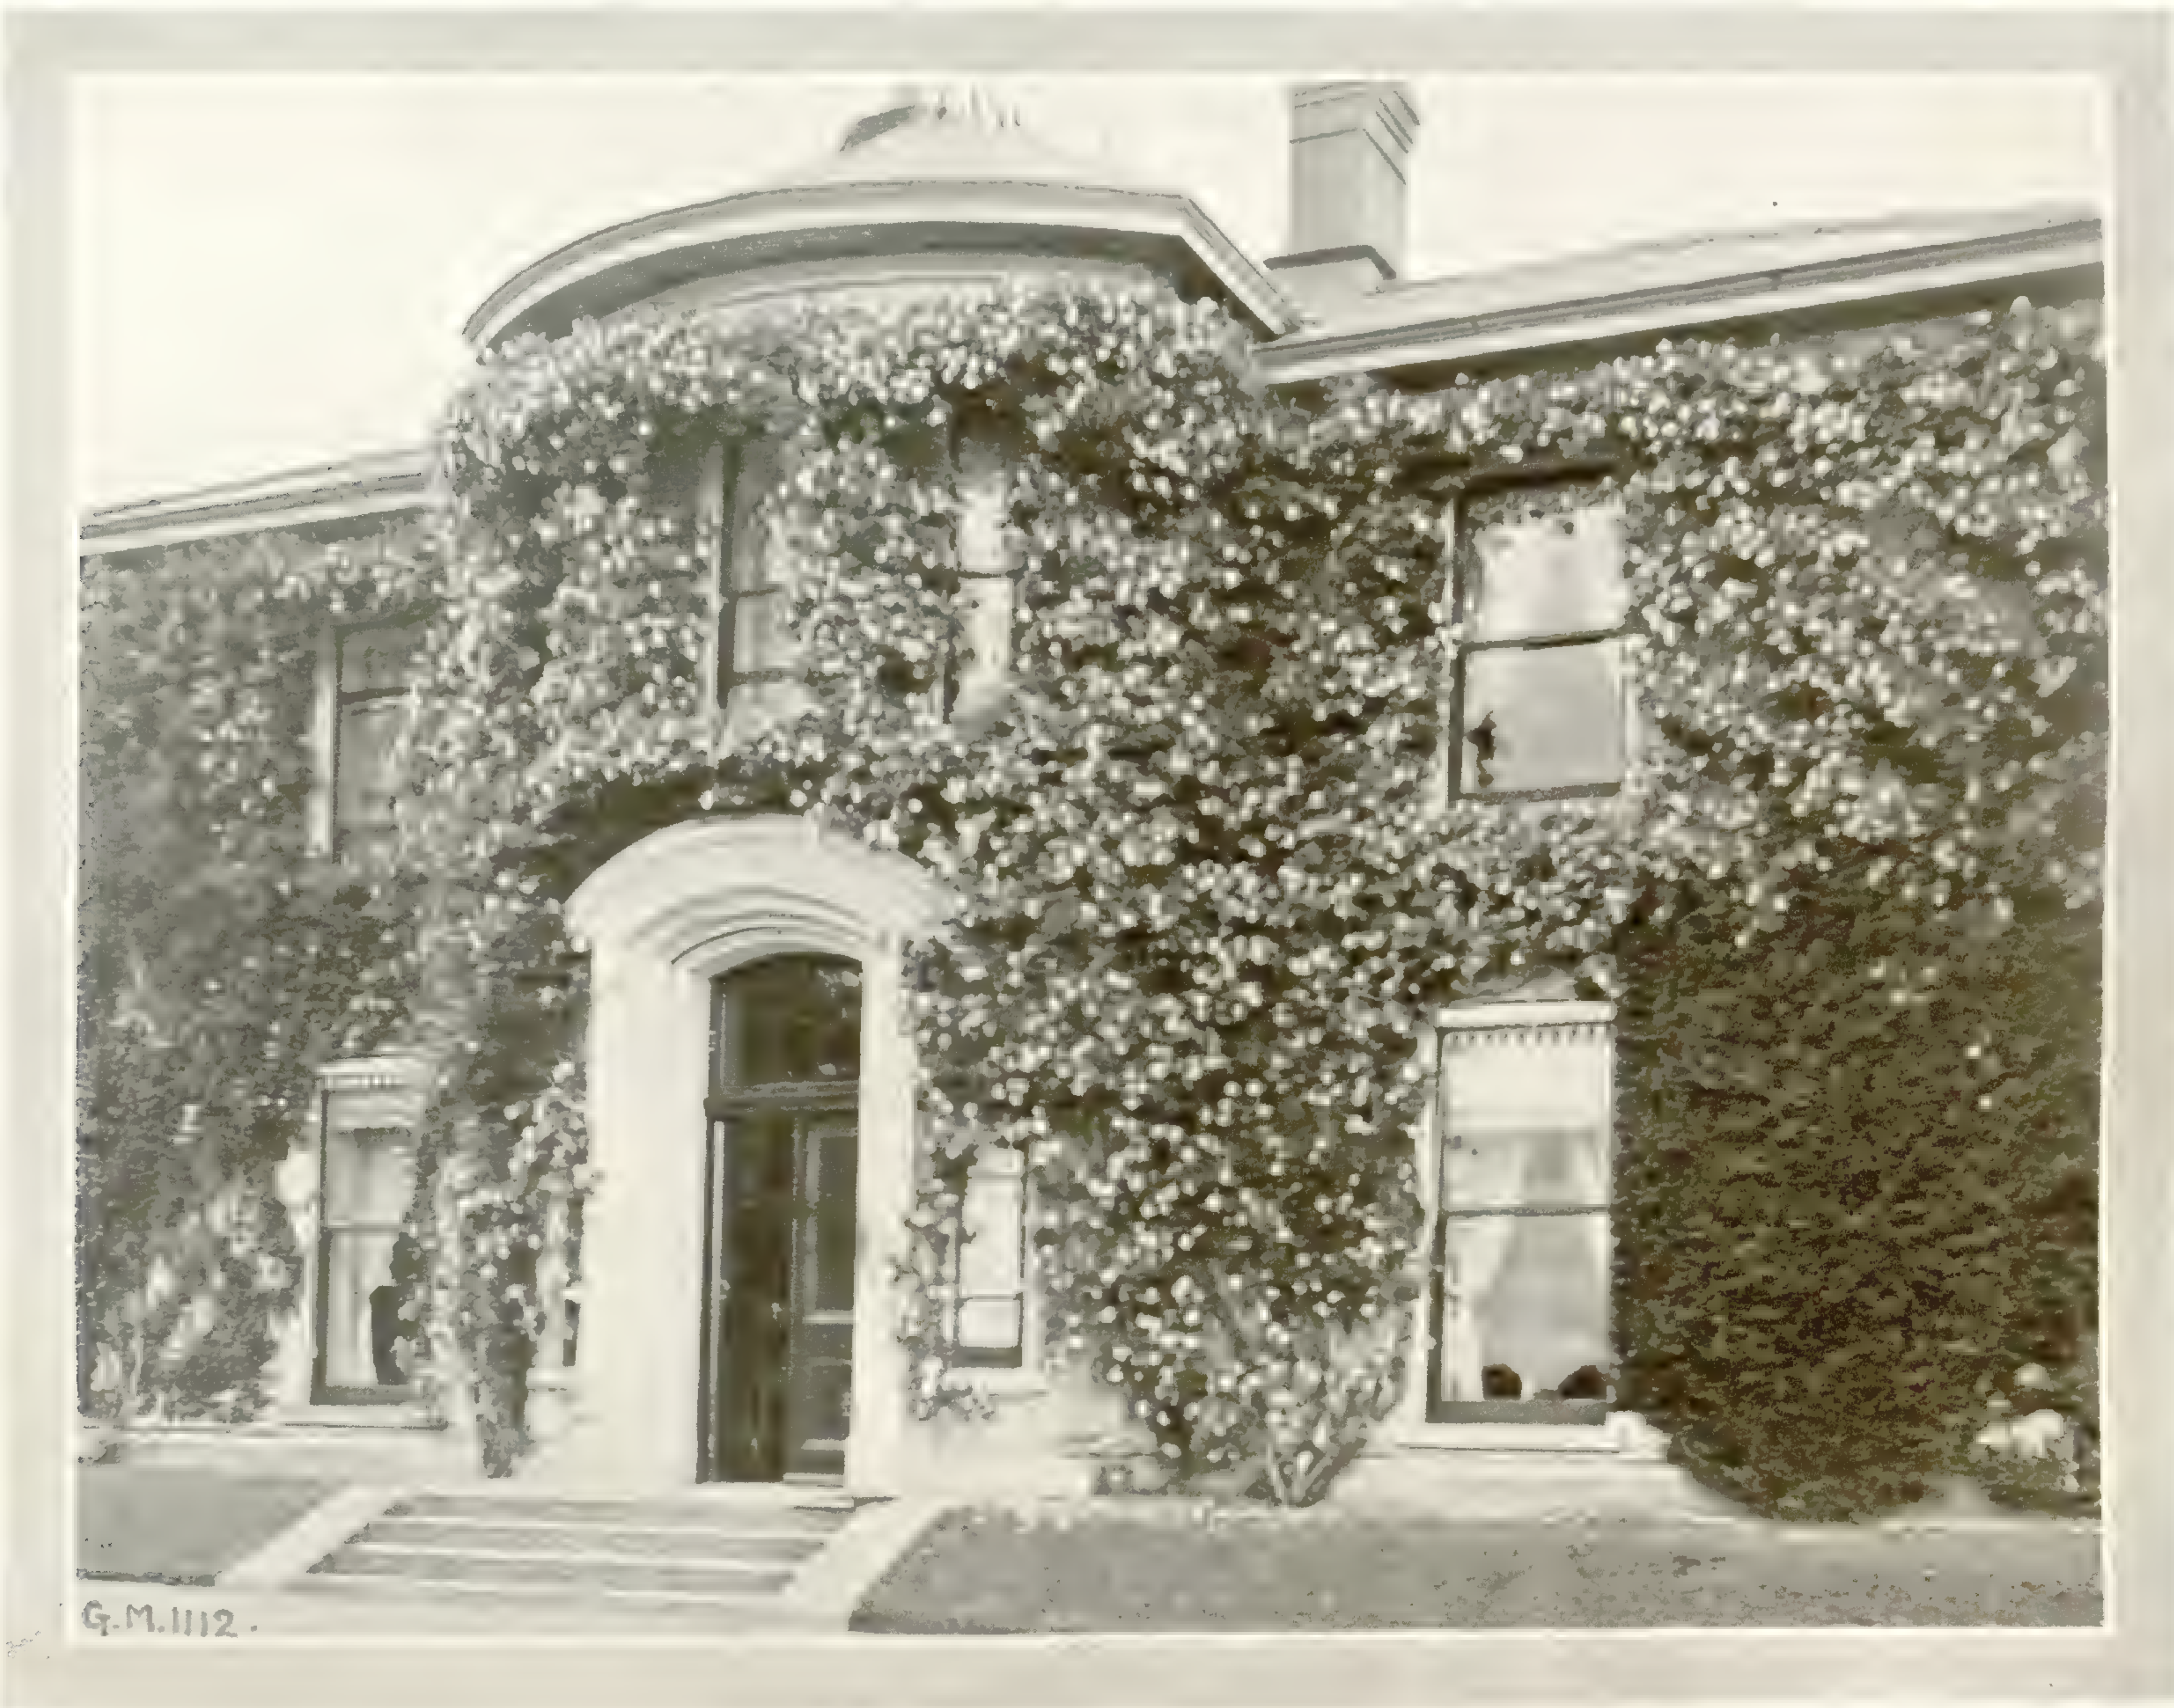
WILLIAMS' EVERGREEN ROSE.

While it is desirable the rose grower should take sufficient interest in new roses to be in a position to add to his collection such novelties as appear to be well suited to his requirements, it is of some importance that the old varieties possessing merit should not be allowed to pass out of mind until they have been superseded by others of a similar character. It would certainly have been well for gardens had the finest of the rambling roses that were introduced about the middle of the last century been kept constantly in view, for had this been done they would have been more freely utilised in clothing the walls of dwelling houses and divisional screens, arches, and other suitable supports than has been the case. Probably no class of roses has been so greatly neglected as the ramblers belonging to the period mentioned, for until the brilliantly coloured Crimson Rambler brought the ramblers into prominence, it was a rare occurrence to meet with a good specimen of any one of them. A few must have been planted annually, or, it may be assumed, they would have disappeared from trade collections. Williams' Evergreen has suffered as much as any of the older rambling roses from a want of appreciation on the part of rosarians, and as well-developed specimens are decidedly rare, the one of which an illustration is given herewith is of special interest.

This beautiful old rose was introduced in 1850, or it may be a few years later, it not being possible to exactly determine the year of distribution. One thing is certain, and that is the appearance of the variety did not create much interest, for a close and somewhat lengthy search failed to find a mention of it in the periodic literature published during the fifties. This is a point of some interest as showing that the failure to appreciate the charms of the older ramblers was not less marked in bygone days than at the present time, when growers have at their command so many beautiful varieties of quite recent introduction. As so clearly indicated in the illustration, Williams' Evergreen is vigorous in growth and free in blooming, and, therefore, admirably adapted for covering large wall spaces, its value for the purpose being enhanced by the persistency of its rich green leafage. It will also be seen that it is very attractive during its season of flowering, and it may be mentioned that the flowers are white, suffused with rose, and are produced in clusters.

In illustrating the remarkably fine specimen that clothes the walls of Dunshane, Co. Kildare, the residence of E. F. Moore, Esq., we have no wish to unduly exalt the merits of the variety, or to divert attention from the many beautiful ramblers of recent introduction that are now at the command of cultivators. Our object is simply to give our readers an opportunity of seeing one of the finest specimens of the variety in the United Kingdom, and to direct attention to its value for beautifying large wall spaces.

Roses may be grown to perfection by following the instructions given in ROSES AND THEIR CULTIVATION, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.



A FINELY-FLOWERED SPECIMEN OF WILLIAMS' EVERGREEN ROSE
At Dunshane, co. Kildare.

DESSERT APPLES FROM DECEMBER TO JUNE.

Fortunately the list of apples suitable for late supplies steadily increases, and this enables growers to make a wider selection of varieties for their particular locality. Readers will readily understand that the varieties I refer to do not all possess the high flavour of Cox's Orange Pippin, but, all things considered—ease of culture, cropping, and quality—the following are a very useful set.

December and January.

At this season the best fruits I have grown are Adams' Pearmain, a handsome conical fruit, with excellent flavour, and a variety that does remarkably well as a bush, cordon, or pyramid. It is, I think, still one of the best, as it gives but a small percentage of poor fruits, and keeps well into March if necessary. Readers may say, "Why, we can have Cox's Orange Pippin good at this season, with cool storage," and certainly we can, but it is none too plentiful after Christmas, and here I would remark that, with all late dessert apples, very much depends upon storage, and how the fruits were gathered. These are important points, and gathering, in most cases, should be deferred as late as possible for keeping purposes. The late Mr. Anthony Waterer used to show me splendid Cox's Orange Pippins in May, but I have never succeeded in keeping good fruits in the South after December.

A very delicious apple at this season is King of Tompkins County, but this is not a success everywhere. In the North it was fine as a cordon, on well-drained soil, but even on soils where the crop is not heavy its splendid quality makes up for any other deficiency. Barnack Beauty is a splendid fruit, as it rarely fails, makes a neat growth, is a heavy cropper, and very handsome. This is one of the newer introductions, and worth room in all gardens. It is not so sweet as some varieties, but has a brisk flavour that many like. Winter Ribston is another lesser known midwinter dessert apple well worth a place. A Continental variety, flat, russety, of the Blenheim habit, and of excellent quality when root pruned and grown on the paradise stock; this apple should not be gathered early, as it shrivels badly.

Christmas Pearmain, one of the newer fruits, was a great favourite grown as a cordon. It is a great cropper in a young state grown on the paradise stock, and is a handsome fruit for the dessert. Cornish Aromatic, a variety less grown in the Midlands than it deserves, is, as its name implies, of good flavour; indeed, it is also a handsome fruit when well grown, and a free bearer. In the West it makes a fine standard, and fruits much better than the larger Cornish Gillyflower; it also makes a good bush or pyramid.

February to March.

Claygate Pearmain is one of the very best of apples at the season named, and though the tree is not a vigorous grower, it is hardy, and does well in most soils and situations; it makes a good bush or pyramid, and fruits freely as a cordon or espalier, but its charm is in its superb quality. It is not a showy fruit, but of medium size, much russeted in some soils, and it has a good deal of the Ribston flavour. Duke of Devonshire is a variety that, given cool storage, will keep well into April, though it is certainly at its best from January to March; this is not a large fruit, but of fine flavour, and a good bearer, and, like the Blenheim, it should be left as long as possible on the trees before storing. Lord Burleigh is not a large fruit, but round, and not unlike a Nonpareil. Yet it is one of the best dessert apples we have as regards quality, being sweet, with a pine flavour. It is a good cropper on the paradise as a bush or pyramid, and is at its best at this period of the year.

Sanspareil is quite distinct from any of those noted above, and, given cool storage, it may be kept well into the spring; but it is a most useful fruit in March, very handsome, a great cropper, and keeps as sound and crisp as a Cox's Orange in October. Having good flavour, it is a valuable addition to the best keepers at this season. Lord Hindlip is a good bearer, not strong, but of good flavour. Mrs. Phillimore is one of the newer fruits, of excellent quality, very sweet, and a compact grower; this does well as a cordon or bush, and is a very fine bearer.

April, May, and June.

D'Arcy Spice is an old Essex apple of excellent quality, and a fruit that varies greatly in certain soils. In some places it is much russeted, in others of a deep bronzy colour, not always a heavy cropper, but of excellent quality, and in season from April to May. It is also known as the Spring Ribston. Another of the russets, Brownlee's, is an excellent spring variety, and of fine flavour, doing well as a bush or standard. It is a moderate bearer, and much superior to the Boston Russet as regards crop and quality. Allen's Everlasting is one of the latest apples on this list, and there is no difficulty in keeping it till May; it is of good flavour, and a compact grower. Fruits should be left on the trees as late as possible. Though a small fruit, it is of great value for its lateness, and it does well in most parts of the country. I have in the North kept this variety until June.

From my list it is difficult to omit Sturmer Pippin on account of its late keeping. This old variety keeps well into June; it is not large, and should be left as late as possible on the tree. Prolific on the paradise, it is worth a wall in a cold district, but in the South I have seen good crops from standards. There are a few other varieties worth adding, but the above, from my own experience, are the best.

Brentford. G. Wythes.

PLUMOSE FERNS.

Although the great majority of fern species present in their fronds some resemblance to a feather, owing to the midrib bearing on each side divisions of more or less delicate cutting, arranged on feather-like lines, it is in the abnormal "sports" to which the term "plumose" has been applied that this character is most exemplified. It appears to be correlated with what is termed free venation, that is, the possession of a vein system in which the veins, or most of them, terminate at the edges of the segments, as distinct from a reticulated or netted system, in which they are connected together in such a way as to form completely enclosed areas of the fern tissue, frequently forming pretty patterns. A little study of the character of plumation clearly discloses the reason.

In ferns whose veins are free, terminating normally at a smooth even edge, such as we see in the blechnum or Polypodium vulgare, variation often takes the simple form of serration, or the formation of saw-like teeth, owing simply to extra lengthening of the veins, which then carry the frond tissue with them. This extension may be carried so far as to transform a once divided or pinnate fern into a bipinnate, tri-pinnate, or even quadri-pinnate one, the lengthened veins becoming midribs, and repeating on a smaller and smaller scale the specific form of sub-division. The most remarkable examples of this are seen in the marvellously decomposite or plumose forms of the normally pinnate or once-divided Nephrolepis exaltata, which have appeared within the last few years. It is clear that a netted venation would stand in the way of continuous sub-division on these lines.

In scolopendriums the veins, a short distance from the midrib, fork into pairs, and normally each pair is continued to the smooth edge of the frond without further division, thus contributing to form a flat strap-like lamina. In the plumose type of this species, known as "crispum," the vein pairs fork again and again as they approach the edge, with the result that the edge, while still remaining smooth, will, if measured, be found to be twice or thrice as long as the midrib, and hence a more or less deeply folded frill is formed. In the true "crispums" this extra development of tissue is accompanied by an entire absence of spores, but forms of crispum have been found which bear spores somewhat sparsely, always, however, at the expense of the frill, which becomes defective, because those vein pairs which bear spores either do not fork again, or, if they do, they extend for a shorter distance, and thus lead to an irregular edge instead of a smooth one. The free venation of the Hartstongue permits it to vary also on the lines previously described, viz., by extension of the edge into projections, which in some varieties even go as far as to closely approach the pinnate type of other species. Here, however, it would appear that a bipinnate form is an improbability, the simply forked vein system precluding repeated lateral segmentation. This fern, however, is so protean in character, having undoubtedly sported into more varieties than any other species in existence, that it would be rash to say anything is impossible. The true "crispums" are, as we have said, perfectly barren, and this absolute sterility is correlated with all fern sports that should properly be termed plumose, and are very few in number.

In our native ferns we have the several forms of Polypodium vulgare var. cambricum, Asplenium trichomanes incisum, Scolopendrium vulgare, crispum, and Lastrea montana plumosa, all of which have been repeatedly found as wild sports in widely different localities, and have never, so far as we know, been found to bear spores, though it is clear that they must have originated from fertile progenitors. The exotics are also few in number, those we can recall being Adiantum Farleyense, Phlebodium Mayi, Polypodium Knightæ, and Nephrolepis rufescens tripinnatifida. In addition, however, to these barren plumosums, which may be termed the true ones, there is a great number of ferns so named, and justifiably so as regards their beautiful dissection, but which are all more or less fertile, while most of them are secondary sports due to selection. The exceptions, i.e., the wild finds, are Polystichum angulare plumosum Pateri, Wollastoni, Molyi, Athyrium filix fœmina plumosum Axminster, divaricatum, and Willsi, Lastrea filix mas Bollandæ, Adiantum capillus veneris cornubiense, a counterpart of A. Farleyense, and Asplenium marinum plumosum. The plumose forms obtained by selective culture as secondary sports, though the spores of wild finds, have, however, attained a degree of feathery development far transcending any wild variety yet found.

In the polystichums there is what is known as the Jones and Fox plumosums, raised by Colonel Jones and Dr. Fox, from a merely decomposite find of P. angulare. This section, which embraces several variants, has fronds so repeatedly and so delicately divided, and their segments so densely overlapping, that even that marvellous fern Todea superba is surpassed, and it is only the new developments of Nephrolepis exaltata above alluded to that can rival them. More recently the near relative of P. angulare, viz., P. aculeatum, has yielded, through P. a. pulcherrimum, a wonderful strain of plumose forms characterised by extreme tenuity of the divisions, and their great length, a normal half-inch pinnule being lengthened to nearly three inches in some cases (P. a. gracillimum Druery). The latest development of this section, P. a. pulch. plumosum (Green), rivals the Jones and Fox angulares in its fine dissection and density.

Finally must be mentioned the writer's "superbum" section of Lady Ferns, derived from the wild find A. ff. plumosum Axminster, through one of its somewhat improved offspring, A. ff. plumosum elegans Parsoni. This case is unique, since a non-crested fern produced over 90 per cent. of finely crested offspring, the best of which, A. ff. superbum Druery, yielded a batch of crested and uncrested forms, some of the crested being tasselled to the fourth degree, i.e., with crested pinnulets, while the finest uncrested one A. ff. plumosum Druery, has no rival at all in size and dissection, and many of its sister plants well justify the name of "superbum" applied to this section generally.

Chas. T. Druery, V.M.H., F.L.S.

THE READING PRIMULAS.

When a gardener, amateur or professional, is making arrangements for a forthcoming season there are a few things to which he gives very special attention, because so much depends upon their success or failure. When the new seed catalogues arrive, and after the vegetables have been duly considered, and the quantities of seeds necessary have been marked on the order sheet, the floral section comes up for discussion, and in this division there will be two classes of plants turned to first of all. For flowering out of doors the sweet peas will have first call, but for flowering under glass primulas will come first on the list.

A CONSERVATORY GROUP OF THE DUCHESS PRIMULA.

The Chinese primulas occupy a very important place in the yearly round of horticultural activities, chiefly because they bloom at a season when other flowering plants are comparatively rare. In these days we have many more kinds of flowers available during late winter than was formerly the case, but we must remember also that the demand for flowers and plants to brighten our homes and glasshouses, our hotels and restaurants, and our various social functions, has also greatly increased. We want diversity of form and colour, and, therefore, instead of there being less need for Chinese primulas there is the greater need for them. A batch of well-grown primulas, single or double, white or coloured, plain or frilled, palm-leaved or fern-leaved, is no mean test of a gardener's skill. Every plant, with its well-developed tiered spikes of beautiful blooms, surrounded by neat green leafage, is a perfect picture, either for the room or the conservatory, and in passing it may be pointed out that primulas, especially the star varieties, are greatly valued as single specimens for the decoration of the drawing-room, the boudoir, or the dining-room.

It follows that however skilful the grower may be, his skill is very heavily discounted if it has been expended upon an inferior strain. The seeds look all alike, whether they cost sixpence or half-a-crown a packet, and they may all germinate, and grow with equal readiness and vigour; indeed, the cheaper seeds may appear to give the finer plants. But the testing time is in January and February, perhaps even earlier if early batches are brought forward. There is then a world of difference to be found in the size and solidity of the flowers, the habit of the plant, and the colouring of the blooms, and this difference is out of all proportion to the initial difference of the price paid for the seeds.

To appreciate the extreme care taken to maintain and to improve the Reading primulas one must pay a visit to Messrs. Sutton and Sons' trial grounds at this season of the year. The display is a marvellously beautiful one, house after house being filled with superbly grown plants carrying trusses of delightful flowers in many shades of colour. All are being grown for seed, all are absolutely true to colour and form, and each batch of each variety has its own pollen brush all to itself. Of several of the varieties catalogued there are numerous batches of plants, some resulting from selections made for the purpose of improving the variety in a certain direction. If the selection proves successful then in due course it supplants the variety, and growers have the benefit of this patient care and experiment.

So extensive have been the crosses made at Reading that it is difficult to conceive one that has not yet been effected, and the stud book very soon shows what the combination of any two varieties will produce. For instance, it has been proved beyond a doubt at Reading that the delightful primula named Duchess can be produced by crossing Crimson King with a dark-stemmed white-flowering primula. Systematic records, such as these, are intensely interesting, and they save time and trouble. It is not given to every visitor at Reading to see this stud book of primulas, neither is everyone admitted to the little set of small houses far away from the general range of glass, and wherein the firm tests its own seeds each year. The seed stock in the large houses are specially selected and saved, but in these smaller houses are plants from the ordinary packets as distributed to customers last spring. No special treatment is given, and only ten plants of each variety are grown on from the seedling stage, and flowered in quite small pots, and every plant is true to form and colour; ten plants only are allowed, and rogueing is impossible.

Turning to varieties, there seems still to be an idea prevailing in some quarters that the race of giant primulas, for which Messrs. Sutton and Sons are deservedly famous, is the result of special culture. It is nothing of the kind, but is the result of cross-breeding and selection over many years. The giant race have stout flower stems, fine spikes, and very large flowers of wonderful substance, as compared with the usual type, and, moreover, they are shy seeders. Six varieties of giants are offered; three are white, one of these having unusually finely fringed flowers—alba magnifica, while the others are Giant Pink, Giant Crimson, and Giant Salmon. A Giant Blue is in the making. Among the not less beautiful varieties of the ordinary type a few of the Reading specialities are The Duchess, still a superb, attractive, and distinct primula; The Czar, a fine blue; Lord Roberts, rich salmon; Pearl, one of the oldest and best of white varieties; Royal White, of wonderful form and substance; Crimson King and Brilliant King, both of splendid colour, the latter rather more fringed than the former, and Coral Pink, a delightful and delicate creamy-pink shade.

The star primulas occupy a higher position now than ever they did, their elegance and freedom more than atoning for any lack of form in the individual flowers. The original White Star has been improved upon, and now White Queen is the foremost white of its class. Then there are stars of all sorts of colours, quite a constellation; there are Pink Star, Ruby Star, Carmine Star, Pearl Star, Dark Blue Star, Light Blue Star, and Lord Roberts, the latter a deep salmon-pink colour. A slight doubling is being developed in this section, and already a double form of Ruby Star is on the market. This slight doubling adds still further to the longevity of the flowers. The double Chinese primulas must not be overlooked, because of their immense value for cutting as well as for use as plants. The Double Duchess is one of the newest developments, but there are also double pink, scarlet, blue, salmon, white, and flaked varieties, all of the greatest beauty.

The cyclamens are also very fine just now at Reading, and the large triple-spanned house filled with their elegant and often sweet-scented flowers, provides a choice picture of floral beauty. Here, too, there is a giant race, with fringed and papilio varieties, and exquisite colourings in the normal type. From purest white to deep and brilliant crimson the colour range passes through pink and salmon, mauve and purple, cherry and rich red. For brilliance of colour Vulcan is not yet surpassed, and there is nothing finer in pure white than White Butterfly. In their way cyclamens are quite as valuable as primulas, and they appeal even more strongly to some people, because the long-stemmed blooms are more generally useful for cutting than are the primulas, always excepting the star section of the latter.

WINDOW GARDENING IN SPRING.

The term window gardening includes all methods of growing flowers outside the windows, from the humble row of pots or narrow box of earth filled with plants, to the long wide balconies where pots of flowers are arranged tier upon tier. The pleasure to the possessors is probably not less in the former case than in the latter, and, however large our gardens may be, it scarcely lessens the enjoyment to be obtained indoors from flowers growing so close to us. In these days, when we have our windows more widely open than our forefathers used to have them, the opportunities for enjoying this window gardening are greatly increased, while to wake on a bright May morning and hear the bees busy at our open windows, and occasionally sailing in and out of the room, is as nearly Arcadian in its simple pleasure as most of us have the opportunity to experience.

VIEW IN THE LARGE CYCLAMEN HOUSE AT MESSRS. SUTTON AND SONS' TRIAL GROUNDS, READING.

To make window gardens a source of continued delight for six or eight months of the year, and of some amount of interest for the remainder, involves a good deal of labour, compared with the same amount of display in the open ground, and this is more especially so in the spring. After a display of hyacinths some appear to be quite satisfied if there is nothing to succeed them until the time of pelargoniums, but this is not good enough, for the growth of bulbs after flowering is rarely beautiful, and if we remove them altogether it leaves a blank to which we do not get accustomed for some time. If we grow bulbs we should be prepared with something to succeed them, as the utmost time they last is three weeks, and the planting of other spring flowers in the same boxes as the bulbs is not in general to be recommended, for not only is there insufficient room for the roots of both when dry weather comes, but the foliage of the bulbs after flowering spoils the effect of the plants which bloom afterwards, there being no room to produce the effect of bulbs in beds with surfacing plants, while seeing the arrangement at such close quarters as we do we are more exacting in our demands, or it takes more to satisfy us.

After many years of experience of window gardening I am of opinion that the only plants which give satisfaction throughout the spring, from the middle or end of March to the middle or end of May, according to the season, are wallflowers, supposing the plants to be well grown, that is, eight to twelve inches high, before flowering, and as much through, branching out right from the base. Such plants are as good as small shrubs from October to March, and for two months they are beautiful, reckoning from the opening of the first blossoms. The raising of the plants, and subsequent potting or boxing up, and even sticking, involve a good deal of work, and need some little experience if the plants are to give satisfaction afterwards, but the work is certainly repaying. In a north aspect, or anywhere between north-east and north-west, not only a sharp winter, but even a week's frosty wind in March, when the soil cannot thaw in the daytime to enable the roots to make good the loss of moisture by the parching east wind, may cause the loss of some of them, but it is the exception, though a few reserve plants should always be kept potted up in a frame.

Another good subject for our purpose is the primrose in its various forms, large vigorous plants, such as are obtained from seedlings raised early in the previous spring providing handsome foliage all through the winter, and lasting a long while in flower in the spring. Liquid manure occasionally will add to the darkness and robustness of the leaves, which are among the most beautiful of our spring plants. Where wallflowers and primroses are arranged in boxes of a good size some low-growing bulbs, like squills, chionodoxas, and grape hyacinths may be planted amongst them, as their foliage will be pretty well concealed by the free growth of the plants afterwards. Snowdrops, Anemone appenina, and other small-growing things will occur to the reader as supplementary flowers in this kind of window gardening.

Where, however, more temporary things are used for the main display the window garden will not be a success in the spring unless a second set of pot plants or duplicate boxes are kept in reserve for succession. The gap is not early in the spring, as the bulbous plants look well, or, at least, interesting, for two or three weeks before they flower, but it is during the month of May that something more is necessary. I have seen a blaze of yellow produced by small plants of Alyssum saxatile compactum, but it is unfortunate it is of such short duration—seldom much more than a fortnight in full beauty—though it just bridges the gap between the earlier spring bulbs and the summer flowers. Being a cruciferous plant it is not a very good one for transplanting, and it is best potted up in October, using either seedlings or cuttings of the same year. Daisies are not to be despised when well massed together, but better than either of the foregoing are May-flowering tulips in a setting of Myosotis sylvatica, a good display being made during the whole month. Aubrietia, too, makes a beautiful colour patch if nice shapely plants can be massed together, so as to give the appearance of growing over the sides of a bark-covered box, but it is more easily said than done. The more compact varieties of the viola are second to nothing for May window gardening if properly provided for, though, being gross feeders and lovers of moisture, a hot May sometimes makes them deteriorate very quickly, but we do not often have more than a few days of heat at that season. In any case, the violas must have a deep and wide box, and should be filled with good tufts; then, with a cool or damp May, a very good result may be expected right into June.

Most spring flowers are lovers of coolness and moisture, even the gorgeous tulip, and the secret of success with window gardening at this season is not to let them suffer from want of water, and if some liquid manure can be used occasionally it will be all the better. Pots should always be set in saucers, as there is little fear of their standing in water long at this season, when they are so full of active roots, while even boxes should, and often may have, some arrangement for preventing undue inconvenience from water dropping underneath. Tin trays to fit the boxes are not expensive, and are a great contribution to the solution of the watering problem in dry spring weather. It is not necessary to fill the trays with water, though it will do no harm during a warm dry spell, but by retaining the water that is given to the boxes they will reduce the labour of watering by half, and the risk of the plants suffering from drought to a minimum. **Alger Petts.**

EARLY CELERY.

The first batch of celery plants is generally raised in strong heat, and very rich compost. It is quite possible to overgrow these plants in such circumstances. Inexperienced cultivators should not be over anxious and simply rush the growth of the plants during their early stages, or the hearts will be pithy instead of solid. While engaged in reporting a large provincial show, a few years since, I heard two well-known judges commenting on some remarkably large sticks of celery. One gentleman remarked to the other, "Yes, they are very fine to look at, but they are overgrown." On close examination the centres were found to be pithy, and so the first prize was awarded to smaller, but firmer sticks.

When I was a youth at home I had my special garden, greenhouse, and frame. I tried hard to excel at celery culture. Having raised a stock of young plants early, I grew them in deep boxes filled with a rich loose compost, and plunged the boxes in a strong bottom heat. A gentleman, paying a visit, who saw them said, "What a grand lot of celery plants." I thought so, too, and was pleased at the remarks made, but later in the season I was much disappointed, as nearly all my plants were practically worthless on account of their defective centres. I was taught a lesson early which has never been forgotten.

I am not against the practice of giving young celery plants some bottom heat, but the latter must be very moderate, and the plants must not, at any stage, be unduly forced. Avoid all causes of checks. The hardening process must be gradual, and for a fairly long period prior to the final planting out the plants should be grown on a cool base. If the plants are so treated they will prove satisfactory throughout the whole season. **G. B.**

GREENHOUSE MANAGEMENT.—The Amateur's Greenhouse, the popular book by the Editor of "Amateur Gardening," not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d. from The Gardeners' Magazine Office, 148, Aldersgate Street, London.

SWEET WALLFLOWERS.

Single wallflowers are said to increase in popularity year after year, while the double wallflower goes as rapidly out of fashion; there are few blossoms probably that are more deserving of the culturist's skill and patience, since it is easy to decide what novel forms would achieve fame and earn gratitude. We want a miniature type, not of compact bush shape, but growing with three or four stems, with the graceful habit of the old plant that is found waving its scented sprays from many a ruined wall, and this elegant dwarf should show all the rare shades that now delight us in the larger kind, lemon, apricot flushed with rosy-red, orange, ivory, and purple. Next we need a double wallflower, not a stiff spike producer, as arrogant and unbending in appearance as the mullein or hollyhock, such as the present double, but a variety such as Fire King, Harbinger, or the ordinary Blood Red, only with each blossom made up of three or more rows of petals. Some authorities declare that a cruciform flower is more difficult to "double" than one of more preliminary petals; difficulties, however, but provoke enterprise.

Far longer than one can trace the wallflower has been loved as a poetic as well as a homely beauty; in the Middle Ages it was worn by wandering minstrels and troubadours, sprays being treasured during their travels, and shown again, on their return, to the great lady patronesses who had bestowed them, no doubt accompanied by some more substantial guerdon. The poet tells us,

> "An emblem true thou art
> Of love's enduring lustre, given
> To cheer a lonely heart";

and this has been interpreted as an allusion to the sheen that is found on the petals long after they have become dried and devoid of real colour. Symbolical of fidelity in misfortune, it is found filling up rents and chasms of deserted buildings, giving warm colour to scenes that would otherwise be too coldly grey.

There is, of course, a good dwarf single strain of wallflowers that proves of value in beds, but the height is variable, ranging from six to nine inches; the habit is stiff in the extreme, although the colours are often gloriously diversified. Vulcan is a nine-inch crimson, and Golden Tom Thumb is generally employed; Dwarf Ruby Gem supplies a want, too, yet none of these are graceful; after severe spells of spring east winds the lowest leaves often wither and fall, leaving the plant shaped like a miniature cabbage, showing bare understem and a far too compact head. One gardener known to me makes a point of growing his wallflowers for bedding in rows under a south wall all winter, with lines of bricks in between, upon which lights can be laid in frosty weather; a line of wood, like a low fence, shuts off the wind from the east, and these plants are only put into the beds in March when about to bloom. Lifting is done after a thorough soaking of the soil, each plant being so moved that it is slipped into its new quarters with ball of earth intact. The enormous work involved would deter most flower cultivators from adopting this method; still, the perfection of foliage as well as blossom that results commends it highly to all who desire an extra good display.

The wallflower is a native of Switzerland, as also of the colder parts of France and Spain, as well as of England; by means of seed scattering on the hilly bare bits of ground of some large estates, against banks between fields, on the margins of old gravel pits and stony gorges, very beautiful effects could easily be gained, and the harvest would be self-repeated year after year, provided the blossoms could, some of them, be preserved from trespassing pickers. The tall sorts would be most suitable, especially,

> "The yellow wallflower, stained with iron-
> brown";

while some seed of Cheiranthus kewensis, the winter bloomer, should be included; this would ensure late autumn blossoms in the landscape, possibly also December flowers unfolding in the sheltered nooks.

The connection between the families of wallflowers and stocks is interestingly made visible in the foliage of the wallflowered-leaved ten week strain of the latter. The annual wallflowers have come to supply a real want of those floriculturists who wish to keep one kind of blossom with them all the year, sharing the opinion in this case of the poet Moir:

> "Sweet wallflower! Sweet wallflowers!
> Thou conjurest up to me
> Full many a soft and sunny hour
> Of boyhood's thoughtless glee;
> When joy from out the daisies grew
> In woodland pastures green,
> And summer skies were far more blue
> Than since they ere have been.
> Rich is the pink, the lily gay;
> The rose is summer's guest;
> Bland are thy charms when these decay,
> As flowers first, last, and best.
> There may be grander in the bower,
> And statelier on the tree;
> But wallflower, loved wallflower,
> Thou art the flower for me!"

White Dame is a variety that should be more grown; used with a vivid red variety it gives a new spring combination in beds, recalling the stronger scarlet and purer white combination that summer always offers in one part of the garden or another, but which no early flowers create, excepting those that Anemone fulgens, tulips, and hyacinths produce among the bulbous plants. White Dame is also charming with the salmon-red Eastern Queen, or buff-salmon Aurora, with Cloth of Gold or Ruby Gem; a newer sort is White Gem.

Cheiranthus alpinus seems to call for attention as a wallflower that should accompany the other types in the beds, edging them or forming a rather high carpet; this, although some scientists class it among the erysimums, Cheiranthus Marshalli is such a grand orange that it merits far more patronage as a bedding plant, but it grows often to a height of eighteen inches.

The practice of not sowing wallflowers until June is one to be severely condemned; March is the month, the seedlings having a more compact habit if twice or thrice transplanted. Whether the true elegance of the plant is not interfered with by all so-called improvement in this respect may be seriously questioned however, and, now that even bedding arrangements are expected to be artistic, and show the natural beauty of the subjects used, it seems that bushy, rather than graceful, wallflowers, are out of date. Probably the loose branching form, reaching high, tapering its bud sprays, waving in the least breeze, is the one that will soon be demanded. Cheiranthus mutabilis, the three-feet herbaceous plant, offering great stems adorned by yellowish flowers, flushed with rose, mottled with cream, passing into brown, or sometimes half ochre-yellow, half chestnut, stands alone at present as a fragrant wallflower of absolutely perfect grace. Seed scattered in March of all varieties in mixture, will result in a field of glorious colour, and no work be needed but judicious thinning. This is a grand way to beautify either a border or large bed. **M. H.**

WORK FOR THE WEEK.

THE ORCHID HOUSES.

DECIDUOUS DENDROBIUMS. — The bulk of the plants of the deciduous section of dendrobiums will now be producing their flower buds from the nodes of the pseudo-bulbs. Care must be observed in the early stages of development not to treat the plants too liberally. It is best where only sufficient encouragement is given to keep the pseudo-bulbs plump until the flower buds are distinctly observed. In bright weather the plants may be lightly sprayed overhead, and this will, to some extent, counteract drought at the roots. It is advisable to keep the atmosphere reasonably dry, especially so at night. Keep all plants that are producing their flowers in a light position; no shading is necessary until the flowers have become expanded, and the plants should then be removed to a cooler and drier atmosphere, as this will considerably increase the duration of the flowers, and if the plants are required for decorative purposes in the house they are not so liable to injury as would be the case if taken direct from their warm quarters.

POTTING.—As they pass out of flower any repotting necessary may be attended to. I certainly think the repotting of this section of dendrobes should not be delayed after the new roots make their appearance from the base of the young growth. The plants should not be disturbed more frequently than is absolutely necessary, and where good lasting material is used as a potting compost some of the kinds will often do well for years practically undisturbed. The whole stock should be overhauled at the proper potting season, as drainage must be kept in order, or there is a danger of stagnation at the season when the plants require well-nigh saturated conditions both at the roots and in the atmosphere. Use equal proportions of osmunda fibre, fibrous peat, and chopped sphagnum, with sufficient sand or finely broken crocks intermixed to render the compost porous. Avoid having the receptacle too large, and care must be observed not to have too great a bulk of potting material about the roots. Plants that are not repotted will require to have the surface moss removed and living sphagnum added. Water with soft water at all times and place the plants under growing conditions as soon as potting is completed.

PROPAGATION.—To increase the stock any of the back pseudo-bulbs may be cut off, and if these are placed on a bed of sphagnum moss, or in a propagating case, growth buds will generally push out. As soon as these have begun to root cut away a portion of the pseudo-bulb on each side of the growth, and put them into small pots in a compost of chopped sphagnum moss and sand. Another method is to cut the pseudo-bulbs into lengths of about three nodes each, and insert them as cuttings in a compost of moss and sand. Place these in a hot, humid atmosphere, and they quickly produce young growths.—H. J. Chapman, Oakwood Gardens

THE FLOWER GARDEN.

THE ROSE GARDEN justly claims our attention at all times, for it would be difficult, if not impossible, to overestimate the value or overpraise the beauty of the "Queen of Flowers." Even during the dull days of winter there is work to be done "among the roses," and this, if sometimes arduous, is lightened by the anticipation of the glory and fragrance of summer. To possess a garden without a rose would scarcely be tolerated nowadays even by the humblest cottager. It is not our intention to deal exhaustively with the planting of roses in the present calendar, that operation usually being done during the months of October and November, on heavy soils the former month being preferable, the plants thereby having a better chance of becoming semi-established before the advent of cold rains or wintry weather. On lighter soils November is undoubtedly the best month of the year during which this important operation should be carried out. In exposed places protection for the more tender varieties of teas is undoubtedly necessary. The base of the plants should receive special care in this respect, or many losses will occur during a spell of sharp weather such as we have recently experienced. Standard roses, especially the drooping kinds, with large, heavy heads, must be staked and made secure against any havoc that might otherwise be caused by a sudden gale or a continuation of stormy weather.

CLIMBING ROSES are to-day receiving more attention than formerly, their value as a natural tree covering becoming more and more appreciated. Many an otherwise unsightly stump or bare trunk might be made an object of beauty by the judicious use of roses of this type. These, when planted in such positions, should be allowed to ramble at will, little, if any, pruning being required beyond the cutting away of old or decaying growths. By the side of woodland walks, or other parts of the wild garden, such varieties as Longworth Rambler, Carmine Pillar, or Dundee Rambler will add a touch of colour and beauty in these out of the way places not otherwise obtainable, and by so doing we aid nature in making our woodland surroundings more beautiful than before.

PEGGING DOWN of roses is a form of culture adopted by some, and this method certainly has its advantages when judiciously carried out, as the plants cover the surface of the beds much sooner than when the usual system of close pruning is resorted to, and at the same time a larger number of blooms are produced, although this may be at the expense of size; but the latter is not always a desirable quality in a rose bloom required for decorative purposes only, and not for exhibition. Such varieties as Clio, Frau Karl Druschki, Madame Gabriel Luizet, Margaret Dickson, Mrs. John Laing, Captain Hayward, La France, Marie Van Houtte, Madame Lambard, William Allen Richardson, and Madame Caroline Kuster, in fact, any vigorous growing variety of either H.P.'s, teas, or noisettes, lend themselves admirably to this method of cultivation, which might be carried out forthwith should the weather be favourable. On no account attempt the bending over and pegging down of the growths during frosty weather, or breakages will occur, and the plants become permanently disfigured. Cover the surface of the ground as evenly as possible, gradually bending the growths into the required positions.—W. Hedley Warren, Aston Clinton Gardens.

CONSERVATORY AND GREENHOUSE.

BOUVARDIAS. — Those that have been resting for a time in a cool house may now be cut back, cleaned, and placed in a moderately warm atmosphere, where they will soon make plenty of young growths to provide cuttings. If preferred, the larger pieces of root may be taken off, cut up into small pieces, and placed in pans in the propagating frame, and when they have commenced to grow these may be potted up and grown on with the rest of the young stock in a light sandy soil with plenty of leaf-soil for the first potting, after which a rather stronger compost will be best.

FERNS.—These will now be pushing up young fronds, and need attention. Nephrolepis are among the earliest, and are very useful ferns for many purposes, some making good basket plants, and proving very useful also for planting in cork pockets on walls. The old Nephrolepis exaltata thrives almost anywhere. Some of the newer varieties are beautiful, notably, N. todeaoides, N. Whitmanni, N. Piersoni, and N. elegantissima. Many of the nephrolepis are strong growers, and require feeding when the pots are filled with roots. Ferns cannot be maintained in a healthy condition if kept in a dry atmosphere. A good many ferns treated as stove plants would, after growth is made, be much healthier if kept in a cooler house. After ferns are potted maintain a moist atmosphere, with a temperature of 60 deg, damping underneath the staging morning and evening and admitting a little air on sunny days as the temperature rises.

PALMS.—Work in connection with re-potting and top-dressing of palms used in the warm greenhouse and conservatory may now be taken in hand. It is fairly well known that palms will thrive better and keep in a much healthier state in small pots than in very large ones, if the plants are healthy, and there is room to supply plenty of water for the roots. There is no need to pot them, always providing they are fed regularly with some good artificial manure, and the roots never lack water. These remarks apply principally to the stronger growing phœnix, coryphas, kentias, etc., most of which are used for decorative purposes. When potting ram the soil firmly with a beater, as this keeps the plants from rising out of the pots. Should the leaves be in any way dirty with scale or dust some soft soap dissolved in warm water is useful for cleaning them.—W. Staward, Belford Hall Gardens.

HARDY FRUITS.

PLANTING.—Owing to the heavy storms of rain and hail, as well as frost, it has been impossible to undertake any of this work for the past week or two. However, we hope for more congenial weather before many days are past. I have planted large quantities of fruit trees in the gardens here late into March, but this would not be found successful in every locality. It is advisable that as soon as the soil is in a good condition for planting, trees should be placed in their permanent quarters without delay. In the meantime, see that all materials necessary are in readiness, so that planting may be carried out expeditiously; pay particular attention after planting the trees to staking, tying, and mulching with stable litter around the trees as far as the roots extend.

PRUNING.—This should be finished as soon as possible. The work of pruning large fruit plantations is a tedious operation, and one that requires perseverance so that the work may be finished in good time. Any apples, pears, or plums which are planted at this season of the year should be pruned in the ordinary way; shorten the leading growths according to the ripeness of the wood, and spur-prune the side shoots back to two or three buds. Some growers do not advocate this method of pruning trees when they are planted late in the season, but we have adopted it here for some years past, and it has proved satisfactory. At the same time, what has been proved to be a success in one locality has turned out an absolute failure in another. Cherries that have been newly planted should not have their leading shoots shortened; the method to adopt is to cut to two or three buds any superfluous wood that is not required to build up the foundation of a good tree. These remarks are also applicable to newly planted peach and nectarine trees.

ORCHARDS.—It is not usual to annually prune the orchard planted trees, but in many instances the trees are greatly benefited by the judicious use of the pruning saw and knife, to thin out the cross branches and open out the trees to allow the sun and air to penetrate. This is very essential when the branches have become densely crowded, as the young wood becomes much better ripened, produces more fruit buds, and consequently yields heavier crops and better fruits. No grass should be allowed to grow close to the stems of young trees; when planted in the grass we leave a clear distance of two feet around the stems for three or four years, until the trees have become well established. All trees should be well protected from cattle and sheep. If not already done, tree-guards, or whatever protection is used, should be examined and made secure. Hedges around orchards should be cut, and banks made good, so as to give a neat appearance to the place.—H. Farmer, Cardiff Castle Gardens.

R.H.S. EXAMINATION OF EMPLOYEES IN PUBLIC PARKS.

The Royal Horticultural Society's fourth examination of employees in public parks was held on January 10, 1910.

As previously, the examination was partly viva voce and partly written, occupying three hours and twenty minutes. It was held at the Society's Hall in Vincent Square, Westminster.

Ninety-one candidates entered, and of these thirty-one secured places in the first class, twenty-six in the second, and twenty-five in the third, leaving only nine candidates who have failed altogether to satisfy the examiners. The number of entrants was smaller than for some years past, but this was anticipated, for the majority of the London parks gardeners had already secured positions in the pass lists. It is hoped that more candidates will in future years be sent from the public parks and gardens of the many cities and towns of the provinces.

Speaking generally, the results of this year's examination are above the average, and in a few cases very high marks have been obtained. There was less tendency in the answers to give information not asked for in the questions, but there is still a noticeable lack of understanding of many simple garden terms, such as "indigenous," "alluvial," etc. Although instructed in prominent black letters at the head of the questions, some candidates did not attempt the compulsory question xvi., asking for a description of the public park or garden in which they work, and they have only themselves to thank for the number of marks thereby necessarily lost.

Greater knowledge was shown in the choice of ornamental deciduous trees suitable for planting round the margins of lakes, etc., the selections being both good and varied; the botanical names also were for the most part correctly quoted—an indication that winter evening hours had not been neglected. The selection of plants for a well-coloured autumn border was in most cases excellent, but the sketch plans for the arrangement of the plants showed a great want of knowledge and observation of the precise value and habit of different varieties, and also of colour harmony. There was also much indecision of mind as to evergreen and deciduous shrubs, instead of a clear, well-defined knowledge as to the exact qualities which constitute the line dividing the two. Very rarely was a good selection of "effective evergreen flowering shrubs" given. Similar confusion existed as to which are our own reputedly native British trees, introductions from all parts of the world being included in the answers. The original source of trees and plants should be made a subject of study, as such knowledge is in many cases quite indispensable in understanding their varying requirements and the treatment. The chemistry of the soil also deserves greater study, some candidates giving oxygen, nitrogen, mildew, and moss as examples of the constituents of plant ash found in soils.

It is hoped that all candidates low in the list will not be disheartened, but encouraged, by the greater success of their fellows, to work on to higher places next year. With so encouraging a report as only nine actual failures there is every hope for those who have only won a third class to work up to the second, and the second up to the first class. And with patient endeavour and careful observation, coupled with intelligent inquiry into the reasons and causes for what is done and observed during the coming season, much progress should be made and useful knowledge stored up in readiness not only for the next examination, in January, 1911, but to be put into practice during the whole of life's work.

It should perhaps be put on record that there is absolutely no difference of merit whatever in being placed in Division A or in Division B. A first class in one is as good as a first class in the other. The two divisions are only kept up for the convenience of certain public authorities.

C. R. FIELDER,
OWEN THOMAS,
JOHN W. ODELL,
W. CRUMP,
EDWARD WHITE,
GEORGE GORDON,
E. BECKETT,
W. WILKS,
Examiners.

The following are the candidates who were successful in taking a first class in the two divisions.

DIVISION A.

1. Alfred J. West, 23a, Oaksford Avenue, Sydenham.
2. E. Drage, 48, Emmett Street, Mile End.
3. W. A. Hodge, White Lodge, Victoria Park, N.E.

DIVISION B.

1. Percy G. Butcher, 2, Luxford Street, Rotherhithe.
2. H. W. Hotten, 22, Christie Road, South Hackney.
3. T. J. Middlemiss, 51, Clement's Road, Bermondsey.
4. G. Illman, 27, North Road, Highgate.
5. S. Ashmore, 154, Bury Street, Lower Edmonton.
6. C. Oldham, 69, Gloucester Road, Kew; P. E. Holder, 49, Durham Road, West Green.
8. A. Chipperfield, 502, Southwark Park Road, Rotherhithe.
9. H. Ellott, 202, Crystal Palace Road, East Dulwich.
10. J. D. Snowden, 21, Alexandra Road, Richmond; James Parker, 29, Northcote Road, Longlands, Sidcup.
12. W. J. White, 56, Branksome Road, Brixton; W. Bland, 119, Salop Road, Walthamstow.
14. G. Ottaway, 128, Dartmouth Park Hill, N.
15. W. R. Lee, 97, Abbott Road, Poplar; H. W. Webb, 49, Vespan Road, Shepherd's Bush; J. E. Ringe, 7, Freeland Street, Battersea.
18. C. H. Walkden, 95, Herne Hill Road, S.E.
19. F. W. G. Sirett, 13f Block, Peabody's Buildings, Herne Hill.
20. H. G. White, 8, Albion Gardens, Hammersmith.
21 W. J. Musk, 11, Layer's Road, Stoke Newington; H. R. Medlock, 134, Green Street, Forest Gate.
23. J. C. White, 29, Bowdale Road, Lordship Lane.
24. J. Hyde, 62, Langdon Road, Upper Holloway.
25. E. Featherstone, 62, Strahan Road, Bow.
26. Robert Smith, 86, Hawksley Road, Stoke Newington; D. Coffey, 6, Halon's Road, Eltham.
23. T. J. Jenner, 13, Gretton Houses, Bethnal Green.

Bequest to New York Botanic Garden.—The late Mr. D. Ogden Mills bequeathed £10,000 to the New York Botanical Garden, and £20,000 to the American Museum of Natural History.

Wild Flowers in the Garden.—The newly-formed Elstree and Boreham Wood Horticultural Society has arranged a series of lectures on various topics as part of its programme, and was fortunate in having as its lecturer on Tuesday evening last Mr. J. W. Odell, of Stanmore, who gave a most interesting discourse on "British Wild Flowers in the Garden," illustrated by a capital series of lantern slides, many of them taken in the immediate neighbourhood, thus affording additional interest to the lecture, and pleasure to the large and appreciative audience present. Mr. J. W. Odell is widely known as a pastmaster on this particular subject, and his excellent, interesting, and instructive lecture was heartily applauded.

SHROPSHIRE HORTICULTURAL SOCIETY.
The Schedules for 1910 SPRING and SUMMER SHOWS are now ready, and copies will be forwarded on application to the undersigned.
H. W. ADNITT, } Hon. Secs.
W. W. NAUNTON,
Shrewsbury,
Feb., 1910.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Gardeners' Orphan Fund.

In the unavoidable absence, through illness, of Mr. H. B. May, the annual meeting of this charity, held at Simpson's, 101, Strand, at three o'clock on Friday, February 11, was presided over by Mr. Wm. Poupart.

There was a very small attendance, those present being Messrs. W. Poupart, Alderson, Wynne, Bates, G. Gordon, J. McLeod, W. Moorman, R. H. Pearson, W. Howe, J. Lyne, T. W. Sanders, J. Pearce, G. Caselton, and G. Reynolds, all of whom took some brief part in the proceedings.

After the notice convening the meeting, and the minutes had been read, the Chairman read a letter from Mr. H. B. May, explaining the latter's absence through indisposition. A letter of sympathy, with best wishes was sent to Mr. May from the meeting.

The report and balance-sheet were taken as read, and are as follows:—

Report of the Committee for 1909.

The executive committee in this their twenty-first annual report have to state, with great regret, that they are unable to congratulate the supporters of the fund on the maintenance of the year's receipts at the high level attained in 1908, although if certain generous gifts made in that year to mark the coming of age of the fund be eliminated, a comparison of the accounts presented show that the regular income has been maintained—indeed, slightly increased. This the committee consider most satisfactory and hopeful for the future, having regard to the fact that they, in common with the management of all charitable institutions, have had to experience an exceedingly anxious time. The net revenue of the year has, however, for the first time in the history of the fund, been insufficient to meet the sum voted for allowances to the children. It will be in the recollection of the subscribers that at the last annual meeting a special wish was expressed that the success of the coming of age festival should be celebrated by the election of all the candidates, twenty-five in number, and this was done, the committee believing at the time that a larger measure of support would be forthcoming to justify the increased expenditure. Their anticipation has hardly been realised by the results, and hence it is that while the committee would have been glad if the whole of the nineteen candidates could have been placed on the fund to-day, prudence compels them to limit the number to fifteen, in the hope that by another year they will have been provided with the means to increase the number of beneficiaries.

At the commencement of the year 104 children were receiving the full benefits of the fund, and to 27 candidates awaiting election compassionate allowances were being made, so great was their need of assistance. At the annual meeting twenty-five were added to the full pay roll, bringing the number on the books to 131. The total sum disbursed among the children during the year was £1,716 2s. 6d., or an increase on the previous year's allowances of £94 15s. The number of children elected to receive the benefits of the fund since its foundation is 278, and the total expenditure in weekly allowances and special grants made during the same period is £21,222.

The annual festival, held at the Hotel Cecil on May 6, under the presidency of His Grace the Duke of Rutland, again proved both socially and financially a gratifying success, and greatly benefited the charity. To the noble chairman, who so ably pleaded the cause of the fund and its need of the generous support of all lovers of gardens and gardening, the committee gratefully tender their heartiest thanks, and ask the subscribers this day to still further mark their appreciation of his kindness by electing him a vice-president. The committee also gladly and cordially tender their best thanks to the stewards, who by their collections so materially increased the total amount of the chairman's list, and to all who so kindly, by gifts of flowers and loans of plants on that occasion, rendered the Victoria Hall so beautiful and so pleasing to the visitors.

With regard to the next festival the committee have the pleasure to announce that arrangements have been made for that annual function to take place at the Hotel Cecil on Thursday, May 19, and it affords them the greatest gratification, also, to know that they will have in the chair on that occasion such an enthusiastic lover and patron of horticulture as Sir Jeremiah Colman, Bart., D.L., J.P., of Gatton Park, Surrey. In the interest of the fund and for the credit of horticulture, the committee sincerely hope that they will have the support of all well-wishers of the fund on that occasion.

The committee once more very gratefully acknowledge their large indebtedness for generous benefactions to Mr. N. N. Sherwood and his sons, Sir Frank Crisp, Mr. Leonard Sutton, Messrs. N. M. Rothschild and Sons, Mr. Leopold de Rothschild, Baron Schröder, Mr. Harry J. Veitch, Mr. Anthony Waterer, and other constant supporters.

The committee also gratefully acknowledge the receipt of a legacy of £5 left by Mrs. Anne Clayton, wife of Mr. Henry J. Clayton, Wharfe Bank House, Ulleskelf, and formerly gardener at Grimston Park, Tadcaster, "in remembrance of her husband's early connection with the fund."

To the members of the Chesterfield Chrysanthemum Society, the Leeds Paxton Society, the Bradford Chrysanthemum Society, the Reading Gardeners' Mutual Improvement Society, the Reigate Chrysanthemum Society, the Tonbridge Gardeners' Society, the Scottish Horticultural Association, the Wargrave Gardeners' Society, and the Chislehurst Gardeners' Society, very hearty thanks are due for much valuable assistance received.

New local secretaries have been appointed during the year at Leeds and Worcester. At Worcester Mr. Topham initiated a whist drive, with the most gratifying results; while Mr. Carver, assisted by several fellow gardeners in the Leeds district, organised a spring flower show which brought a welcome contribution to the fund, and very materially helped to make the claims of the charity more widely known in that part of Yorkshire. To these and all the other local secretaries the cordial thanks of the committee are heartily accorded.

With sincere regret the committee have to deplore the loss sustained by the fund by the death of such good workers on its behalf as Mr. William Roupell, Mr. Peter Barr, and Mr. Peter E. Kay, all of whom had served on the committee. Mr. Roupell and Mr. Barr were elected to serve on the original committee, and Mr. Roupell retained his seat until his death, ever a courteous, kind, and enthusiastic colleague. On the death of Mr. Roupell the committee unanimously appointed Mr. Edmund Rochford, a generous supporter of the fund, to the vacant seat. By the greatly lamented death of Mr. J. H. Vallance, the hon. local secretary for Bristol and district, the fund has also sustained a heavy loss.

The members of the committee who retire by rotation are Mr. William H. Cutbush, Mr. George Gordon, Mr. D. Ingamells, Mr. J. F. McLeod, Mr. R. Hooper Pearson, and Mr. E. Rochford, and who, being eligible, offer themselves for re-election. To fill the seats vacated by the resignations of Mr. William Bull and Mr. Parsons, the committee recommend the election of Mr. Archibald R. Allan, gardener to Lord Hillingdon, Hillingdon Place, Uxbridge, and Mr. H. L. Wright, of the firm of Messrs. Parsons and Co., fruit salesmen, Covent Garden.

The committee again desire to place on record their high appreciation of the valuable services rendered by the auditors, Mr. P. Rudolph Barr, and Mr. M. Rowan. Mr. Rowan is the retiring auditor, and having examined the accounts for some years and being thoroughly conversant with the working details of the fund, his re-election is cordially recommended.

CASH STATEMENT FOR 1909.

P. RUDOLPH BARR, } Auditors.
M. ROWAN,

January 17th, 1910.

Mr. W. Poupart, in a very few words, moved the adoption of the report and balance-sheet, and Mr. G. Gordon seconded the motion, expressing his regret that country subscribers and friends were conspicuous by their absence. Carried unanimously.

Hearty thanks were accorded to the Duke of Rutland for presiding at the annual festival dinner, and he was elected a vice-president. Mr. Edward Sherwood was thanked for past services and re-elected treasurer for the ensuing year. Mr. Rowan was also thanked and re-elected as auditor. The retiring members of committee, Messrs. W. Cutbush, G. Gordon, D. Ingamells, J. F. McLeod, R. H. Pearson, and E. Rochford were re-elected and thanked for past services. Two new members of committee, Messrs. A. Allan and Mr. H. L. Wright, were elected in place of Messrs. Bull and Parsons, resigned. Mr. Brian Wynne, on the motion of the Chairman and Mr. Bates, was re-elected secretary at the usual salary.

Messrs. Bates, Lyne, Ingamells, Poupart, Alderson, and Moorman were appointed scrutineers of the ballot, and the meeting was then adjourned until half-past four for the declaration of the poll.

The poll was declared at the time stated, and the scrutineers read the list of successful candidates, as follows: Ivy Lilian Foster (409 votes), Violet Powell Williams (319), James A. C. Walker (280), Elsie Mary Sage (280), Dorothy Sage (268), Jack Spratt (268), F. Atkinson (257), Annie B. Glide (229), Fred G. Evans (225), Mary I. Dickson (220), Grace J. Gillies (213), David Dickson (200), Harry Johnson (180), Ernest Stead (175), and John W. Gough (172). These were declared duly elected, and votes of thanks to scrutineers and chairman brought the proceedings to a close.

In the evening about thirty friends and members of committee dined together, under the genial presidency of Mr. N. N. Sherwood, V.M.H.

British Gardeners' Association (London Branch).

The monthly meeting took place at Carr's Restaurant on Thursday, February 10, when Mr. T. W. Winter presided. In spite of inclement weather, there was an attendance of over fifty members.

The principal event of the evening was a lantern lecture delivered by Mr. E. F. Hawes, entitled, "The Value of Botany to Gardeners." Mr. Hawes first demonstrated the root system of plants by showing upon the screen seedling plants of wheat and cress. The lecturer explained how the roots ramify the soil in search of food materials, found these in solution, and absorbed them by means of root hairs situated close behind the growing point, and how the food was conducted through the tissues of the plants by osmosis. Mr. Hawes, contended that the advantage of a knowledge of the structure of roots to gardeners was that it enabled them to realise more fully than they might otherwise do, the necessity of providing plants with a suitable rooting medium, and of keeping this regularly supplied with moisture, as once plants are allowed to become dry, the delicate root hairs, which are alone capable of absorbing water and food material, would die back, and the plant thus receive a check.

The stems of plants were next dealt with, examples of the vascular system of both di- and mono-cotyledons were shown, and the uses of the different parts explained. Transverse sections of leaves to illustrate the uses of the foliar organs showed the chlorophyll granules, which give to leaves and stems their characteristic green appearance, and which carry on the important work, through the agency of the sun's light and heat, of converting the inorganic materials supplied by the roots into the highly complex compounds required for the nourishment and growth of the whole plant. The little pores or stomates on the lower sides of the leaves carry out the function of transpiration and respiration and also assist in the work of assimilation by taking in the carbon dioxide from the atmosphere. The lecturer emphasised the value of good healthy foliage to plants by pointing out the vital processes leaves perform, and which can only be properly carried out when the plants are provided with the necessary amount of light and air. The life histories of plants were well illustrated by examples of cryptogams, gymnosperms, and angiosperms. Adaptation to environment was explained by reference to such examples as gorse and blackthorn, which lose their spiny nature when cultivated under glass, and produce spines again when placed under natural conditions. Slides showing the habit of climbing plants proved very interesting and instructive, as also did the pictures showing the methods of such parasitic plants as dodder in attaching themselves to the host plant by means of their haustoria. In conclusion, Mr. Hawes said he thought that a knowledge of botany could not fail to be of service to gardeners, as it would enable them to understand their plants better and know their natural requirements; a knowledge of botany would also stimulate a gardener's interest, convince him more of the dignity of his profession, and help him to understand the whys and wherefores of many things usually done by rule of thumb.

Mr. Winter, in proposing a vote of thanks to Mr. Hawes for his lecture, expressed his personal appreciation, and said he felt sure that everyone present shared his opinion that Mr. Hawes had dealt with his subject in a thoroughly practical manner.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, February 8.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Messrs. A. W. Hill, A. D. Michael, L. Crawshay, J. Douglas, G. Massee, W. Cuthbertson, W. Hales, G. Gordon, A. Worsley, J. W. Odell, R. H. Pearson, C. T. Druery, J. Fraser, and F. J. Chittenden (hon. secretary).

SEEDLING CYCLAMENS.—Mr. Herbert Chapman, Rye, showed a large number of seedlings raised from seed of Cyclamen ibericum roseum, which had been pollinated (without previous castration) with pollen of C. latifolium. The seedlings flowered earlier than seedlings raised from C. ibericum roseum pollinated with its own pollen, and the flowers were larger than those of the seed parent, but otherwise they showed no sign of hybrid origin. Mr. Chapman is carrying on further work with these plants.

VARIATION IN CYCLAMEN LATIFOLIUM (PERSICUM).—Several plants of the greenhouse cyclamen were exhibited by Mr. A. W. Sutton to illustrate new strains of this very variable plant. A plant of the common type was shown to compare with them. The flowers included a large-flowered almost magenta one with broad fringed petals; a white flower with fringed petals, red at the throat and tipped with pink; a pink flower with very slightly frilled petals undulate at the edges, red at the throat, and tipped with deep pink; and others varying from white to deep rose and fringed to a greater or less extent.

VARIATION IN CROCUS CHRYSANTHUS.—Mr. Bowles showed a long series of flowers of seedlings raised from Crocus chrysanthus, illustrating the enormous range of colours in the flowers of this species. He said the range was so great as to render it practically impossible to separate C. chrysanthus from C. biflorus.

FUNGUS ON PHLOX.—Mr. A. Kingsmill, of Harrow Weald, sent a plant of Phlox Nelsoni infested in its lower parts with a fungus which Mr. Massee identified as Soppittiella sebacea.

MALFORMATION IN PRIMULA SINENSIS.—From Mr. Etherington, of West Bank Gardens, Lewisham, came some specimens of Primula sinensis (stellata) with numerous dwarf flowers at the base of the umbel. Mr. Crawshay took the plants for further investigation.

FASCIATION IN RUSSELIA JUNCEA.—Mr. W. H. Patterson, of St. Vincent, W. Indies, sent an interesting case of fasciation in Russelia juncea. As Mr. Patterson remarked, fasciation, though a very common phenomenon, is rare in xerophytic plants. In the present case the plant had, however, not been growing under normal xerophytic conditions, but had been in garden soil and received more water and earth salts than usual.

BULBS FAILING. — A number of hyacinths were sent, in which the roots were either entirely wanting or were much decayed. Although both eelworms and bulb mites were present, their numbers were so small and the appearance of the bulbs so much unlike the damage done by these pests that the committee thought the failure of the roots must have been due to some such cause as too great a supply of moisture in the soil when the roots were first formed, which led to their suffocation and decay.

Beckenham Horticultural Society.

At the monthly meeting, Councillor Sutton presiding, Mr. John Gregory, of Croydon, with the aid of the limelight and nearly 100 slides (prepared by himself from his own photographs), conducted the large audience to many notable gardens. In some cases only a flying visit was made; at others a prolonged stay was made. Gunnersbury House, Munstead House, Falkland Park, Lamport Hall, Althorp, etc., etc., were laid under contribution. In addition to the landscape views, herbaceous borders, roseries, rockeries, etc., some pictures of rare orchids were put on the screen, and others not so rare, but bearing the impress of skilful cultivation. Among the latter were Dendrobium Pierardi, finely grown by Mr. Gregory; and a fine example of Cypripedium insigne carrying 91 flowers in a 9-inch pot, grown by a member of the society. Mr. Gregory was accorded a hearty vote of thanks at the close of the lecture.

East Anglian Horticultural Society.

This society opened its 1910 session on Wednesday at Norwich, when Mr. E. G. Creek, of the Ipswich Gardeners' Association, read a paper upon "Violets." In his remarks, Mr. Creek proved himself a master of the subject, and clearly explained how best to prepare the plants for a fine winter display of bloom. The methods of propagation and subsequent treatment up to placing the plants in the frame were ably dealt with, as were also soils and position. Discussion was invited, this being opened by Mr. H. Read, Drayton, a very large trade grower of this flower. He contended that the blooms opened better, and lasted much longer when grown upon light soils. He stated also that a lot of dampness and mildew was brought about by not thoroughly watering the plants in at first. Mr. L. Smith, Shotesham Park Gardens, gave some appropriate remarks, especially dealing with outdoor culture. Messrs. C. Matthews, C. H. Fox, J. Powley, and the president, Mr. T. B. Field, also gave their views of the subject.

The display of exhibits was most creditable in all sections. Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, brought up a grand cypripedium and a display of calanthe blooms; Mr. F. Williams, gardener to Louis Tillett, Esq., Catton, evidenced his capabilities of bulb culture in pots by some extra good hyacinths, tulips, and narcissi. Mr. W. Rush, The Fernery, Thorpe, also had a fine display of these, and staged the best fern. In a class for cut flowers, Mr. W. Laws, gardener to G. E. White, Esq., Eaton, staged exceptionally fine blooms of winter-flowering carnations. Apples and pears constituted the fruit department, and there were some good examples of Brussels sprouts, onions, and potatoes in the vegetable section.

Birmingham Gardeners' Association.

The usual fortnightly meeting was held on the 7th inst., when Mr. Alexander D. Christie delivered an interesting address on "Afforestation of Waste Land; the Work of the State," accompanied by lantern slides showing a series of forest scenes and ancient trees. There was a good attendance, and at the commencement of the proceedings the Chairman (Mr. T. Humphreys) alluded to the death of the late Professor Wm. Hillhouse, of the Birmingham University, who was for many years president of the association, and almost invariably opened the spring and autumn sessions with some interesting subject pertaining to horticulture. The secretary was instructed to send a letter of condolence to Mrs. Hillhouse.

Mr. Christie's early life experience of forestry in Scotland and Russia qualified him to deal with the subject in an instructive manner, both from a cultural and utilitarian point of view. The subject was rendered additionally instructive by the organising secretary of the Midland Afforesting Association. Mr. P. E. Martineau gave a short talk upon the so far satisfactory progress that had been made in districts of the "Black Country," despite the peculiar atmospheric conditions contended with, and, with increased financial aid, he entertained an optimistic view of further success.

The Chairman in a few appropriate remarks invited a discussion, but the time available only permitted of Messrs. G. H. Thompson, of Walsall, W. Gardiner, and A. R. Brown speaking. Votes of thanks concluded the proceedings.

Reading Gardeners' Association,

The regular fortnightly meeting of this association was held in the Abbey Hall on Monday, February 7, when the President, Mr. Alderman Parfitt, J.P., occupied the

BOULTON & PAUL, LTD., HORTICULTURAL BUILDERS, Norwich.

EFFECTIVE, PRACTICAL CONSERVATORIES.

Ladies and Gentlemen waited upon by appointment

HEATING APPARATUS installed by experienced workmen in Horticultural, Public, and Private Buildings.

GARDEN FRAMES in Great Variety always in Stock.

No. 49A.—Span, 10ft. by 8ft. £11 10 0
No. 47A.—Lean-to, 10ft. by 7ft. £8 10 0
These Houses are sent out well made, painted three coats, Glazed 21oz. glass, and Carriage Paid.

CARRIAGE PAID on orders of 40/- value to most Goods Stations in England.

chair, there being again a large attendance. The minutes of the last meeting having been read by the hon. secretary, and confirmed, four new members were added to the society.

The lecturer for the evening was Mr. Seaman, The Gardens, Margery Hall, Reigate, representative from the Redhill and Reigate Gardeners' Mutual Improvement Association, on "Mushrooms and How to Grow Them." Mr. Seaman engaged the full attention of his audience from the commencement of his lecture, it being quickly apparent that he was a thorough master of his subject, and able, too, to impart his knowledge to his hearers.

Manure, the foundation of all mushroom beds, he remarked, was becoming every day more and more scarce, and, though gardeners in the neighbourhood of large towns were in a more fortunate position than their brethren in the country, yet they, too, found considerable difficulty in securing manure of suitable quality. Long wheat-straw from hard fed and hard worked horses was the material the lecturer liked best to secure. The longer straw being later available as a protection to the crop.

To obtain good reliable spawn was a most important thing, buying cheap spawn being only the forerunner of failure, and Mr. Seaman therefore advised the hearers to always purchase from a house with a reputation, English spawn being preferable to French.

Full details having been given as to the preparation and spawning of the beds, gathering the crops, etc., the lecturer gave some interesting particulars respecting the culture of mushrooms by a French firm in the galleries from which stone had been quarried, at Godstone.

Mr. F. Townsend, head gardener to the vice-president, staged a pretty group of freesias, which was much admired. A hearty vote of thanks to the lecturer concluded the evening.

Chester Paxton Society.

The first meeting for the winter session took place on the 5th inst., at the Grosvenor Museum, when a goodly number of members mustered to hear Mr. J. D. Siddall's lecture on "Round the Coast of Cardigan Bay." The lecturer very ably and pleasantly described the beautiful and romantic surroundings of the district of Cwm Bychan, Pwllheli, Barmouth, Dolgelly, Criccieth, Harlech, etc., his remarks being based on personal reminiscences of excursions made to these well known places. Additional interest was given to the lecture by a series of capital lantern pictures, which graphically portrayed the many places described. These were prepared from Mr. Siddall's own photographs. Mr. A. W. Armstrong officiated as chairman of the meeting.

The second meeting of the winter session took place on Saturday last at the Grosvenor Museum, under the chairmanship of Mr. E. Stubbs. Mr. Ernest Jones, of the Gladwyn Gardens, Gresford, read a carefully-prepared paper on "The Cultivation of Sweet Peas." This explained in detail the methods of culture adopted by the author, who is himself one of the most successful growers and exhibitors of this favourite flower in the district. His hints on preparing the soil, sowing the seed, planting out, and varieties to cultivate, were carefully noted by a large number of other enthusiastic growers who were present.

An interesting discussion followed the reading of the paper, in which several members took part, and, on the proposition of the Hon. Secretary (Mr. G. P. Miln), Mr. Jones was thanked for his instructive paper.

Bristol Gardeners' Association.

A well-attended meeting was held on February 10 at St. John's Parish Rooms, presided over by Dr. Shingleton Smith. A practical and highly educational paper upon "Indoor Ferns," was given by Mr. Halliburton, representative of Bath Debating Society. The lecturer proved to have a thorough knowledge of his subject, the experience obtained when in charge of the indoor ferns at Kew placing him in a position to be able to describe many kinds seldom seen in private collections, but all of which the lecturer recommended as useful subjects for the greenhouse. Mr. Halliburton said strong sunlight was detrimental, except for gymnogrammas. Abundance of water, with liquid manure, and soot water at intervals, suited most ferns, and spring was the best time for general potting. A very pretty effect might be produced, he said, by covering the brickwork of greenhouses with ferns and Rex begonias.

Dr. Smith opened the discussion, and mentioned the fact that in the coal measures there have been found over 900 kinds of tree ferns, only one of which now exists.

For two pots of freesias, Mr. Jennings was first, and Mr. Shelton second.

Professional Gardeners' Lodge.

The Professional Gardeners' Lodge of the Grand United Order of Oddfellows held its annual dinner at the Green Dragon Hotel, Leeds, on February 7, when Mr W. Green, J.P., presided over a good attendance. Among honorary members present were: The Lord Mayor of Leeds, Penrose-Green, Esq., Rowland Barron, Esq., M.P., the Rev. E. Swan, and the Grand Master of the Order, Mr. Winter, of Newcastle. The latter complimented the society upon its sound financial position.

During the evening the usual toasts were duly honoured, and interspersed with a good musical programme. A vote of thanks to the chairman, who is one of the society's oldest members, of 45 years' standing, terminated a most enjoyable evening.

This Lodge, formerly the Professional Gardeners' Friendly Benefit Society, has had during the year 1909 income amounting to £247 7s. 11½d., and expended £96 1s. 9d. in sick pay; £27 in funeral allowances; £27 7s. 6d. in management expenses, and various other items, leaving £67 10s. 9d. on deposit, and a cash balance of £21 13s. 10½d. The total assets of the society are invested funds amounting (with the cash balance) to the sum of £1,672 9s. 5½d.

Croydon Gardeners' Society.

"The Dressing of a Chrysanthemum Bloom for Exhibition" was the title of a lecture delivered before the members of this society on the 1st inst. by Mr. M. E. Mills, Coombe House Gardens. In the new syllabus of lectures for the present session, Mr. W. Collins', Croydon, name appears for a paper on "Chrysanthemums for Grouping," but owing to illness he was unable to keep his appointment, and to save disappointment, Mr. Mills generously filled the blank with an exceedingly interesting lecture and demonstration as above.

In the lecturer's opinion, there is just as much enthusiasm over the big blooms as ever, owing to the fascination of producing abnormal flowers and competing with other growers at the autumn shows. Accepting this opinion to be correct, it is for growers to learn all they can regarding their culture and treatment for the exhibition table; and it is here that the proper care is required, for many a good bloom can be doubly improved with a little judicious handling.

Treatment commences just before housing the plants by the careful removal of the bracts on the upper portion of the stem and below the bud. The wings of the leaves just below the bracts must be removed with a sharp knife, doing it thoroughly at first to prevent galling and a second operation. As the bud expands so the bracts appear, and close attention must be given to remove them, so that at last the colour of the flower is almost discernible. This removal forms a double purpose by throwing more vigour into the flower and depriving the black aphis of a resting home; also it greatly prevents the deformities in the flower, as it allows the petals to develop wthout hindrance or compression.

To get those huge blooms of either the Japanese or incurved varieties attention must be paid to the top of the flower, and the grower must call into requisition the tweezers and soft brush.

Mr. Mills detailed this operation, and with the aid of a big artficial flower he illustrated his remarks by operating on his specimen. Light and air form big items in the development of the big bloom, and oftentimes short petals must be removed to allow full expansion of others. In the centre of the bloom will be found small yellow florets, which are really the flowers of the plant, and these must be removed cleanly, afterwards enticing the long florets to grow in a symmetrical fashion, and this can be done with the aid of the tweezers, taking care not to bruise the petals in the operation. Varieties in the Japanese section differ so that no hard and fast rule can be laid down for their manipulation, but the grower must study the character of the bloom and use his own discretion.

Several questions were asked by the members at the conclusion of the lecture, and Mr. Mills very generously replied to them.

On the proposition of Mr. Oxtoby, seconded by Mr. A. May, a hearty vote of thanks was given to the lecturer, who had at such short notice come forward and filled what would otherwise have been a gap in the programme.

Mr. F. Oxtoby staged half-a-dozen well-flowered plants of primula The Pearl.

NEW PLANTS, ETC.

BRASSO-CATTLEYA WELLESLEYÆ.

This very beautiful bigeneric hybrid is derived from Brassavola glauca and Cattleya Mossiæ Wagneri. It is a good grower, and, as shown, carried two fine blooms (see Fig. on p. 123). The flower is wholly white, except for a pale lemon area on the lip. All the segments are of good size and wonderful substance, and the flowers are fragrant. A.M., R.H.S., February 8. Francis Wellesley, Esq. (gardener, Mr. W. Hopkins), Westfield, Woking.

DENDROBIUM DUCHESS OF ALBANY.

A charming dendrobium obtained by crossing D. Wiganianum, with D. Wiganæ xanthochilum. It is a free grower, and flowers well, producing clusters of fair-sized flowers that are white, except for a few purple marks on the side lobes of the lip, and a very faint yellow shading towards the apex of the lip. A very pretty hybrid. A.M., R.H.S., February 8. Sir Jeremiah Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate.

CYPRIPEDIUM LEEANUM EXCELSIOR.

A good form of this popular hybrid, and one with a broad flattened dorsal sepal; the green and purple colourings are deeper than usual. A.M., R.H.S., February 8. H J Bromilow, Esq., Rann Lea, Rainhill.

CATTLEYA PERCIVALIANA WESTONBIRT VAR.

In size and beauty of form this is the finest variety of the old, but now somewhat rare, Cattleya Percivaliana. In colour, too, it is especially fine, the purplish rose shade being very bright. The lip is deep red-purple, margined with pale blush, and veined with gold. A.M., R.H.S., February 8. Lieut.-Colonel Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester.

CRINUM PURPURASCENS.

An old species introduced from Old Calabar in 1826. It is of dwarf habit, and produces an umbel of from five to nine flowers—seven in the plant shown—and the flowers have elongated narrow segments, heavily shaded with deep purplish red. A.M., R.H.S., Sir Trevor Lawrence, Bart. (gardener, Mr. Bain), Burford Lodge Dorking.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

ALPINE PINKS.—N. V. J., Rochester: We propose dealing with this subject rather fully in our next issue.

WILD ORCHIDS AT DOVER.—P. B., Belfast: We have no personal acquaintance with the flora of the "White Cliffs of Dover," but we know quite well that in many of the chalk downs of Southern Kent several of the wild orchids abound, so that it would not in any sense be an extraordinary thing to find species growing on the Dover Cliffs.

SPECIAL EXHIBITIONS AT WESTMINSTER.—P. P., Chard: The special floricultural societies holding exhibitions at the Royal Horticultural Hall, Westminster, during the present year are as follows:—National Auricula and Primula Society, May 3; Perpetual Flowering Carnation Society and the National Tulip Society, both on May 19; National Sweet Pea Society, July 12 and 13; National Carnation and Picotee Society, July 26; and National Rose Society (Autumn Show), September 15. The National Vegetable Society holds its show on September 28.

CEROPEGIA WOODI.—J. M., Uttoxeter: This is a by no means rare plant, but it is one that is only cultivated in a few gardens. It needs stove treatment, and when grown in comparatively small pots suspended from the roof, or placed on a shelf where the growths can depend, it makes an interesting and pretty plant. It roots freely from the stems and also produces aerial tubers, so that propagation is an easy matter. Good drainage, a compost of equal parts peat, leaf-soil, sand, and loam will suit it, and when growing freely it needs plenty of moisture, but must be watered sparingly when not making new growth. It is sometimes used, just as selaginella and panicum are, for draping the edges of the stages in plant stoves.

WHITE SPECKS ON GRAPE VINES.—E. B., Manor Park: Possibly you have scale on the vines; send us a sample of the specks that are troubling you, and we will advise you what to do. You can obtain full information respecting the National Amateur Gardeners' Association from the hon. secretary, Mr. Fred. A. Poulton, Rosemount, Park Road, New Barnet.

TUBEROUS BEGONIAS FROM SEEDS.—W. C. G., Woking: Sow the seeds at once in a warm, moist house, such as a stove, propagating house, or pit, or, if only a warm greenhouse is available, place the seed pan in a handlight and cover with glass, selecting the warmest part of the house for it. Use very fine sandy soil, the sand itself being very fine; make the surface of the soil in pot or pan quite level and firm, and then gently lower the pot or pan into a bucket of tepid water, so that the water soaks up through the soil and moistens the surface. After the surplus water has been allowed to drain away sow the seeds carefully and thinly, cover with glass and cover the glass with a sheet of paper. In a moist atmosphere watering should not be needed until germination ensues, but if the surface seems dry dip the pot or pan, but do not water overhead or the seeds will be floated away or to the sides of the pot. Shade the seedlings from sun and very bright light, and prick them off into pans of light sandy soil quite early. Pricking off is a tedious but very necessary business at an early stage, because few things damp off more quickly than crowded begonia seedlings. It is a good plan to raise the soil in the pans just above the level of the rim for the seedlings removed from the seed pan. A tiny piece of wood smoothed to a chisel-like point, and with a V-shaped notch cut in this edge, makes a capital little tool for lifting the tiny seedlings from the seed pan. As the seedlings grow in their new quarters give them more light, and keep them near the glass. They will soon need more room and a richer compost. Shield them from bright sun until they have become established in 60-sized pots or in beds in frames.

AMARYLLIS.—S.W.P., Hinckley: As soon as the flowers have faded cut down the spikes and repot or top-dress the plant according to the condition of its roots and the soil they are in. Then place in a stove and afford plenty of atmospheric moisture. Amaryllis are robust feeders, consequently a rich soil is essential; firm potting should also be practised. We prefer to repot the bulbs before they commence to throw up their spikes, and they soon commence to root, and there is no need of disturbance after the spike is cut down. Cooler conditions and less moisture must be provided when the leaves have reached full size, and full sunshine to ripen up foliage and bulbs. Write us again later.

INSECT-INFESTED MYRTLE TREES.—M. E., Derby: Cut the trees back a little, so as to encourage new growth from the older wood, and thus provide better furnished specimens. Burn all the prunings at once. Lay each tree on its side, the pot being raised on a stool or box, so that the tree hangs over a tub, and while in this position thoroughly syringe the tree with hot soapy water; indeed you can scarcely do better, if you have a tank or tub big enough, than dip the whole of each tree (roots and soil excepted) in a bath of hot water, at a temperature of 150 deg., Fahr. Failing accommodation for such a dipping process, use hot soapy water, taking care to syringe every part of the stem and foliage. A skilful use of finger and thumb while the leaves are wet and soapy will remove or dislodge a great deal of the filth and insects, and another syringing should follow. If you have sufficient patience to do so, sponge every leaf with a hot soapy mixture after the preliminary syringing to soften the dirt and dislodge and kill insects. If you value the trees this work will be well repaid, and if it is taken in hand at once many syringings with insecticide will be saved, and the new growth will be allowed to grow clean and healthy. See that the trees do not suffer from lack of moisture at the roots, and place them in a warm greenhouse (not a hot stove) and syringe them once or twice a day during fine weather to induce new growth to start.

NAMES OF PLANTS.

J. M., Uttoxeter.—Ceropegia Woodi.

S. S., Hale.—1, Galanthus Elwesi; 2, Eranthis hyemalis.

L. E. E., Hull.—1, Dendrobium splendidissimum; 2, D. heterocarpum.

W. H. K., Tewkesbury.—Crotons and dracænas and caladiums stand pretty much in the same position among foliage plants as roses, sweet peas, and chrysanthemums do among florists' flowers, and it is practically impossible to identify them unless there is a collection at hand for purposes of comparison; 1 is C. Oerstedti; 2, probably C. interruptum; 3 and 4, not recognised; 5, closely resembles the old C. aucubifolium; and 6 is probably C. variegatum.

Messrs. Bayliss, Jones, and Bayliss, of Wolverhampton, recently experienced the loss of their large electric power station, the building and its valuable plant being completely destroyed. We are glad to learn, however, that the firm was able to arrange for a large and immediate supply of electric energy, so that there was practically no delay in the execution of orders, a matter upon which both the firm and its customers are to be congratulated.

THE SPRING NUMBER

. . OF . .

THE GARDENERS' MAGAZINE.

Will be Published Next Week. Price TWOPENCE, by post 2½d.

THE CONTENTS WILL INCLUDE:—

- The Making of a Large Rock Garden.
- Rockeries for Small Gardens.
- Alpine Pinks.
- Preparation of Vegetables for Exhibition.
- Summer Salads.
- Vegetable Marrows.
- Summer Crops of Tomatoes.
- Runner Beans.
- Annual Flowers for the Conservatory.
- Evergreen Dendrobiums.
- Zonal Pelargoniums.
- Seed Sowing on Clay Soils.
- Borders of Annuals.
- Columbines.

. . AND . .

MANY FINE ILLUSTRATIONS.

☞ **TO ADVERTISERS:** Our Spring Number is invariably the largest and most interesting and important issue of the whole year. It offers the best possible opportunity to advertisers, and as the best positions are always in great demand, it is important that space should be secured without delay.

We finally close for Press on TUESDAY, February 22.

Offices: 148 and 149, ALDERSGATE STREET, LONDON, E.C.

CATALOGUES RECEIVED.

JAMES MURRAY AND SONS, DEPTFORD.—A well-arranged, and finely illustrated and most interesting seed catalogue, with many references to the old florists' flowers of Parkinson's time. Seeds inoculated with nitrogen-fixing bacteria are a speciality.

R. WALLACE AND CO., COLCHESTER.—New and rare hardy plants are a feature of this useful catalogue; lilies occupy a large space and hardy florists' flowers are extensively listed. Every plant catalogued is described.

STORRIE AND STORRIE, GLENCARSE, PERTHSHIRE.—This is a catalogue of "Seeds and tiny seedlings," a great feature being the offer of seedlings of the firm's fine strains of various hardy flowers, notably auriculas and polyanthuses.

J. CHEAL AND SONS, CRAWLEY.—This catalogue of dahlias of all sections, chrysanthemums, carnations and bedding plants reminds us that "spring is coming."

SUTTON AND SONS, READING.—Under the title of "Farmers' Year Book" the Reading firm has issued a freely illustrated catalogue of farm seeds. Specialities in mangolds, swedes, kale, cabbage, and other food crops for cattle figure largely.

For full advertisement see page xiv.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

Everyone interested in their Garden or Greenhouse should send a card for our List of

ORCHIDS, LILIES, Etc.

100,000 just received from all parts of the Globe.

ALL EASILY GROWN SORTS.

A few days' delay may occur in the despatch of List, as the consignment is very large and will take some days to arrange.

POTATOES GIVEN AWAY.

21s. WORTH FOR 4s. 6d.

WITH 4lbs. of OUR NEW POTATO, The "Rising Sun," for nothing, Six Packets of Flower Seeds, large Packet of New Butterfly Sweet Pea.

1 quart First Early Pea, 1 quart Second Early Pea, 1 pint Maincrop, in all five pints of Peas; ½ pint "Sword" Broad Beans, ½ pint New Prize Taker Runner Beans, and 1 ounce of each of the following: Spring Onion, Parsnip, Carrot, Cress, Mustard, Beetroot, Turnip, Radish; also large packet of each of the following, each packet containing about **2,000** seeds. Broccoli, Brussels Sprouts, Savoy, Cabbage, Cauliflower, Lettuce, Celery, Parsley, Leek, Herbs; also packet of Cucumber, Marrow, Tomato, and 4lb. of our New Potato, "The Rising Sun," first time offered, Grand First Early Kidney, and 7 packets of Flower Seeds, as above. Now the whole of the above, all named, carefully packed, and free on rail, **4s. 6d.** Give rail address; they are too heavy by post. Book also, with full instructions.

2s. FOR THE VILLA OR COTTAGE GARDEN. 2s.

4lbs. THE RISING SUN POTATO, ½ pint First Early Pea, ½ pint Second Early Pea, ½ pint Maincrop Pea, ½ pint Kidney Beans, ½ pint Broad Beans, ½ ounce of each of the following:—Onion, Radish, Turnip, Carrot, Mustard, Cress, also packet each of the following: Parsley, Beetroot, Cauliflower, Broccoli, Brussels Sprouts, Lettuce, Marrow, Savoy, Cucumber, Celery, Cabbage; also 6 packets of Flower Seed, 1 packet of our New Butterfly Sweet Pea. Carefully packed and everything named, free on rail, **2s.** N.B.—No old seed sent out in any collections by us. All seeds are tested before leaving the warehouses.

1,300 Butterfly Fairy Sweet Pea, 1s.

YES, the **NEW BUTTERFLY SWEET PEA** gave grand satisfaction last year, and won prizes all over the country. We sold over one ton of Sweet Pea Seed. Order at once. Sow now for early bloom. **1,300** seeds, in all colours, **1s.** free; **600** seeds, **7** stamps, free.

2s. 9d. A TIP-TOP GREEN-HOUSE COLLECTION. 2s. 9d.

2 Palms, 4 Heliotrope, 10 Mixed Plants, 6 Fragaria, 2 Asparagus Plumosa, 2 Rhododendrons, 2 Pelargoniums, 1 Aralia, 1 Fern, 6 Smilax, 4 Pentstemons, 2 Dracænas, 3 Begonias, 4 Solanums, 2 Asparagus Ferns, 6 Primulas, 4 Carnations, 4 Cyclamens, 6 Salvias, 2 Deutzias, 4 Calceolarias, 2 splendid Pot Roses, 6 Hanging Plants, 2 Maidenhair Fern Trees, 4 Marguerites, 4 Lily of Valley, 4 Nicotiana, 4 Scarlet Musk, 10 Acroclineums, 2 Bridal Wreath, 6 Tomatoes gratis. All suitable for cool greenhouse, carefully packed, and all free on rail, **2/9**; half quantity, free on rail, **1/9.**

2/3. 12 FLOWERING SHRUBS. 2/3.

TO FLOWER SHORTLY, including Rhododendrons, Mock Orange, Ribes, Guelder Rose, Weigelas japonica, Tulip Tree, and others, in all 12 splendid shrubs, from 2 to 4ft. high, carefully packed, free on rail, **2s. 3d.**

POTATOES. POTATOES, POTATOES.

1 PECK OF FIRST EARLY, 1 peck Second Early, 2 pecks Maincrop—in all 4 pecks of Potatoes, packed in separate bags, named, free on rail, **3s. 9d.**; half quantity, 2 pecks, **2s.**, free on rail.

SPLENDID HERB COLLECTION.

3 Sage Trees, 3 Thyme, 10 Parsley Plants, 1 Lavender, 1 Rosemary, 1 Bay Tree, 6 Mint. The 25 plants, named, free on rail, **1s. 3d.**

JUST SUIT MY GARDEN.

ALL FRUIT-BEARING TREES.

2 BUSH EATING APPLES, 2 Cooking Apples, 2 Pears, 2 Plums, 1 Cherry, 1 Apricot, 1 pint of our New Pea I Come First, 1 pint of Second Early Pea Early Morn, 2lb. of our New Potato Rising Sun. Now all the above, Trees, Peas, and Potatoes, all named, and well packed, free on rail, **4s.** Half quantity, free on rail **2s. 3d.**

6 GRAND STANDARD ROSES, 5/6.

I have a grand lot of Standard Roses, **1s.** each, or 6 for **5s. 6d.** Also lovely Standard Tea and H.P. Roses, such as M. Niel, Gloire, La France, Frau Karl Druschki, Baby Rambler, Bessie Brown, Dean Hole, Teck, Ben Cant, Tom Wood, Paul, C. Forestier, and thousands of others, all grand heads, **1s. 3d.** each, or 6 for 7s.

1s. ea. CLIMBING ROSES. 1s. ea.

These are extra selected and fine large plants; could not sell them at this price, but I have an enormous stock. 6 for **5s.** Marechal Niel, Niphetos, W. A. Richardson, Gloire de Dijon, Crimson Rambler, Yellow Rambler, White Rambler, Pink Rambler, Dorothy Perkins, Lady Gay, and Baby Rambler. The above are a very special lot, being extra large and strong, 12 for **10s.**, free.

13 GRAND ROSE TREES, 3s. 6d.

WE WANT 50,000 People to see our New Seed and Rose Catalogue, and for a few weeks we shall send one of the finest collections of Roses in the kingdom, to comprise Liberty, Reynolds Hole, Clio, C. Testout, D. of Teck, C. Jacqueminot, J. Laing, La France, etc. Given gratis, one new white F. K. Druschki, or the new Richmond Rose; the whole 13 lovely roses, well packed, and free on rail, for **3s. 6d.**

5s. 12 CLIMBING ROSES. 5s.

Such as Marechal Niel, W. A. Richardson, Niphetos, Gloire de Dijon, Pink Rambler, L'Ideal, Carmine Pillar, new Red Gloire, and others; in all 12 splendid Climbing Roses, from 3 to 6 feet high, all named, carefully packed, carriage paid, **6s.** Half quantity, carriage paid, **3s. 6d.** (My selection.) Just one special line in Gloire de Dijon Roses, 6 to 7 feet high, enormous trees. Grand for walls or greenhouse, **2s.** each; worth 5s. Only a few.

50,000 GRAND BUSH ROSES, 4/6 doz.

We have a most splendid lot of Bush H.P. Roses, any names and colour you like. Your choice, **6d.** each; **4s. 6d.** doz.

40,000 GRAND DWARF TEA ROSES, 5s. doz.

We have a most lovely stock of the above Tea Roses, in all the leading names and colours, **6d.** each; **5s.** doz.

GREAT SALE OF FRUIT TREES.

5,000 splendid STANDARD APPLE TREES, all named, Eating or Cooking, 6 for **7s.**, 3 for **3s. 6d.**, or **1s. 3d.** each.

5,000 lovely PEARS and PLUMS, grand fruit-bearing trees, 6 for **7s.**, 3 for **3s. 6d.**, or **1s. 3d.** each.

5,000 Three-quarter Standard APPLES, fine heads, Eating or Cooking, not quite so tall as the above, but equally as good, 6 for **5s. 9d.**, 3 for **3s.**, or **1s. 2d.** each.

3,000 Half-Standard APPLES, fine bushy heads. These are preferred by many to any of the above, especially for gardens, as they do not catch the wind so much. Eating or Cooking, named, 6 for **5s.**, 3 for **2s. 9d.**, or **1s.** each.

2,000 Half-Standard PLUM, GREENGAGE, DAMSON, PEARS, and CHERRIES, 6 for **5s.**, 3 for **2s. 9d.**, or **1s.** each.

Any of the above can be assorted in Apple, Pear, Plum, or Cherry—as you like.

3,000 BUSH or PYRAMID APPLE, PEAR, PLUM, or CHERRY, all grand stuff (see Catalogue for names), all splendid fruit-bearing trees, **1s.** each, or 6 for **5s.**

2,500 BUSH or PYRAMID APPLE, PEAR, PLUM, or CHERRY, all grand stuff, but not quite so large as the above, **9d.** each, or 6 for **4s. 3d.**, named.

6,000 TREES (Names Lost).—Now, I had the misfortune to label a quantity of trees with labels that were sold as waterproof, but were not, so when we went to label them properly the names had washed off. Now we must clear these at once. They are all strong fruit-bearing trees, in fact, many had fruit on last season. The eating Apples are distinct from cooking Apples, so can give you which you like. Now, to clear the whole field, I make this terrible offer in Apple, Pear, Plum, Damson, Greengage, Cherry, all same price, or mix them as you like, **9d.** each, 6 for **4s.**, 12 for **7s. 6d.** Mind, these are a great bargain, and will soon go.

10,000 APPLE, PEAR, PLUM, CHERRY.—When you like, how you like, what you like. These are smaller ones picked out from the above lot; are nice stuff; **6d.** each, 6 for **2s. 9d.**, 12 for **5s.**

HAVE FLOWERS ALL SUMMER.

2/6 A LOVELY PERENNIAL COLLECTION. 2/6.

20 SPLENDID WALLFLOWERS, 6 Carnations, 10 C. Bells, 10 Calliopsis, 10 Chrysanthemums, 10 Yellow Erysimum, 6 Grand Lupins, 11 Lovely Pinks, Sweet Williams, 12 Lovely Poppies, 6 Honesty, Pæony, 10 Galegia, 10 Rockets, 2 Fancy Shrubs. Now all the above, carefully packed, 120 plants, etc., and Free on Rail, **2s. 6d.**

Cash with all Orders. All Packing and Packing Material Free, and all Goods Free on Rail.

NOTES OF THE WEEK.

Soils and Plant Growth.

The rapid germination of seeds, as well as the development of plants to maturity, is essentially dependent upon the maintenance of the appropriate temperature of the soil. The temperature most favourable to germination or growth, as well as the degree of tolerance of high and low temperatures, varies greatly with different plants, governing mainly what is known as their climatic adaptation. A knowledge of these points with reference to the various plants is therefore of no mean importance to the gardener, for, to a certain extent, he can control the temperature in the soil itself, and he can mostly choose for sowing and planting the time when the soil shall have the proper temperature for rapid germination or maturity. As a rule, it is not desirable to have either seeds or seedling plants in the ground for any length of time when the temperature is too low for active vegetation; for while they rest, other lower organisms (fungi and bacteria) adapted to low temperatures, may continue in full activity at the expense of the vitality of the crop plant. It is not surprising, then, that the occurrence of cold or warm rains, or the use of cold or warm syringings at critical periods, may largely determine the success or failure of the crop. It is well known that the occurrence of a cold rain after vegetation has started actively in early spring may not only destroy the season's fruit crop by preventing the setting, or thereafter causing the dropping of the fruit, but may even, if the suppression of vegetative action be continued for some length of time, result in serious injury to the trees. Among those conditions that influence soil temperature colour may be mentioned. While it is true that, broadly speaking, dark-coloured soils absorb more of the sun's heat than light-coloured ones, other things being equal, it must still be understood that the nature of the colour-giving substance exerts a very material influence upon the amount of heat absorbed. Thus charcoal is among all known substances the one absorbing and radiating the sun's heat rays most powerfully. But other substances, which to the eye appear equally black, have by no means the same absorbing power. The heat absorption by black humus matter is high, though not equal to that of charcoal, and many grey soils, though appearing to the eye of rather light tint, really absorb more heat than others which, to our perception, have the darker tint, but are coloured by other substances. Gardeners, and especially vine growers, in the colder portions of Europe, often take advantage of the powerful absorbing power of carbon by spreading charcoal or black slate powder over the surface of the soil where early maturity is specially desired; and slate powder is similarly used by the peasants at Chamounix to hasten the melting of the snow. While it is true that plants cannot form their substance or develop healthy growth in the absence or scarcity of the chemical ingredients, it is also true that they cannot use these unless the physical conditions of normal growth are first fulfilled. Both sets of conditions are equally important and exacting as to their fulfilment, and the gardener's task is to bring about this concurrence to the utmost extent possible. The chemical ingredients of plant food can, however, be artificially supplied in the form of fertilisers, should they be deficient in the soil. But, however important is the natural richness of the soil in plant food, the first care should always be given to the proper physical conditions in the soil, subsoil, and substrata. Without these, oftentimes, no amount of cultivation or manuring is effective in assuring profitable cultural results. But even the abundant presence of the plant food ingredients, as shown by analysis, will not avail unless at least an adequate portion of the same exists in a form accessible to plants. Finally, there is practically in all soils a certain proportion of the soil minerals in their original form as they existed in the rock materials from which the soil was formed. These materials being usually in a more or less finely divided or pulverulent condition, they are attacked much more rapidly by the chemically acting and weathering agencies, viz., water, oxygen, carbonic and humus acids, than when in solid masses, and thus transformation of the inert rock powder into the other two classes of mineral soil ingredients progresses in naturally fertile soils with sufficient rapidity to produce, in a single season, sensible and practically important results known as the effects of fallowing.

MR. R. G. THWAITES.

Mr. R. G. Thwaites, whose portrait we have the pleasure of giving in this issue, has for some years devoted a considerable share of his leisure to orchids, and has raised so large a number of beautiful hybrids as to have obtained a foremost position among amateurs who give attention to this fascinating family of plants. Mr. Thwaites commenced growing orchids in 1892, and his collection has extended so rapidly that in his gardens at Streatham he has nine houses devoted to them. This rapid growth of the collection would be interesting under ordinary circumstances, but it becomes especially so when it is remembered that many thousands of them are home-raised. Originally the collection was general, but Mr. Thwaites soon became interested in dendrobiums and albinos of all kinds. The first of the seedlings raised in the gardens of Chessington, Mr. Thwaites' residence, were D. Wiganianum and D. Thwaitesæ. Among the many others that have subsequently been raised are D. nobile virginale (true from seed), D. Blackmanii, D. Austinii, D. Chessingtonense (considered to be one of the finest dendrobiums yet raised), D. atro-Brymerianum, and D. fimbriatum occulatum x D. Thwaitesæ (not yet flowered). Mr. Thwaites is now chiefly interested in albinos of all kinds and species and hybrids amongst odontoglossums, cattleyas, sophronites, and odontiodas. Of the very large numbers of these raised at Chessington it may be mentioned that they include many blotched Odontoglossum crispum, raised true, and one in record time; O. Thwaitesæ, O. Ernestii, O. tigrinum, and many O. Edwardii. In cattleyas great efforts have been made to obtain albinos, and the successes include C. Dusseldorfii, C. Maggie Raphael alba, C. Mossiæ Wagenerii. Amongst a large number of coloured hybrids, C. Iris, C. Adula, C. Roupelleana, and all the important "Digbyana" crosses. With the sophro-cattleyas the successes have been great, and the more noteworthy hybrids are: S. c. Thwaitesii, S. c. Blackii, S. c. Warnhamensis, S.c. Ortonii, S. c. Saxa, and S. c. Wellesleyii. The odontiodas that have been raised include O. Thwaitesii, O. Cooksoniæ, O. Charlesworthii, and O. St. Fuscien. Mrs. Thwaites and Mr. Black (the grower) are equally interested with Mr. Thwaites in colour predominance and albinism, and the bulk of the experiments at Chessington have this end in view.

Plant Breeding at Cambridge.—We learn that a sum of £50 has been granted from the Gordon Wigan Funds to Mr. A. G. Tansley, to enable the Cambridge Botanic Garden Syndicate to continue to afford facilities for experiments in plant breeding.

New Chinese Trees and Shrubs.—Of hardy trees and shrubs the most important contributions to the Royal Gardens during 1909 have, according to the "Kew Bulletin," been made by Professor Sargent, of the Arnold Aboretum. In continuation of the consignments of Chinese seeds collected by Mr. Wilson, so liberally sent in 1908, some 400 further packets were received in 1909, most of them unnamed and under number only. Amongst them were 60 packets of rhododendron seeds, all of which, with the exception of four or five packets, have germinated well. Professor Sargent also sent numerous living plants, especially twenty-five lots of new Chinese oaks. Among other things of more than usual interest are Pterocarya Rehderi (a new hybrid), Betula Kenaica, Æsculus Bushi, and Æ. chinensis. This is perhaps the first introduction to Great Britain of this fine Chinese horse chestnut, for, although many plants under the name have been grown in Europe during the last thirty years, none have been true.

Flower Pictures at Westminster.—Prominent among the many objects of interest at the exhibition in the Horticultural Hall on Tuesday was a collection of nearly fifty water-colour drawings of flowers and garden scenes, by Miss Josephine Gundry. These drawings were of special interest from the fact that this clever artist possesses in a marked degree the faculty of combining fidelity to Nature with artistic expression. "Barkfield House, Billingsworth," was remarkable for the successful treatment of the mansion, the great masses of flowers that filled the beds and borders, and the wide-spreading lawns, the grass being especially noteworthy for truth of colouring. The two or three other drawings made in the gardens of Barkfield House, are not less noteworthy for their excellence. The six drawings of the gardens and woodlands at Eilanreach, Glenelg, are remarkably beautiful, and show that Miss Gundry is equally at home in the treatment of garden and natural scenery. Especially interesting also are the drawings depicting scenes in Mr. C. E. Shea's gardens, at Foot's Cray, for they show how varied is the taste of Mr. and Mrs. Shea, and the judgment evinced in the creation of the several features, and also the skill of the artist.

Plant Adaptation to Soils.—The first of the two Masters' lectures by Mr. A. D. Hall, M.A., was given at the afternoon meeting of the Royal Horticultural Society on Tuesday before a large audience. The subject of these lectures is the "Adaptation of Plants to Soils," and the general aspect of the questions involved was discussed by Mr. Hall with the lucidity and force which have brought him fame as an exponent of scientific matters; but the conclusions at which he arrived with regard to the cause of plants thriving on some soils while failing in others are so far at variance with the generally accepted views as to require careful consideration.

The Royal Caledonian Horticultural Society will hold two exhibitions during the current year, and the first of these will be held on April 13 and 14, and the second on September 7 and 8. In the schedule of the April show there are 142 classes, in which provision is made for practically all the kinds of plants, flowers, fruits, and vegetables that can be successfully exhibited during the spring season. The September schedule contains 234 classes, and in subjecting them to an examination it occurs to us that the number might with advantage be reduced by the elimination of some of the smaller ones. The most important of the competitions for fruit at the September exhibitions will be those for a table of dessert fruit, decorated with plants, cut flowers, or foliage; collections of twelve dishes of fruit; and eight bunches of grapes, the premier award for the latter being a fifty guinea challenge trophy presented by Mr. W. H. Massie, and £6 in cash.

Pleasure Ground for Harwich.—The Cliff House Spa and grounds, Harwich, have been secured on lease by the Harwich Town Council for the purpose of a public recreation ground. The site is a delightful one, at considerable height, and overlooking the bay. The toll hitherto taken for passing through the Spa grounds will be now abolished. We understand the lease is for thirty years, at £100 per year.

"**Kew Bulletin.**"—The first issue of this publication for the current year is of much interest. The principal contents include a paper on the more recent of the exotic species of fungi that have been received at Kew; notes on the woodlands at Rotherham, Raby Castle, Haydon Bridge, Alnwick Castle, Chatsworth and Wortley Hall; and a report on the growth of Ulva latissima in water polluted by sewage.

Epping Forest.—In its annual report to the Corporation the Epping Forest Committee states that the necessary thinning of portions of the forest was continued, but the work was lighter than in the previous year. A further enlargement of the lake on the north-east portion of Wanstead Flats, and of the Hollow Pond has been carried out, and the new Heronry Pond has been cleaned out. These various works had given employment to between 500 and 600 men weekly. The committee attempted without success to procure the exemption of the forest from the road and afforestation clauses of the Development and Road Improvement Funds Bill, fearing that the preservation of the forest from road making was insufficiently safeguarded. But any order for the acquisition of any common, open space, or allotment cannot under the Act have effect until it is confirmed by Parliament. During the year 58 cricket pitches, 131 football grounds, and six hockey grounds had been in use, in addition to those at Wanstead Flats and Chingford. There were, also, three golf courses, and various arrangements for lawn tennis, quoits, bowls, and hurling. In all, about 5,000 players were thus provided for. The total expenditure by the Corporation on the forest was £6,514, and the income £3,217, the balance (£3,296) being met from the City's cash.

Whitton Park, which has for a long period enjoyed considerable fame for its fine cedars and other trees, came into the market some time ago, and it was hoped the park would be secured as an open space for the people of Twickenham, Heston, and Isleworth. This hope has, we regret to learn, failed in its realisation. A provisional agreement had been entered into between the District Councils and the vendors, by which the land would pass into the possession of the former for the sum of £3,000. A difficulty appears to have arisen with regard to the amount that should be allowed as compensation for rights of way over the estate, and, as a consequence of the failure to surmount it, the owners have informed the Councils that they are now considering a better offer.

Gardening Apprenticeships.—The subject of apprenticeship as the first step in the education of a gardener is one that has been discussed many times. Everything depends upon the person to whom a lad is apprenticed. In the old days, and in some gardens, apprentices were a distinct source of profit to the head gardener, and if he were unscrupulous he took as many premiums as possible, and left the apprentices to take care of themselves. In other cases it was far different. The subject is again brought forward in the current issue of the "Journal" of the British Gardeners' Association, wherein Mr. Alex. Dean, V.M.H., invites opinions as to the best means of starting lads in the horticultural profession. He writes: "Few subjects could have for the future gardeners and gardening greater interest. But whilst there may be the strongest possible objection to the recurrence to what was at the best a bad method of training gardeners, there is the fact to be faced that we have to find outlets in gardening as another vocation for our boys, and the point which merits attention is, under what conditions should that necessity be met."

The Malcolm Dunn Memorial.—The trustees of the Malcolm Dunn Memorial in Horticulture, which was founded in 1902, annually offer a medal and prize for specified products through one of the Scottish horticultural societies. This year the medal and prize will be offered through the Royal Horticultural Society of Aberdeen for a collection of ten kinds of vegetables.

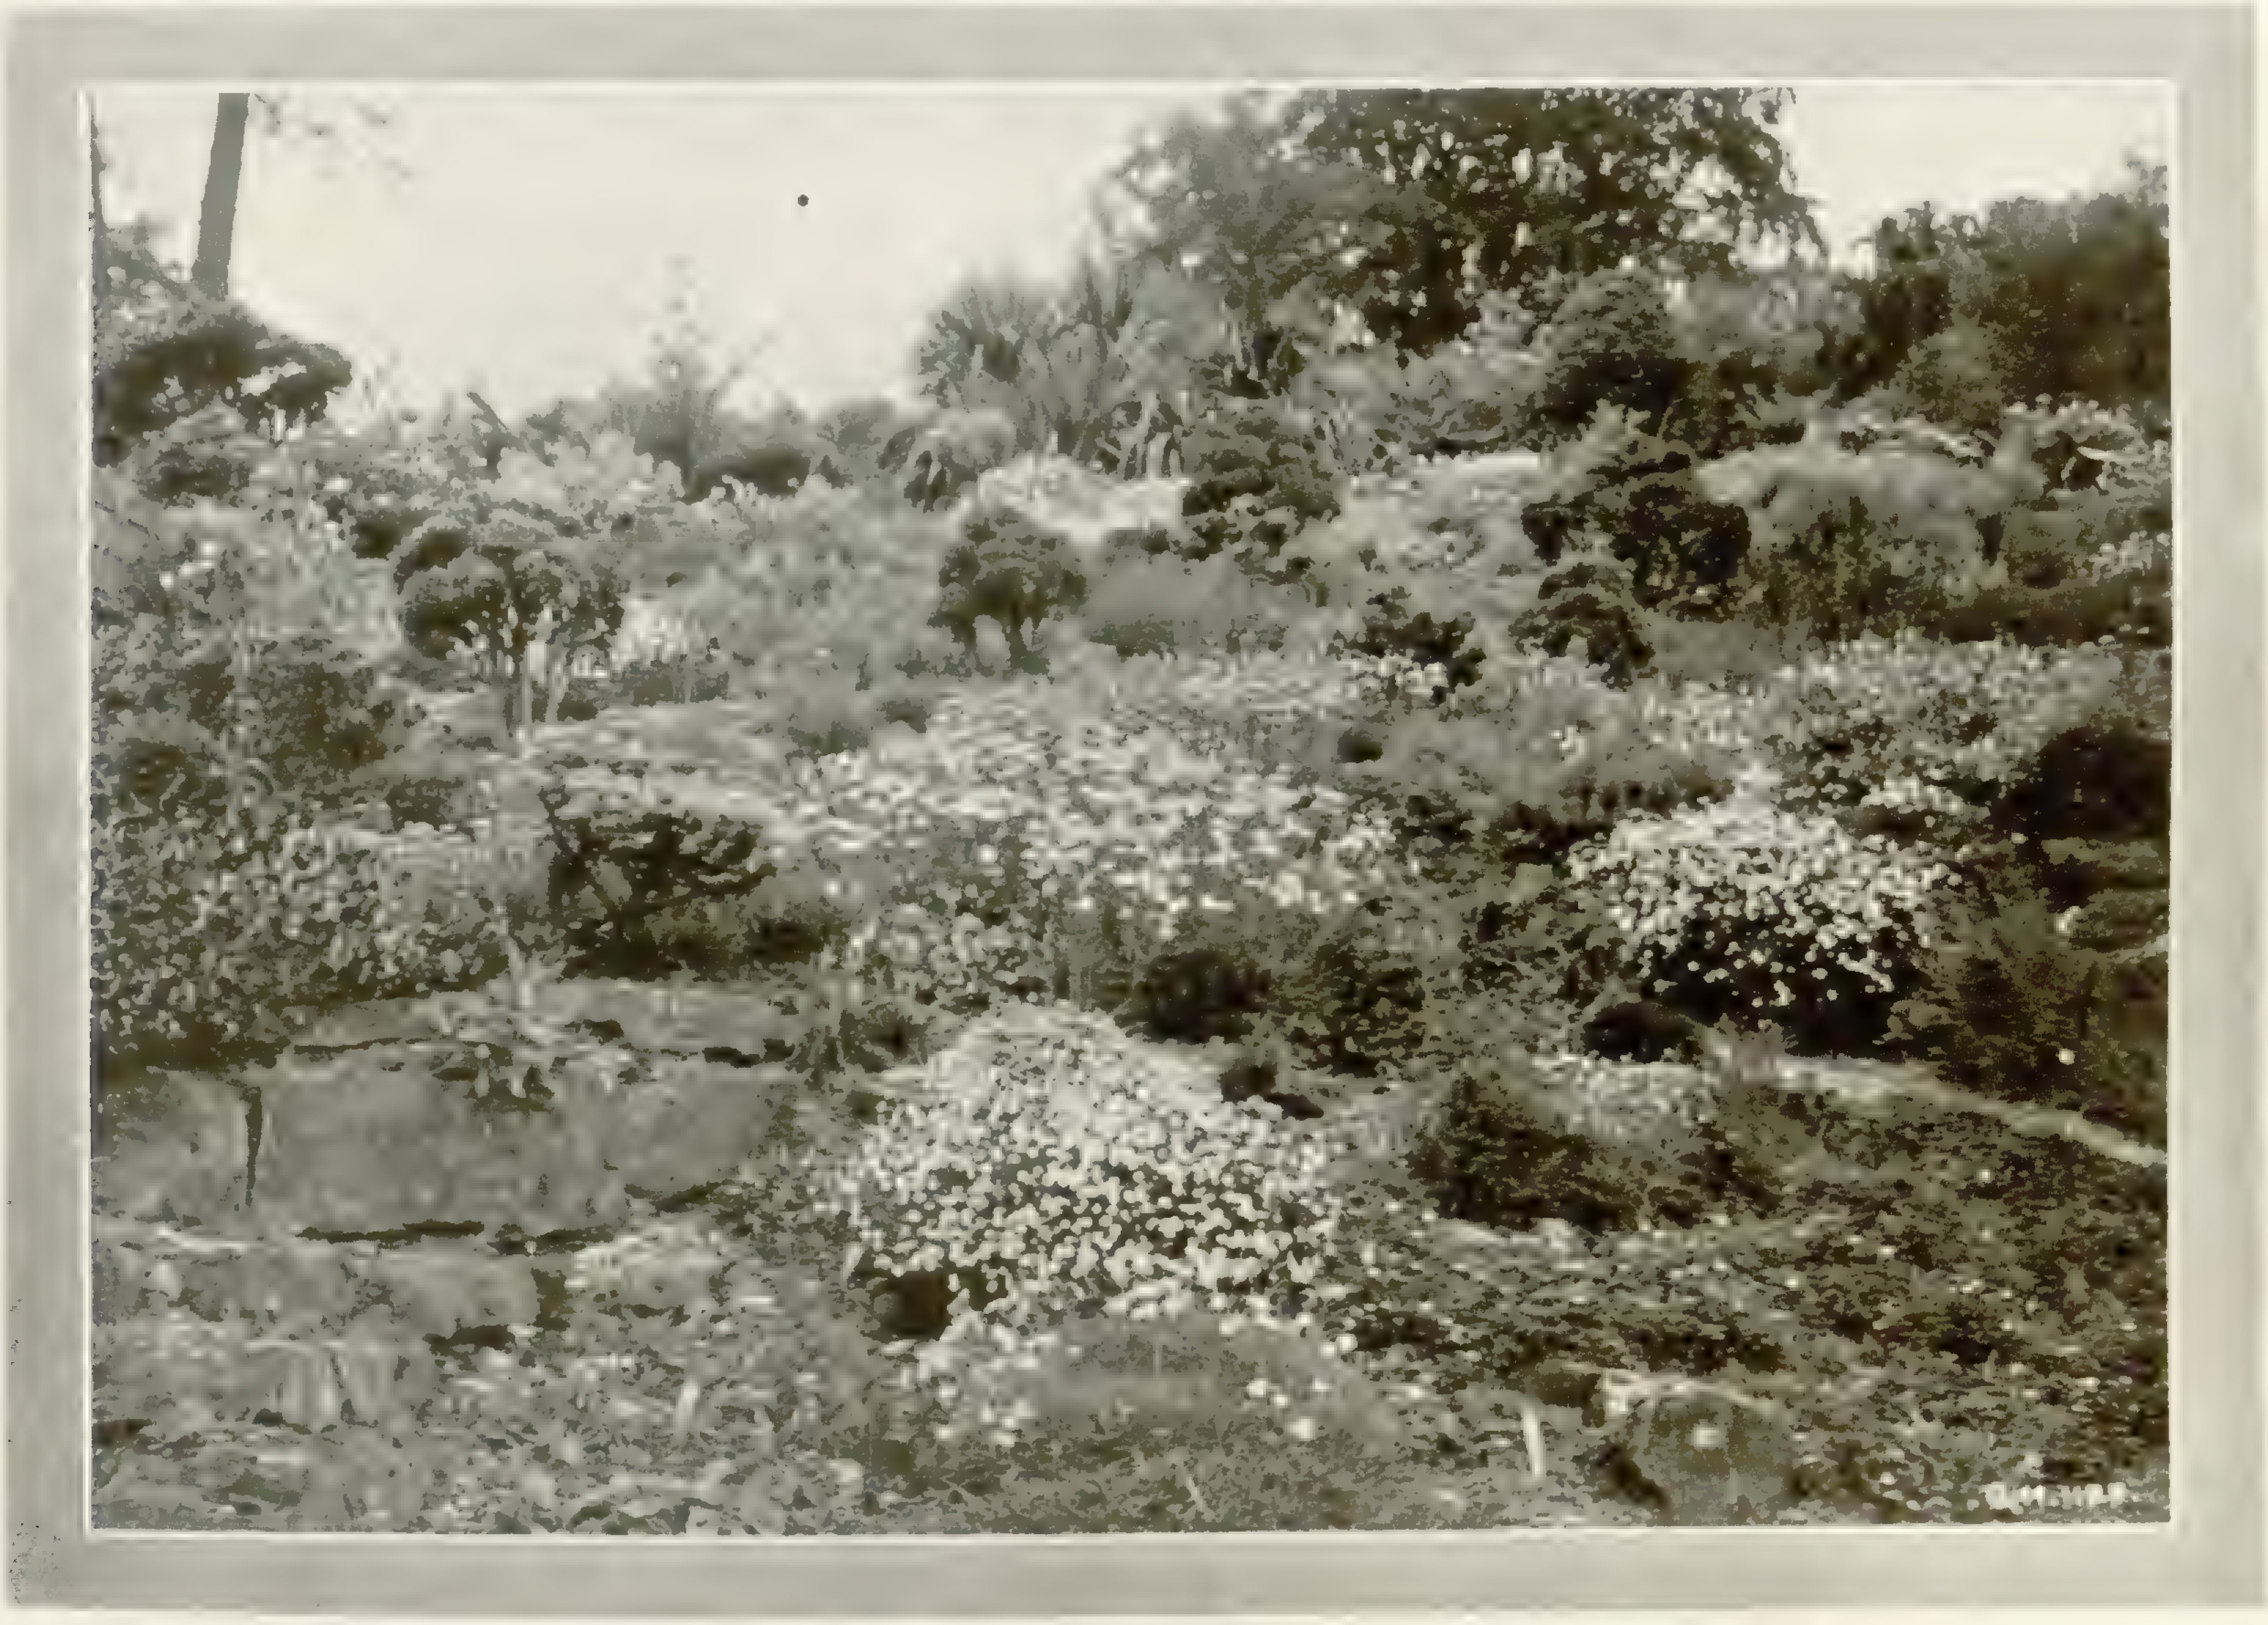
Kew Herbarium.—During 1909 about 22,000 specimens were added to the Herbarium of the Royal Gardens. Of these nearly 14,000 specimens were received as donations or exchanges, while over 8,000 were purchased. The most important of the collections received during the past year was the herbarium of the late Dr. Savatier, which was purchased from his daughter Mme. L. Raoulx.

Ground Nuts in the West Indies.—An effort to introduce new kinds of ground nuts from the United States into the West Indies has so far proved a failure, owing to a virulent attack on various parts of the plants by different species of [illegible]. The latter seemed to find something very much to their liking in the new nuts, and at present the advantage is with them, as ordinary means of prevention and cure have proved unavailing.

ALPINE PINKS.

The species of Dianthus that are found growing naturally in alpine regions, or that thrive on the rocky slopes at lower altitudes, form so large a group that those cultivators who may be disposed to take the steps necessary to have them represented in their rock gardens will have a considerable range for selection. A large collection is by no means essential to the full enjoyment of the distinctive charms of this section of the family of pinks, and the cultivator will be well advised in limiting his selection to a comparatively small number that are distinct and beautiful, and can be successfully cultivated without any special difficulties having to be contended with. It might be said, and with some truth, that the cultivator who shirks difficulties will not attain to the highest eminence; but there is a great difference between contending with difficulties that are unavoidable and selecting plants that can only be satisfactorily grown with special care and unremitting attention, when others of the same kind, and equally beautiful, can be grown to a high degree of perfection with ordinary care. The cultivator who is anxious to have everything in his garden in as good a condition as possible will not need to have any considerable number of subjects that require exceptional attention to ensure his time being fully occupied. In selecting a few of the most beautiful from the large number of species available this point will be kept in mind.

In adding a selection of pinks to the rock garden full consideration should, as a matter of course, be given to the space available for them. For a rockery of small or medium size a few clumps will suffice; but in rock gardens of considerable area a slope having a suitable aspect might, with advantage, be wholly or in great part devoted to them. This has been done with much success in the rock garden which forms so important and delightful a feature of the extensive gardens at Leonardslee, Sir Edmund Loder's fine Sussex seat. The accompanying reproduction of a photograph of the slope, that was taken when the pinks were in full bloom, will convey an excellent idea of the great charm of the large masses of flowers. The illustration is of interest also as showing the arrangement of rock and soil by which the greater proportion of the many beautiful species can be the most successfully cultivated. We know that the wild form of the carnation will grow freely on old walls, and that in their native habitats specimens of considerable size may be seen hanging over ledges, where it appears difficult for the roots to effect a lodgment. We sometimes have evidence of an endeavour to establish the alpine species on old walls, but we cannot call to mind one that could be regarded as really satisfactory. The proper course to take in establishing these pinks is to plant them where the ledges are of sufficient breadth for the roots to have a rather liberal quantity of soil about them, and where, also, they are not likely to unduly suffer from drought. Turfy loam, to which liberal proportions of coarse sand and calcareous matter have been added, forms the most suitable medium for the roots of alpine pinks, with the exception of the Glacier Pink (Dianthus glacialis) and one or two others that have their homes on granite rocks, and for these granite chips should be used. Lime rubble from an old building is the best form of calcareous matter for incorporating with the soil in which these pinks are to be grown.



ALPINE PINKS IN THE ROCK GARDEN, LEONARDSLEE.

Dianthus alpinus is, perhaps, the best known of the species in cultivation in this country, and certainly one of the best. It grows to a height of six or nine inches, has a good constitution, is compact in growth, and produces a profusion of flowers, which are bright rose marked with crimson in the centre. The white variety of the alpine pink is also most desirable.

D. callizonus is a species quite distinct in character, and of great beauty. The growth is dense, and attains a height of five or six inches, and the comparatively large flowers are rose-pink with a purple zone. This species attains to the highest state of development when occupying a position where it will receive some shade from jutting rock or neighbouring plant.

D. cæsius, commonly known as the Cheddar Pink, is one of the most desirable of the species suitable for culture on the rockery. It is so neat in growth as to form dense cushions of glaucous green leaves, and it has the advantage of being one of the easiest to establish and cultivate. The flowers are rich rose-pink, and pleasantly fragrant. Arvernensis and Le Bouboule are two excellent varieties that are rather later in flowering than the type.

D. deltoidea, popularly known as the Maiden Pink, is a native of this country, and one of the most beautiful of our wildings. Less compact than the majority of the species, it is free in blooming, and the bright pink flowers are highly attractive. It has green leaves, is most vigorous in growth, and will thrive under widely divergent conditions. Pulchellus is a charming variety that should receive attention.

D. Freyni is one of the most recent of the pinks suitable for the rock garden that has been introduced to this country. The growth is dwarf and compact, and the flowers are freely produced, and of a rose-purple hue.

D. glacialis is a distinct and decidedly pretty species, which has its home on granite formations, and must be grown where it will not come within the influence of lime. In preparing the stations peat should be substituted for loam, and granite chippings for lime rubble.

D. Knappi has the defect of a loose

habit, but it is free in blooming, and the flowers are bright cinnabar-red, passing to yellow. Under favourable conditions the growth attains a height of twelve inches, and the flowers have a pleasing effect when depending gracefully over the ledges.

D. monspessulanus is so distinct and attractive as to have strong claims for inclusion in a small selection. The average height is nine inches, the growth is compact, and the bright pink flowers are of large size, elegantly fringed, and highly fragrant. The white variety, albus, is also most desirable.

D. neglectus is one of the most beautiful of all the alpine pinks, and should be included in the smallest selection. The growth reaches a height of about six inches, the flowers are produced with great freedom, and are of a bright rose colour.

D. plumarius merits attention, for, with a vigorous and compact habit is combined abundant flower production. The flowers are comparatively large, elegantly fringed, pleasantly scented, and pink in colour, and large masses produce a pleasing effect. It will thrive in any position on the rockery, provided it enjoys full exposure to the sun's rays. G. G.

RUNNER BEANS.

Runner beans unquestionably rank among our most popular and useful of summer vegetables, and are cultivated equally well, and as easily, by the cottager and amateur as by the professional gardener. These were introduced about the year 1603, and have long been grown in all parts of the country, but it is during the last generation that the great improvements in varieties has been made, and though the initial cost of procuring the best sorts is a little high, the extra outlay results in superior appearance and quality.

Runner beans are most tender subjects, the least frost injuring them, especially when in a young state, consequently by far the best plan is to raise plants under glass either by placing them singly in small pots or sowing them in suitable boxes and thoroughly hardening them off before planting. This should be done at the end of April or the beginning of May. Endeavour to promote a stout, sturdy growth by keeping them close to the glass, and admitting abundance of air whenever the weather is favourable. Though this may appear to give additional work, it is really not so, as not only are the plants rendered safe from frost, but secure against the ravages of slugs, which frequently do irreparable damage, while the slight check caused by transplanting makes them commence to bear at a much earlier date than when sown in the open ground.

Preparation of the Ground.

This is of the utmost importance, and any pains taken to render the soil suitable will be repaid. A small quantity well managed will yield far more produce than two or three times the quantity treated in a slipshod manner. Unquestionably the best plan is to prepare trenches much in the same way as one would for celery, bearing in mind that this is a deep-rooting subject, and the roots will penetrate to a great depth if something tempting is placed below for them. This work should be carried out during the winter or early spring months, so that the frost and winds may have a purifying and beneficial effect on the soil.

The trenches should be taken out two feet wide and at least two feet in depth, and the bottom, whatever it may be, should be thoroughly broken up with a fork. Well-decayed farmyard manure should be placed therein, to the depth of about eighteen inches, and left in this condition until about a week before the planting is carried out. This should then be made thoroughly firm, and the best soil available should be placed on the top, about four to five inches in depth. Ample room should be allowed between the trenches, from ten to fifteen feet being none too much.

Planting.

Two lines of plants should be put in each trench, and from a foot to fifteen inches apart. Plant very firmly, give a thorough watering in, and place some finely sifted cinder ashes round each plant as a preventive against the attacks of slugs. A later sowing, if necessary, may be made between May 20 and 30 in the same way, except that the seeds should be sown more thickly, and the seedlings thinned out to the proper distance when the young plants are fairly established.

Staking.

A common mistake, too frequently made, is that of not providing runner beans with a sufficient length of support. Long brush sticks, the same as generally used for supporting peas, are often used, the result generally being that the tops double over, which means that sun and light is excluded, and the bearing is much impaired. Allow a height of from ten to fifteen feet, if possible; the stakes should be well inserted into the ground, and stout poles at regular intervals be driven in to help steady them against winds and gales. Stout tar cord should also be stretched along from pole to pole. The plants should be damped over each afternoon till they become well established, should the weather be dry.

Mulching.

Immediately the beans commence to crop a good surface dressing of thoroughly decayed manure, and a small quantity of bonemeal mixed with the same should be placed between the plants, while between the rows a good dressing of long stable litter should be given. Immediately the beans reach the top of the sticks they should be stopped to induce lateral growths.

Watering.

Abundance of water should be given during the cropping season in dry weather, both clear and in a liquid manure form. The drainings from a farmyard, with soot added, and properly diluted, will be found to suit them admirably, and during wet seasons apply patent vegetable manures in the quantities recommended by the vendors.

One frequently hears complaints of the flowers dropping off and failing to set. This is especially noticeable during hot dry weather. To overcome this trouble the rows should be thoroughly syringed or damped over in some way with tepid water during the early evening. Except when required for seeding purposes the pods should be regularly gathered immediately they are ready, and here let me state that when any particular plant shows an improvement over the rest this should most certainly be marked and saved for seeding purposes, as there is no doubt by careful selection the best results are obtained.

Varieties.

As before mentioned, there are now many varieties far superior in every way to the older kinds, yet, strange to say, one frequently sees nothing but the old Scarlet variety cultivated. Among the scarlet-flowered varieties by far the best both for exhibition and general use is Scarlet Emperor, raised by the late Mr. Richard Lye, of Newbury, who, perhaps, was more successful in exhibiting this vegetable that anyone else. Prizewinner is a distinct and refined variety, possessing much merit, and so also is Hackwood Success, raised by that famous vegetable cultivator, Mr. J. Bowerman, of Hackwood Park.

There are also several splendid white-flowered varieties, and when grown side by side with the scarlet sorts they produce a very pleasing effect. Jubilee produces very long pods of good quality, but perhaps is a little shy, compared with many others. I have been fortunate enough to raise a new variety, which I have named White Emperor, which, in my opinion, will become a standard variety. In the big trials carried out by the R.H.S. at Wisley during the past year this was, I believe, the only variety which obtained the high distinction of an Award of Merit. This will probably be sent out next season.

There are several excellent climbing French beans, now highly esteemed by many: one of the very best that has come under my notice is Princess of Wales. Some of the ornamental flowering and coloured podded varieties are worthy of cultivation from an ornamental point of view, Sutton's Ornamental Flowering Runner being a particularly attractive variety, the vines being purple, the flowers purple and white, and the pods a deep purple. Sutton's Ornamental Podded Runner is also extremely attractive, the pods being a creamy colour with scarlet splashings.

E. Beckett.

Aldenham House Gardens.

THE ROSE-BUD CHERRY.

Prunus pendula is an exceedingly pretty tree when well flowered during early spring, for the branches are pendulous and the blossoms appear in profusion. It is a Japanese tree, and, though kept up as a species, it is extremely close to P. sub-hirtella from the same country, the principal difference being in habit, the flowers and leaves of the two trees bearing a great similarity. It, however, comes true from seeds; but whether this will hold good in every case it is not possible to say. But, species or variety, it is a useful subject, and worthy of extended cultivation.

Maximowicz describes it as being found wild in mountain forests of Central Nippon and as being cultivated in gardens and near temples. A figure of it was published as long ago as 1759 in a Japanese publication, and it is there called "Ito Sakura," which is said to allude to its long slender branches, Ito meaning thread and Sakura a cherry tree. It was introduced into Europe in 1863 by Siebold, under the name of Cerasus pendula rosea, and it is sometimes still met with under that name.

The flowers are most ornamental when in bud and partly expanded, the colour at that time being a deeper rose than when the blossoms are fully open. Though seedlings asume the pendulous habit of the type, it is more frequently increased by grafting on to ordinary cherry stocks, the branches in this case being more regular than in the case of free-growing seedlings. It should be given a place sheltered from cold winds as the petals are delicate in texture and growth commences rather early. W. D.

Brussels Sprouts.—It is now a general rule to make a sowing under glass to provide early "buttons" in the autumn. Sow in boxes and raise the plants in a temperature of 50 degrees. Sutton's Dwarf Gem is excellent for this sowing. Michaelmas White Broccoli should be treated in the same way.—G. E.

BORDERS OF ANNUALS.

By a liberal use of annuals, or plants which yield readily to treatment as such, we may have beautiful showy beds or borders at an absurdly small cost, because the plants can be raised from seed, the hardy annuals out of doors in April, the others under glass in February or March, and planted out in May after being hardened.

There are many summer and autumn-blooming plants which, in beauty and duration, are as valuable as many perennials; take, for instance, stocks. The intermediate varieties—white, purple, and scarlet, 1 to 1½ft. high. Some of these are most gorgeous plants for borders, beds, and lines, and being so easily managed, they cannot be too strongly recommended. All that is necessary is to sow in fine, rich soil under hand-glasses or frames on a south border about the end of March; sow thinly, and allow them to remain till large enough to plant out permanently. About the middle of May they should be about 2 or 3 inches high, and transplant well. Throughout August, September, and October they flower magnificently, and are often fine in November. If required to flower earlier, sow in February in heat, and transplant into boxes or frames, and plant out about the end of April.

Phlox Drummondi grandiflora, a foot high, and Phlox Drummondi compacta, 6 inches high, are most useful border annuals and not grown so much as they should be. For small beds, the front row in borders, and edgings, the compacta varieties are delightful, while for the centre of beds, in groups in borders and in many other positions, the tall varieties are preferable. When they are desired for cutting (and the flowers are very charming for this purpose) the tall varieties should be grown. The seeds should be sown the first week in March, in pans or boxes, in light, rich soil, in a temperature of 65 degrees, and kept regularly moist. As soon as the young plants can be conveniently handled, prick them off two inches apart each way in boxes, keep them in a temperature of 65 degrees till they have begun to grow freely, then harden them off, and stop them when the growth is about three inches high. This stopping causes them to make lateral growth. Do not plant cut till the end of May, let them have good, rich soil, and they will keep up a long succession of bloom. Give them a place where they are well exposed to the sun.

There are now several varieties of mignonette, and, although there are none sweeter than the common Reseda odorata, there are some which are brighter in colour. For instance, there is the red variety, Machet, and there is the yellow, Golden Queen. The latter is a charming sort, very bright and sweet, and when sown in patches on banks of rather poor limestone soil the perfume from it is delicious. Mignonette cares but very little for rich soil, but is fond of chalk. On stiff soils mortar rubbish is much better than manure, and results in finer spikes of bloom and richer perfume.

I know of nothing else in the garden which gives us quite the form and colour of the exquisitely marked salpiglossis. The flowers are of a widely expanded funnel shape, and from two to three inches across. The salpiglossis is a very graceful plant, its flower stems curving over lightly and loosely, whole the flowers are brilliantly coloured. It makes a charming plant for beds planted with a low, rather stiff groundwork, such as dwarf asters or begonias, it is also very useful as a cut flower if arranged lightly in a suitable vase. The seeds should be sown in spring with the asters and stocks, and the plants will then flower through July and August.

I know of no annuals more useful than the sweet scabious for every purpose for which annuals are used. They are quite hardy, and succeed on every soil and under the most unfavourable conditions. The flowers are very beautiful and the colour wonderfully bright and distinct. They are very useful for cutting as they last a long time in water. A peculiar characteristic of the flower is that the pistils are thrown just above the corolla, and have the appearance of pin-heads, and this gives the characteristic name of the Pin-cushion flower

The best mode of culture is to grow these plants as hardy annuals, sowing them in the open ground in March or April. They are frequently raised under glass and treated like asters, and by this method they are in bloom early. They are of the most easy culture, and require only the simplest treatment and ordinary soil.

Annuals for hot banks are not easily selected. The majority of plants like sunshine, but they find it too much for them unless they can send their roots well down into cool soil. The best plant I know of for this purpose is the little portulaca, which thrives best in roasting sunshine,

ATTRACTIVE BORDERS OF ANNUALS AT UNIVERSITY COLLEGE GARDENS, READING.

and will even tolerate thin soil. I find it necessary in the first place to give it a little special attention, in the way of preparing fine soil, keeping it moist, and thinning in the early stages of growth, but afterwards the plants will look after themselves. The portulaca, though lowly, is not a commonplace plant. It is very beautiful, and the colours are varied, brilliant, and sparkling. It covers the ground with a carpet of exquisite little flowers, which glisten cheerfully in the sun. There are both single and double kinds, which should be sown out of doors about the middle of April.

SCHIZANTHUS WISETONENSIS.
A specimen grown in the Royal Horticultural Society's Gardens, Wisley.

In addition to those already mentioned there are many summer and autumn blooming plants, which, in beauty and duration, are as valuable as many perennials. The newer nicotianas, such as N. sylvestris and N. Sanderæ, give very useful material; they luxuriate in a heavy soil. The older white N. affinis, is also very useful. The clarkias, particularly the double variety of elegans, only need thin culture to shine brilliantly for several weeks. The annual asters, such as the Ostrich Plume, are both light and graceful. The annual chrysanthemums include some very bright forms: Morning Star, Evening Star, and Northern Star are very attractive, and the flowers last a long time when cut. A patch of the scarlet flax, Linum grandiflorum rubrum, gives a bright colour amongst other flowers.

Ten week stocks must not be forgotten; singles are worthless, but good doubles make beautiful clumps. One cannot, of course, rely on getting a majority of doubles, but in practice one does, as a rule, get 70 per cent., or even more, from good seedsmen.

The great danger with plants raised from seeds sown out of doors is that they are grown too thickly, and this means weakly growth, and a very brief period of flowering. If the various kinds are sown thickly they are likely to grow into each other, and then, even for the short time that they remain in bloom, they do not produce the effect sought. Transplanted annuals raised under glass are generally relatively better than the hardy class, because they are planted out separately.

T. B. Field.

Ashwellthorpe Gardens.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price 1s. 6d. net, by post 1s. 9d.; cloth, 2s.; by post 2s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

ANNUALS FOR THE CONSERVATORY.

Any list of "annuals for the conservatory" would be quite incomplete if it excluded some of the more tender or greenhouse varieties; these greatly enhance our list of useful kinds, and the following comprise some of the best known, and all of them are easily cultivated. In a succeeding issue I hope to deal with the more numerous and equally useful, but hardier kinds of annuals suitable for conservatory decoration.

Balsams are among the most easily grown of showy annuals for conservatory decoration. The mistake is only too frequently made of growing them in too high a temperature, and sowing the seed too early in the season. Any time during April or May is quite early enough for sowing, and at all periods of growth plenty of light and air should be given. These are gross feeders, and will take almost any quantity of manure with good results.

Browallia elata grandiflora and B. elata alba are both very pretty annuals, and exceedingly useful as pot plants during the latter part of the summer and early autumn months. They are best raised by sowing the seeds in gentle heat during the spring, and gradually hardening the seedlings. They are quite worth some extra trouble because of the abundance of flowers produced. The plants usually grow to a height of fifteen or eighteen inches, according to the treatment given, but they will bear stopping and break freely.

Diascia Barberæ is a very free flowering annual of rapid growth, and its flowers are produced in great profusion; when nicely grown the plants are most desirable subjects for conservatory decoration. The seeds should be sown during the spring, in a temperature of about 60 degrees; gradually harden off the plants.

Gomphrenas, or globe amaranths, are showy, tender annuals, requiring to be raised in moderate heat: sow the seeds in the pots in which the plants are intended to flower; six or even eight seedlings might be allowed for furnishing a 48-sized pot. Water should be given very sparingly as to over-water is absolutely fatal. The soil used should be light, porous, and not too rich, and the pots well drained; as the plants increase in size and strength gradually inure to cooler treatment.

Schizanthus hybrida and its kindred varieties are most valuable as decorative plants, or for use as cut bloom. Seeds sown during the autumn and treated in the same way as that recommended for nemesias, will produce these plants to perfection, and with little trouble.

W. Hedley Warren.

Aston Clinton Gardens.

Cissus Discolor is another very pretty climber, and one that is very useful, its velvety foliage always being admired. When trained up a pillar or on wires along the centre of the roof, from whence it should be allowed to hang down, its full beauty is displayed. It should be planted out, the foliage being much larger and more velvety then than when grown in a pot. Cuttings may be easily rooted if the young shoots are taken off with a little heel when about six inches long, and by the autumn would make really nice plants. All these stove climbers must be regularly syringed to keep them free from insect pests, so when possible they should be trained over the paths in the houses, as in this position the drip following the heavy syringing will not do damage to the plants. If subject to attacks of spider, mealy bug, or thrips an occasional syringing with paraffin emulsion is useful.—T. Stevenson, Woburn Place Gardens.

THE BACKHOUSE PLAN

of constructing a ROCK GARDEN is based upon an intimate knowledge of the principles that underlie the art of Garden Making.

A BACKHOUSE ROCKERY

reproduces natural conditions that enable the plants to produce natural effects.

EXPERIENCE HAS BEEN OUR TEACHER

and we have an intimate knowledge of Alpine Plants in their native Mountain homes, as well as in English Gardens.

This is the Secret of our Success as Makers of Gardens.

A WALL GARDEN

built on the Backhouse Plan is a lasting and ever increasing source of joy.

Scarcely a Garden exists that cannot be made more beautiful and interesting by the addition of a skilfully erected Wall Garden.

THE BACKHOUSE PERMANENT FLOWER BORDER

provides yearly a maximum of beautiful blooms at a minimum of effort and expense. Its outstanding features are: Long-Flowering Period; Artistic arrangement and harmony of colour; Sweetness, beauty, and utility of the Flowers.

We invite correspondence from all who desire expert assistance in making or developing a Garden. Interviews arranged. Plans and Estimates submitted and work executed by skilled men.

SUMMER CROPS OF TOMATOES.

The cultivation of tomatoes has now reached such a pitch that the fruits form one of the principal crops of the year, and whatever garden one may wander in, even to the cottager's, in them will be found tomato plants. The rising popularity of the tomato has been very marked during the last few years, not only for private use, but commercially, and although there may be low prices realised towards the end of summer, even then there is a margin of profit, and as seasons are seldom favourable for outdoor culture, it is not often the margin of profit is poor.

The grower who wishes to obtain the best prices for his fruits will aim at having them ripe through April, May, and June. He can, of course, have them ripe in the earlier months of the year, but there is not the demand then, and the expenses are proportionately greater. In well-managed private gardens of any extent tomatoes are generally required the whole year through, as they are used in a great variety of ways in the kitchen. The general public appear to appreciate them more when the weather becomes warmer and through the hottest period of the year. The imported tomatoes one sees for sale are useable for culinary purposes; they have no comparison with the English-grown fruits. The Channel Islands tomatoes are imported, of course, but I am now referring to importations from further overseas. English-grown tomatoes, like most home-grown fruits, cannot be equalled when quality and flavour are taken into consideration.

A GOOD CROP OF CARTER'S SUNRISE TOMATO.

Although tomatoes are grown through the winter and early spring in private gardens for furnishing a supply of fruits, the principal sowing will be made in February for main supplies. The seeds may be sown in various ways, but I prefer myself sowing in shallow pans or shallow boxes: these are preferable to pots. Tomato plants should be grown as sturdily as possible from the germination of the seed onwards. After sowing the seeds should be lightly covered, and placed in a temperature about 60 degrees. The pans or boxes should be placed on a moist base, the soil being covered with a piece of glass or paper until germination takes place, which, if the seed is new, will be in a few days. As soon as the seeds have germinated the pans should be uncovered and placed on a shelf near the roof glass, but away from cold draughts. Keep the young seedlings growing steadily in not too great a heat or too much moisture, but moist enough conditions to ensure healthy growth without sappiness.

As soon as the young plants are large enough to handle they should be pricked out into three-inch pots, two in a pot, placed one towards each side. Growers have different ways of pricking off these plants, but the use of pots possesses advantages over other ways. The soil for this purpose should be light, fairly dry, and warmed previous to use. Lightly press the soil in the pots, and give little water until fresh roots are formed. The plants should be placed in a temperature of 65 degrees, where air can be admitted on all favourable occasions. As they become rooted they should either be transferred singly into five-inch pots, or, for economy of space, be placed two in a seven-inch pot. For this potting a heavier and fairly rich compost should be used, and the plants can remain in these pots until ready for planting out, which may be done when the first cluster of flowers shows. For various reasons it may be necessary, in private gardens, to grow some plants from this batch in pots, until such time as space permits of planting out. When grown in pots it is best to stop the plant after several clusters of fruits have formed to hasten the swelling and ripening of the fruits; in other respects, whether grown in pots or planted out, cultural conditions are similar. Planting out is far the best way of growing tomatoes, giving heavier crops, and requiring less attention. Providing the drainage is right, a firm base is best for planting on, and, over this, before placing the soil some spent mushroom bed manure may be placed to the advantage of the plants.

To ensure good crops it pays to use good loam, but, failing this, the next best soil procurable should be used: with the exception of spent mushroom bed manure for the bottom layer, organic manures should not be mixed with the soil for planting. Use just sufficient soil to carry on the plants until the first clusters of fruits commence to swell, and at this stage some stimulant should be given. Some growers prefer their own mixtures, but there are now very suitable manures offered which can be used with safety and benefit. Whatever manure is used, it should be used at intervals, either sprinkled on the surface or mixed with soil for top-dressings. The times at which such manure should be given, and the quantities, will be governed by the amount of crop the plants carry.

The cordon system is the best way of growing the plants, removing all side shoots as they appear, as under this system tomatoes may be placed a foot apart. The question of stopping the leader must be determined by the length or height of the roof. Some leaves may be removed at intervals, but not in large quantities at a time. A temperature of 60 to 65 degrees during the day, with a fall at night of 5 degrees, will be a suitable temperature, according to whether fruits are required quickly or not. A moisture-laden atmosphere should be avoided, as a genial airy temperature is best, avoiding draughts when external air is cold. When the outside temperature permits a little air should be left on the house all night. Avoid low night temperature, as the tomato grows best when the air is genial.

White fly is sometimes troublesome; this can be eradicated by fumigation. Sleeping disease is sometimes seen, and if tomatoes have been grown in one house for several seasons it will be advisable to find them fresh quarters if this disease appears. Fresh soil should be provided for every crop. Black spot will sometimes appear, and any fruits showing this should be removed, and burnt at once; a good plan to follow when the fruits are setting is to tap the plants daily, which will cause the dead petals to fall after setting. The appearance of diseases in the plants may often be traced to inattention to cultural details.

Varieties are numerous, and there are many good ones among them; probably no variety has attained such popularity as Sunrise, an ideal tomato for any purpose. Hippur No. 1 is fine; it grows larger than Sunrise, and gives a fine smooth fruit, solid, with small seed space. If I were limited to two varieties for general use I should select these, and that after growing most varieties in cultivation. For exhibition purposes there are Perfection, Duke of York, Queen Alexandra, and Hillside Comet, while as a yellow Golden Jubilee is good.

For dessert and garnishing purposes very pretty and attractive varieties will be found in Yellow Peach, Yellow Pear, Yellow Plum, Yellow Cherry, Red Cherry, and a very fine form of Red Currant, producing extra-long racemes of fruit.

T. H. Slade.

VEGETABLE MARROWS.

The vegetable marrow is counted amongst the choicest of vegetable dishes in nearly every household, and, consequently, it is sought after over as long a period of the year as it possibly can be produced. The plant is somewhat tender, makes little progress during cool weather, and the least frost kills the foliage, and, possibly, the vine also. Therefore it is necessary to afford protection by placing glass over the earliest and latest plants. To carry a supply through the season successfully three sowings should be made, one early in February, one about the middle of March, and another in July for producing the latest supply.

First Sowing.

The seeds should be sown singly in well-drained 60-sized pots, in soil consisting of loam lightened with sand and leaf-mould. Place them in a temperature of about 60 degrees, and as soon as the plants are nicely up and have formed their first rough leaf subject them to a lower temperature. An ideal position is a shelf near the glass in a newly started vinery or peach house, which usually is kept at about 50 degrees. If the seedlings are potted as they proceed in growth good plants will result, and be ready for planting out towards the end of March. Where ample appliances exist, and a pit can be spared, the marrow may be planted out over a mild hotbed, and grown and trained similarly to melons, but in 10 or 15 degrees lower temperature: failing this, they can be grown quite satisfactorily over a mild hotbed in an ordinary garden frame. The soil should consist of good loam lightened with leaf-mould and sand, and made moderately firm when planting.

Air must be admitted on every favourable day, but cold draughts must be avoided: this will serve to build up strength, and check a rampant and unprofitable growth. During bright afternoons the plants may be syringed, and the frames closed early to husband the sun heat. For the night a covering of mats will be necessary to keep the frame snug from cold winds. When female flowers appear they should be pollinated during the middle of the day, while dry. A little later the climatic conditions will bring fertilisation about naturally, because as the season advances more air can be gradually given, and the pollen is distributed. Top-dress with soil as the roots appear to require it, and apply water more liberally as growth and crops increase.

Second Sowing.

This sowing will form the main crop for the summer and early autumn supply. The seeds should be sown singly in 60-sized pots, and in soil similar to the earliest sowing. During the early stages of growth the plants may be grown in a temperature of about 50 degrees, but must be given the lightest position near the roof glass. Sickly, drawn, potbound plants will only give second-rate results, so the building up of strong healthy plants is of the first importance. After they have attained to a good size, with several leaves, gradually subject the marrows to more air, in order to harden them for planting out in their final quarters some time in May, under handlights.

The situation I prefer for this midseason crop is one not fully exposed to the hot sun, but a semi-shaded spot yet not so much so that the sun cannot reach the plants during a considerable part of the day. Under these conditions marrows keep their foliage and retain their vigour well into the autumn. It is generally known that the marrow plant requires a rich, deep soil, and it is the practice often to put them on manure heaps, and let them romp away into growth. This serves to hide unsightly places, but it is not necessary for their culture.

The most successful and simple method that I have found is to dig out holes, in such a position as suggested, about three feet deep and as far across, and fill them with two-thirds turfy loam and one-third of rich manure, mixed together, forming a slight mound. Three plants are placed on each mound, and the protection of handlights retained until the weather is sufficiently warm to encourage a free growth. As soon as root activity is seen a liberal amount of water is necessary at about once a week: this is much more preferable to light and more frequent waterings. After the plants are in bearing doses of liquid manure should be given.

Third Sowing.

If this is made about the beginning of July in pots, the natural heat at this season will cause the plants to make rapid headway, and they will soon be ready for planting out. The chief aim of this sowing is to provide plants of full vigour to come in after the main crop is practically over. A high and warm position should be chosen, and the plants so arranged that frames can be placed over them on the approach of cold weather. If they are lightly cropped, and liberally treated, they may be expected to carry on the supply, in an average season, through the month of November. In the event of early and severe frosts threatening, a covering of mats to the frames may be found necessary to avoid a check.

Moore's Cream I consider to be a good all round variety, while Hibberd's Prolific, Bush, and Improved Long White are also excellent for general culture.

C. Flack.

Cholmondeley Castle Gardens.

ZONAL PELARGONIUMS.

The zonal pelargoniums, though not quite so much thought of just now as the perpetual carnations, are, nevertheless, some of the most useful and most widely-cultivated of greenhouse plants, and when well grown, they make one of the brightest and most pleasing displays, either in the greenhouse or conservatory.

Unlike most other soft-wooded plants that have just one season of blooming, these may, with very little trouble, be had in bloom the whole year through. Sweet pea enthusiasts are apt to rave over the colours of sweet peas, and they indeed are beautiful, but when compared with the purity and richness of colouring of some of the better forms of zonals, I am afraid they would be found wanting. Of course, there is room out of doors for sweet peas and there ought to be room in every establishment for a good batch of zonal pelargoniums, particularly where a large conservatory has to be kept bright the whole year through. Many plants, as beforementioned, have just one season of blooming, but the zonal pelargonium will fill up a gap, and make things bright at any time of the year.

It is not necessary to be propagating all through the year, but two good batches should be grown, one for summer-flowering, and the other for the winter. For the former, a good batch of cuttings should be put in any time after July, and before September, and at this time they will root readily almost anywhere, but I prefer to put them singly in thumb pots, standing them in a frame, where a light may be put over them during the hot days (with a little shade), or during wet weather. As soon as nicely rooted, we pot them up into large 60's., potting firmly, but using a fairly light compost. After potting, they are placed on a shelf in a cool house, and if they show any tendency to run up, we pinch out the tip of each, which induces them to break; here they remain throughout the winter, moderately dry and just warm enough to keep them growing. By the middle or end of February, they are in a fit condition for a further shift, using 32-sized pots, as these are quite large enough for most decorative purposes. For this potting a fairly holding mixture of loam, leaf-soil, and sand is used, not too rich, and by potting firmly a very compact growth is obtained; we keep the plants in an ordinary greenhouse temperature, and when fairly well rooted give plenty of ventilation, stopping the young shoots when necessary, and allowing six or seven weeks from the time of stopping until we want them in bloom. Plants treated in this manner should be in good condition by May, and continue to flower till well on to the autumn.

For autumn or winter flowering we insert cuttings during February or March in an intermediate house, and treat pretty much as for the summer flowering ones, but after they are nicely rooted in the 32's we stand them out in the open air preferably on boards, and in a position where they get all the sun possible; in this case also the stronger growing shoots are stopped to induce a bushy habit of growth, but this is done not later than August, though if the plants are not wanted in bloom till fairly late in autumn or early in winter the flower buds may be removed until they are required.

Early in September we remove the plants to a light airy house, giving them plenty of room to prevent the shoots becoming drawn, and as the winter advances we keep the atmosphere of the house dry, particularly when the plants are in flower, and the temperature between 50 and 60 degrees, according to the outside conditions. From here they are passed on to the conservatory, in which they remain until the flowers drop, when they are returned to recuperate.

During the summer months, should the conservatory be fairly light, pelargoniums will go on flowering for weeks at a time, but in the winter it may be found necessary to frequently change them.

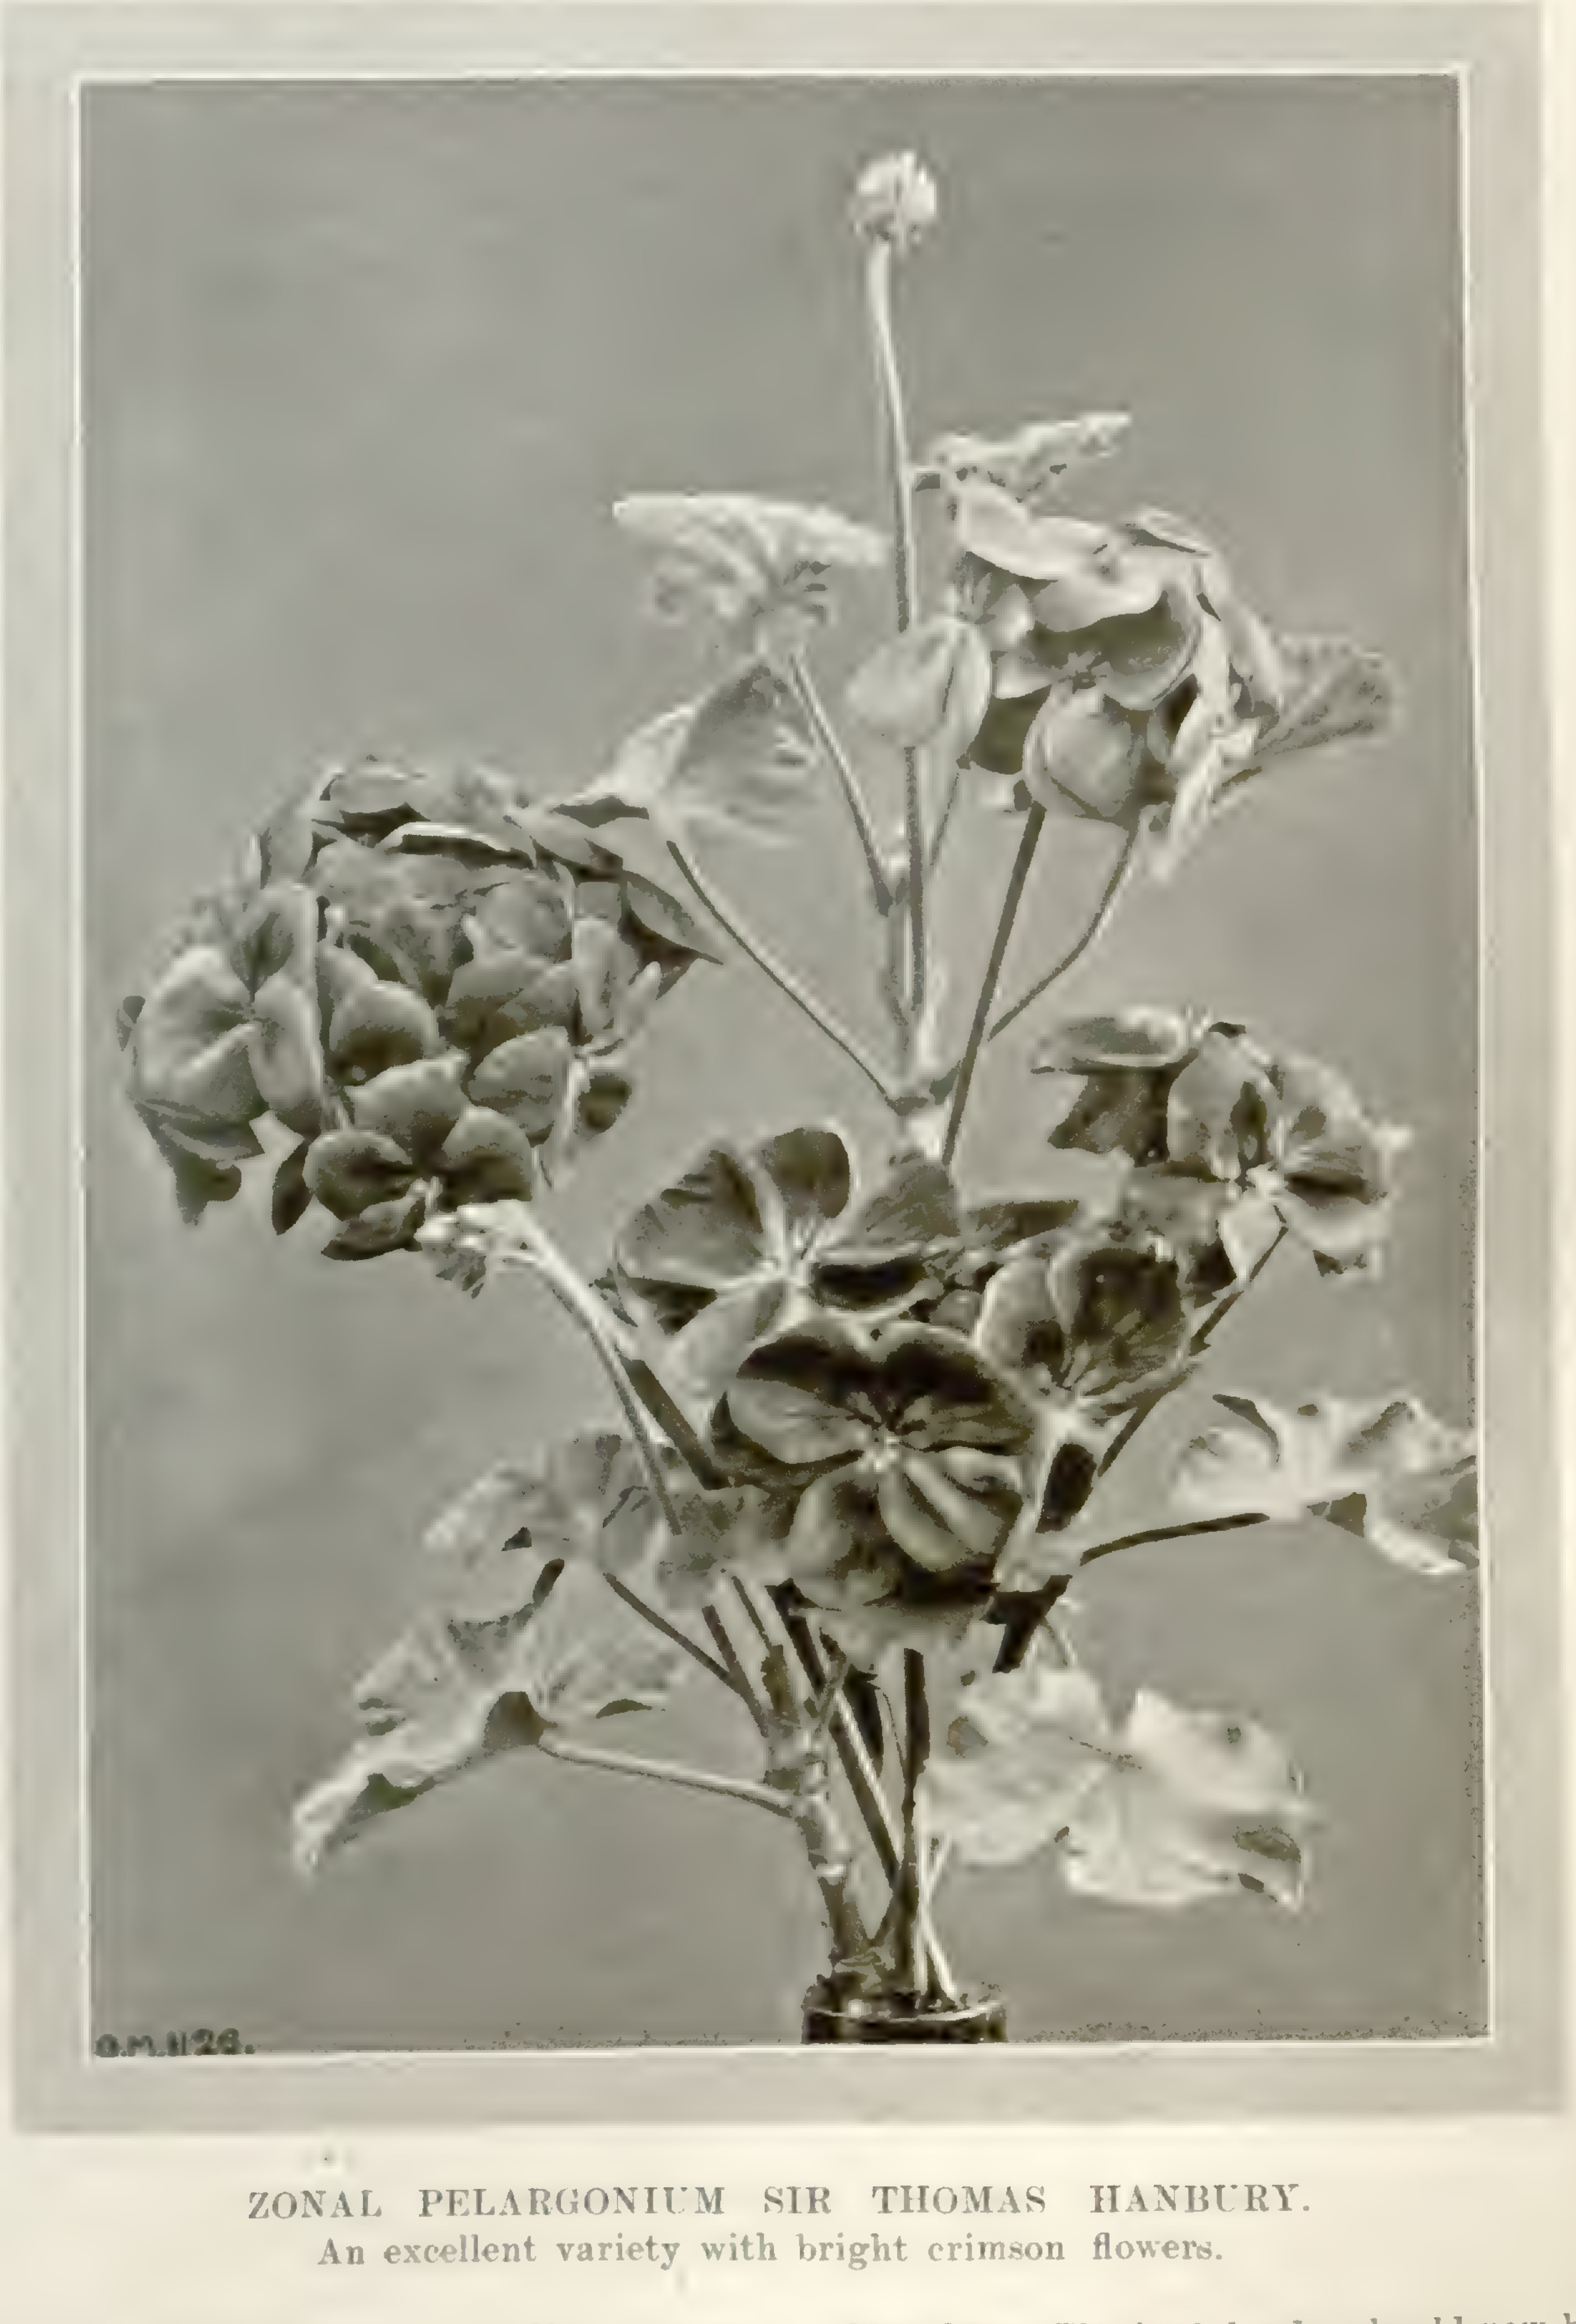
A point to be borne in mind is the watering, and at no season should this be overdone; water sparingly, and do not use liquid manure until the plants are well in bloom, as it is not long sappy growths that produce the most flowers. Specimen plants are sometimes useful, particularly during the summer months, and good-sized examples in nine-inch pots may be produced if some of the spring-struck plants are grown on, and not allowed to flower during the winter, shifting them into larger pots early in the spring; or even after flowering, if some of the best-shaped plants are potted on, and the points of the shoots pinched out, they will soon recover, and make really good specimens by August. These larger plants will take more feeding without growing gross than will the younger ones.

The single varieties are undoubtedly the most showy, and, with the exception of a very few of the semi-doubles, are also the most floriferous; varieties are very numerous, and, as with all other florists' flowers, are increasing rapidly, but a selection from the following will give satisfaction to the most fastidious. A few good crimsons or crimson-scarlets are Saxonia, Aldenham, Charles H. Curtis, Sir Thomas Hanbury, The Sirdar, and His Majesty. These are all very fine varieties, and the last-named is, I should say, the finest crimson zonal pelargonium ever introduced for winter blooming; it was exhibited by Mr. Page in November last at Vincent Square, and received an Award of Merit, and these same plants are still covered with blooms, the individual pips measuring fully three inches across.

Among the cerise or softer toned scarlets are Mentmore, Chaucer, Fred Bean, R. C. Pulling, and Princess of Wales. Purple and magenta shades are Cymric, Lusitania, Madresfield, and Frogmore, while good pink shades are Lady Folkestone, Caledonia, Mrs. Toogood, Hatfield, Mrs. Brown Potter, and Caronia. The best salmon varieties are Countess of Jersey, Mary Carmichael, Carmania, and Campania, and of these I give preference to Mary Carmichael, this being a good bright salmon, and a very free bloomer. Of whites there are many, but Mary Beaton, I think, stands alone, the truss, pip, and colour being all that one desires in a white zonal pelargonium.

A few good doubles and semi-doubles are Beauté Poitevine, salmon; G. Ernick scarlet; Madame du Plantz, apple blossom colour; Ville de Poitiers, scarlet; Fraicheur, white, with pink margin to petals; and Goldfinder, orange-scarlet. It often happens that good batches of double white and scarlet varieties are in demand during the winter months, and whether for pot plants or as cut flower, F. V. Raspail Improved (scarlet), and Hermione (white) are I think, the two best that can be grown for the purpose. T. Stevenson.

Woburn Place Gardens.



ZONAL PELARGONIUM SIR THOMAS HANBURY.
An excellent variety with bright crimson flowers.

VIBURNUM CARLESI.

This Corean species is one of the most beautiful of recently introduced hardy plants. In a few establishments it has been cultivated for five or six years, but it is still one of the rarest of flowering shrubs. At Kew several examples may be seen, the largest one, a plant rather more than 2ft. high and 2½ft. through, being planted in a heath bed near the pagoda. This specimen for several years past has blossomed freely, the flowers being in rounded inflorescences 2 to 3in. across. V. Carlesi is recognised by means of its oval, serrate leaves, which are hairy on both surfaces, and have a greyish tint, and by its rounded heads of rondeletia-like flowers. The flowers have a thick waxy texture, and are white, slightly tinged with pink when fully expanded, the pink being, however, more in evidence in the unopened buds. The expanded blossoms are accompanied by a delightful clove-like fragrance, which may be detected from a distance of several yards.

When first received, doubts were entertained as to its hardiness; but subsequent experience has, however, proved it to be perfectly hardy, so far as ordinary winters are concerned, at any rate. The Kew plants had no protection last winter, and, although the buds were formed in the autumn, none were injured. On a few occasions flowering specimens have been exhibited at the fortnightly shows at the Horticultural Hall, but no well-grown examples have been available, those exhibited being small pot plants. Under ordinary conditions it blossoms in May. It thrives in light soil and is increased by means of cuttings. D.

Herbs.—The herb border should now be dealt with, and increased, or otherwise, as needed. The perennial kinds can be increased by division. Mint can be propagated from sturdy cuttings taken from the boxes that are in the forcing pit should an increase of this be required. The thymes, where they do not naturally seed, can be increased by cuttings and division of the plants. Sage should be propagated yearly to maintain nice sturdy plants, choosing "slips" with a heel attached during April. All herbs are very partial to leaf-soil and grit, and they should have a sunny position.—G. Ellwood.

For pretty gardens and lovely flowers read The Flower Garden, by T. W. Sanders, F.L.S. An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted for outdoor culture. Price 7s. 6d. net, by post, in box, 8s., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London

THE MAKING OF A LARGE ROCK GARDEN.

Where there is abundance of room and a suitable site a large rock garden may be made and so planted as to form a splendid feature of any establishment, public or private. In the pages of the GARDENERS' MAGAZINE there have appeared from time to time charming views of many of the more notable rock gardens in the country, and these have shown that rock gardening may be adapted to almost any size of garden. For the moment large rock gardens are the consideration, and one's mind at once turns to those at Kew, at Edinburgh, at Leonardslee, at Warnham Court, at Friar Park, and that very wonderful one at York, in Messrs. Backhouse and Son's nurseries. This latter was one of the first of prominent rock gardens to be designed and furnished, and infinite trouble and patience were taken to make it notable. It is one of the boldest of these garden features, and in early summer it is worth a long journey to see.

For the present I propose to confine my further remarks to the famous Kew rock garden, believing that an account of its history and design will be interesting, and helpful to those who may propose forming a rock garden of their own on a fairly extensive scale.

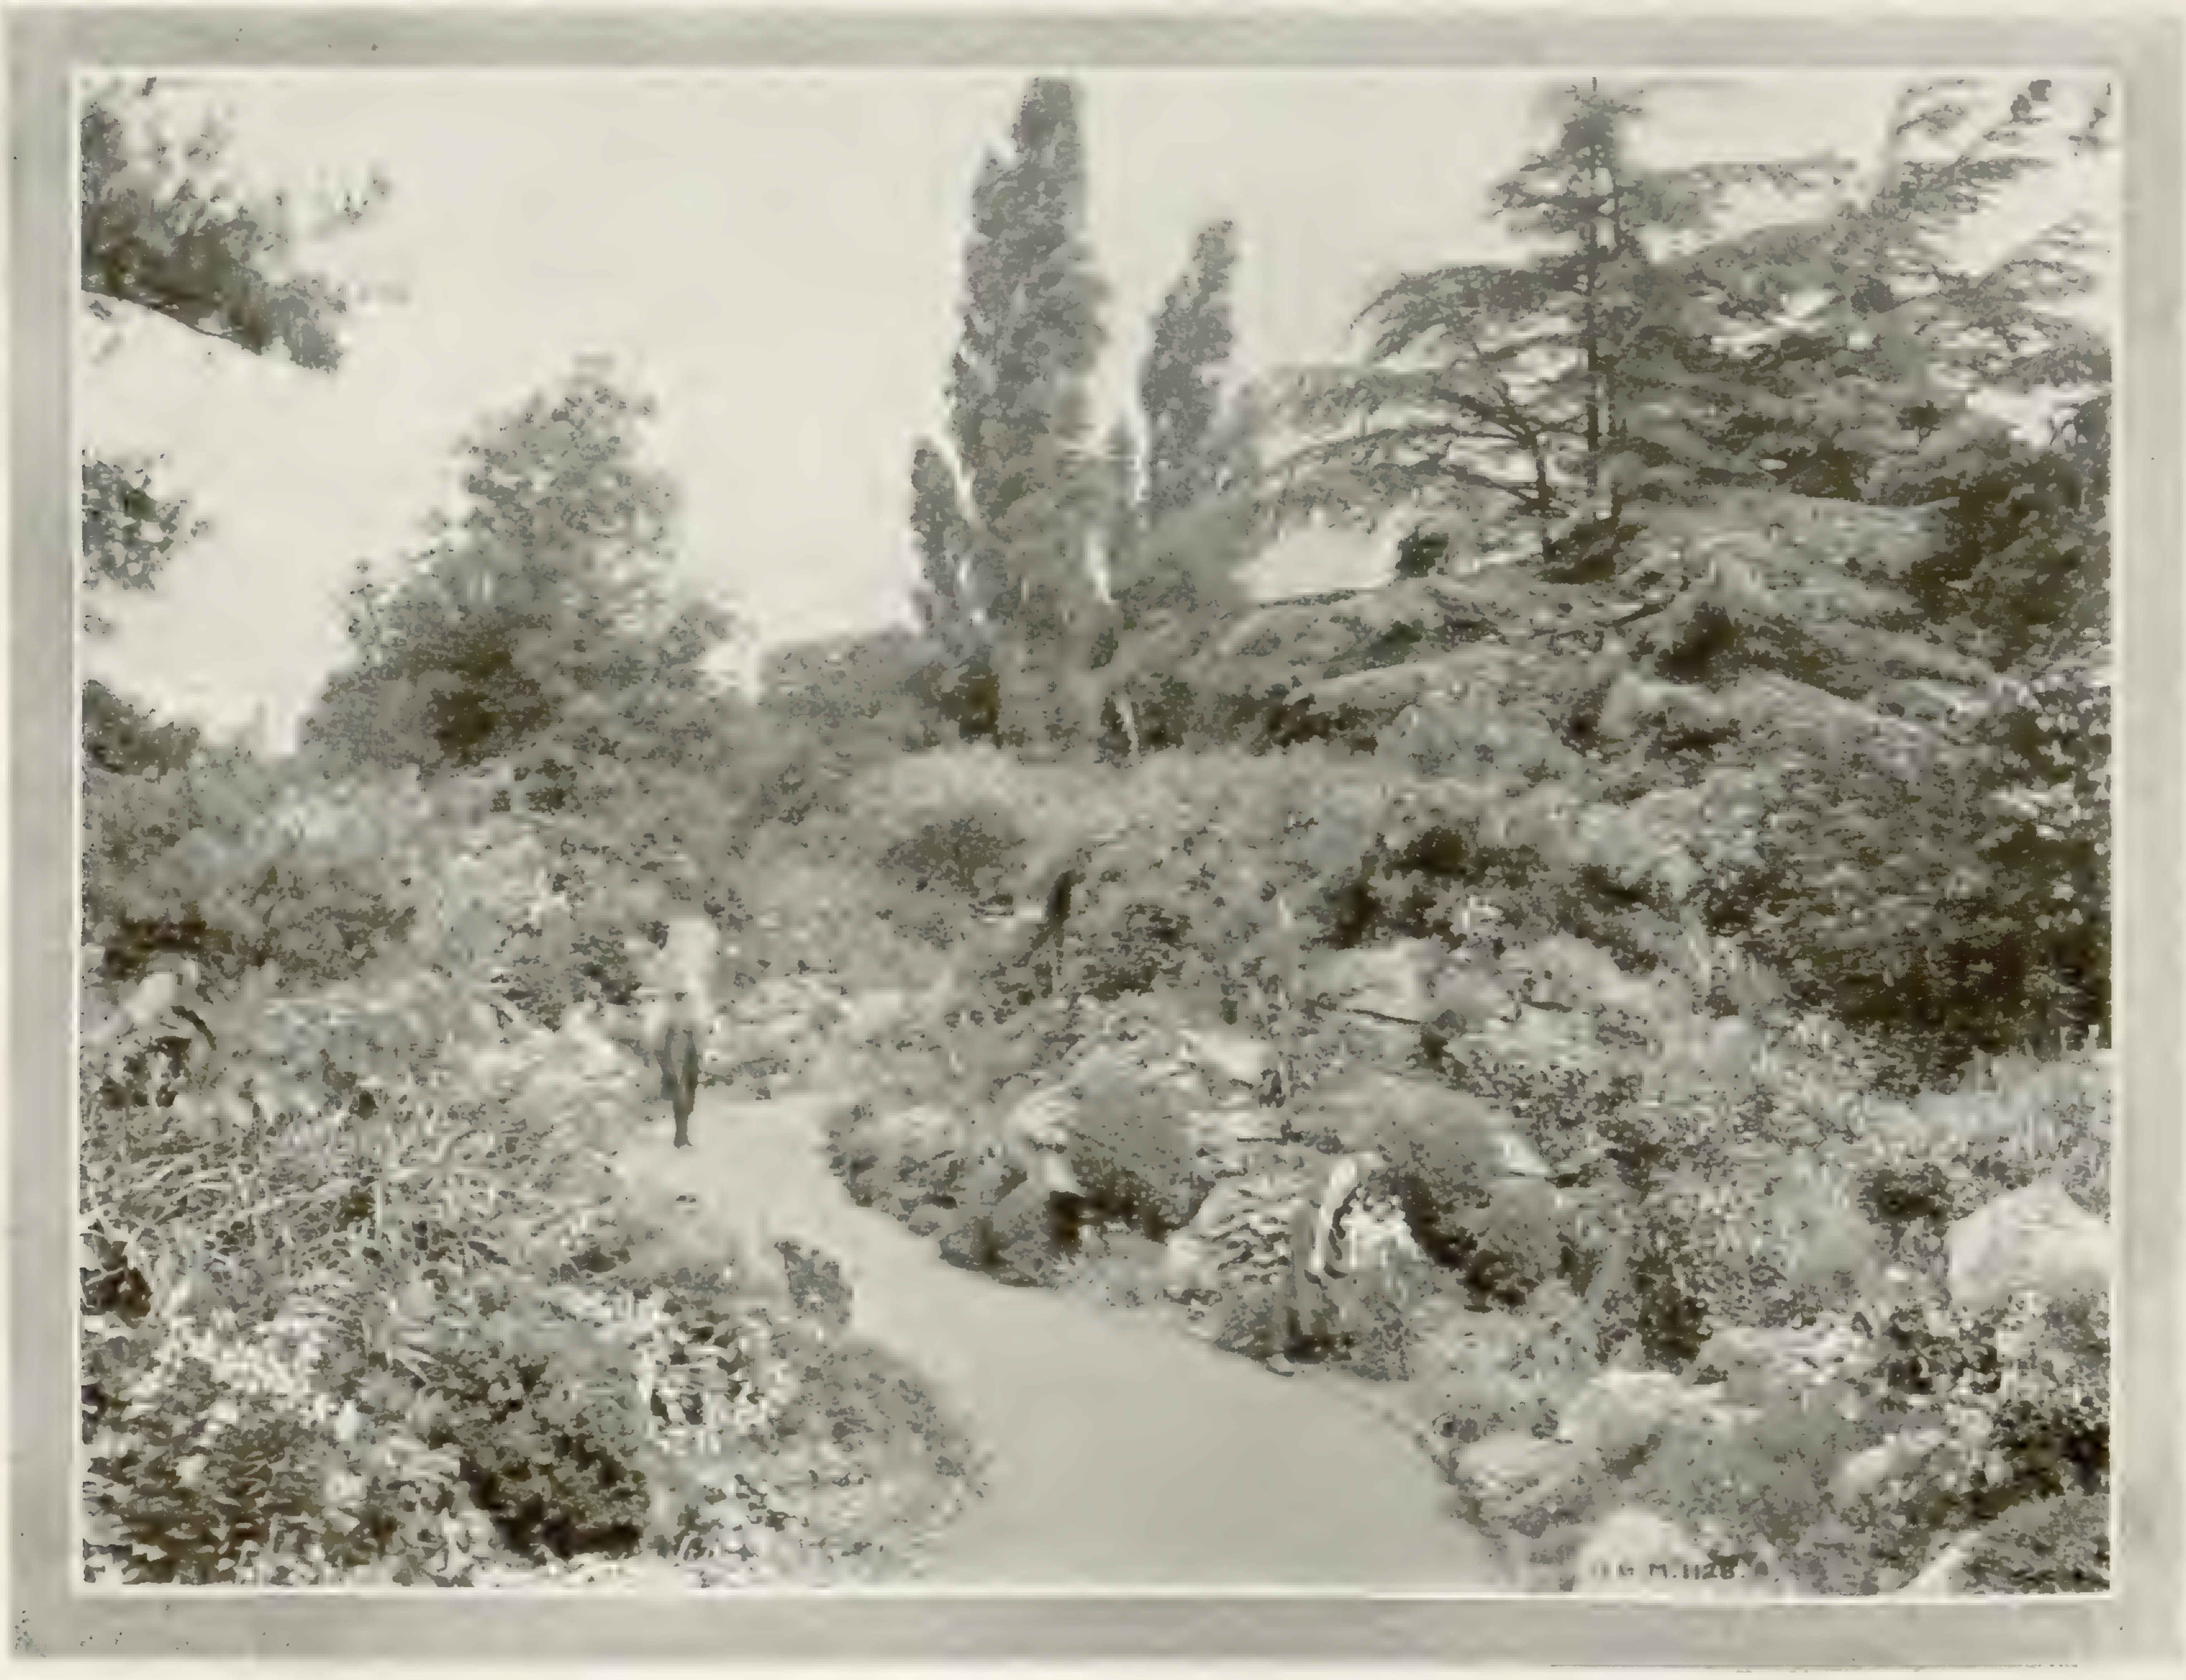
Kew, on account of its level surface generally, does not lend itself to the formation of an imposing rock garden such as many of those indicated above, where the contour of the ground permits, and even aids, in forming an effective structure quite in keeping with the surroundings. **Therefore it had to be constructed in such a manner, and with the means available,** that it harmonised, to a certain extent, **with its own surroundings.**

Before the year 1882 there was no rock **garden worthy of the name at Kew, that** which had done duty for it being the site of the present hardy fernery by the old ice well. In that year a fine collection of herbaceous and alpine plants was bequeathed to Kew by Mr. George Curling Joad, of Oakfield, Wimbledon. It then became necessary to provide a suitable place in which to grow the plants, and a moderate grant of £500 was procured from the Treasury in order to build a rock garden.

The piece of ground chosen was quite level, and the general idea was to copy one of those narrow mountain watercourses common in the Pyrenees. In these places the stream dries up in summer, although in winter it is a raging torrent. The stream brings down and scatters along its course fragments of rock and other debris, which are left stranded. During summer a luxuriant vegetation springs up and clothes the banks, at the top of which we also find vegetation of a shrubby character.

Having decided on the general design, the valley was excavated, and the soil was thrown up so as to get height for the sides. The broad gravel path represents the bed of the stream. In a private garden the **gravel might be replaced by an irregular** broken path of stones with more effect, but as Kew is a public place, the convenience of crowds of visitors has to be provided for. The valley runs, roughly, north and south, and is 180 yards long. It winds about in order to give a series of effects, **and, what is more important, a great variety of aspects suitable for the needs** of various plants. At the different curves **the soil was thrown up into higher mounds,** and covered, like the banks at the top, **with shrubs and trees to shut out the immediate** surroundings. This carries out the idea of the Pyrenean watercourse, and gives a sense of seclusion.

The rocks and stones used are of a very mixed kind, but nothing better could be done at the time with the money available. The materials of an old ruin which existed in the Arboretum, known as the "Stone House" were used, but the evidence of their having once been part of a building could not be hidden. A quantity of finely weathered oolite was obtained from Bath, while the north end was finished off with waterworn mountain limestone from the cliffs at Cheddar.



VIEW IN THE ROCK GARDEN AT KEW. [Photo: E. J. Wallis.

All these sources, however, did not furnish sufficient material for building up the banks, the higher mounds being almost entirely kept up by roots, which were freely used. They were very good makeshifts and enabled the original plan to be carried out, while at the same time the coarse-growing herbaceous plants revelled in the humus formed by the decaying wood. Tree stumps, however, do not last long, and require constant attention as to renewal. Their use in a rock garden is not to be **recommended, as the decaying stumps form a convenient harbour for all kinds of vermin.**

To give variation of outline the sides of the valley were scooped out into bays of various sizes, and filled with suitable soil to accommodate different kinds of plants. Near the south end is a dripping we formed like a cave, having a supply of water running from the top and forming a pool at the bottom. It is then led off in a small stream which feeds the boggy bays on each side of it. In this bog the most effective plants are the rodgersias, notable for their handsome foliage, the Japanese Primula (P. japonica), the Himalayan P. rosea, with the globe flowers (trollius) and marsh marigolds (caltha) along the edge of the stream. Smaller plants, like soldanella and parnassia, also find a home near the edge of the bay. Seaside plants are accommodated in a bay which is made up with sea sand, and which is devoted to plants like the horn poppy, sea holly, sea pea, thrift, marram grass, and other salt-loving plants. Near the south end, in a deep recess, are to be found the ramondias, growing between the joints of the stones, while on the lower level, as well as on the shady top of the bank, the various species of Himalayan and Tibetan poppies (meconopsis) are at home. In the same recess may be found the lady slipper (Cypripedium spectabile), with the Sikkin primrose. Near here also is a colony of the types of ferns found wild in Britain, as well as a fine mass of the Royal Fern (Osmunda regalis). This end of the rock garden is also rendered attractive in summer by a quantity of the willow gentian, which is naturalised on the banks in both blue and white varieties.

A PART OF MESSRS. BACKHOUSE AND SON'S ROCK GARDEN AT YORK.

One of the most popular features to many is the wall built of large, shaped stones from the ruin aforementioned. Over these are draped curtains of candytuft (iberis), Alyssum saxatilis, and aubrietia, and they produce a charming effect when in full flower.

Some of the Atlantic cedars on the taller mounds were removed a year ago. They had reached such a size that, although they added to the picturesque effect, their presence so close was not advantageous to the small alpines for which a rock garden is intended. The further away large trees are kept from the rock garden the better it is for the plants, and some of the trees still standing are considered by many to be too large, and exclude too much light.

Half-way along a path branches off and leads up some steps to the herbaceous grounds, and on each side of it is found a collection of the saxifraga family, the different kinds of which keep up a succession of flower from February to June. The smaller kinds, like S. Burseriana and S. apiculata, are among the earliest, while the flowering period reaches its maximum in May and June with the larger forms of S. Hosti, S. cotyledon, and S. longifolia. A little further on another path leads from the opposite side up to the orchid houses.

From time to time, as the opportunity has occurred, parts of the rock garden that had been built originally with roots, have been remade with weathered oolite from a quarry belonging to Lord Redesdale, as well as with sandstone obtained from other sources.

As the natural soil of Kew is a hungry sand, it is not the best medium for growing plants in, and this, taken in conjunction with the usually hot, dry summer climate of Kew, prove that the conditions are not all in favour of the plants. There is plenty of water available, but overhead watering is often more harmful than otherwise.

Taking into consideration all the surrounding conditions and difficulties, both with regard to situation and soil, the Kew rock garden is eminently successful in design and fitness for the position it occupies.

Kew. W. Irving.

COLUMBINES.

Aquilegias, or, to give the old-world name to old-fashioned flowers, columbines, are certainly charming subjects for many phases of garden adornment. The ease with which columbines can be grown, their graceful leafage, and the delightfully diverse colour range which they embrace, mark them as favourite subjects for the majority of garden lovers.

In the herbaceous borders colour groupings of the aquilegias are certainly beautiful, especially if one takes care to arrange the newer and best shades of the long-spurred hybrids separately, and here and there insert masses of those exquisite art shades which are to be met with among the old English A. vulgaris. Of these latter there are some very charming rose shades, while among the whites, soft lilac blues, and the deeper colourings one meets with some very effective forms.

For naturalising in the wild garden, and by woodland and meadow walks, the columbines are very serviceable. The tall, graceful masses of blossom, waving lightly above a groundwork of grasses and wild plants, produce a pleasing spectacle, and the manner in which they propagate themselves by their profuse scattering of seed, makes their naturalisation a certainty.

Then, again, the rock garden is enriched by the inclusion of some of these charming dwarf mountain forms, which are as interesting as they are beautiful. I would suggest that the rarer columbines be given a trial by those who are the fortunate possessors of a rock garden. One cannot grow everything, but a few of these alpine gems would be a good investment. A. alpina, for instance, large flowered, violet and white, is of great merit, while its variety superba is also very fine. A. cærulea, again, if one can obtain the true Rocky Mountain species, is a delightful study in blue and cream. The blossoms are long-spurred, and both the type and its best varieties, including the golden lutea, are grand in the rock garden. The dwarf form of A. canadensis, known as nana, is very bright in its colouring of yellow and cinnabar red. A. flabellata, the beautiful little waxy white from Japan, is very good, early, and large in blossom. A. formosa another valued rock garden form, is continuous in blossom, and very showy, being a combination of green, gold, and red. In A. glandulosa we have another valued species. In its typical form it is rare, but its dwarf habit and clear blue and white blossoms are very appealing. Its hybrid form, Stuarti, is rather taller, but gives much the same tone of colouring.

Other sterling rockwork forms include A. pyrenaica, probably a miniature Pyrenean form of alpina, which comes early into blossom; A. oxysepala, also early, a dwarf blue and yellow of pleasing appearance, are rare Tyrolean gems. A. thalictrifolia, with its pretty leafage and smallish deep lilac blossoms also possesses much beauty.

For general garden planting the various hybrid groups offer a wondrous diversity of colourings. I would especially advocate the merits of the cærulea hybrids, which give such a dainty expression of beauty, and such exquisite colourings; nothing more pleasing than these can be imagined among aquilegias. Where a rich touch of colour is needed then one could group some of the best of A. californica hybrids, obtaining thereby rich hues of red, orange, and yellow. The hybrid forms of the native A. vulgaris are exceedingly numerous, and should be represented if possible; Atrata, Hænkeana, Witmanniana, and Munstead White are typical of this section, which rank among the glories of the old-fashioned flower gardens.

A. chrysantha and some of its best varieties should be included for their clear yellow colourings, while the bright orange-red and gold of A. Skinneri is favourably regarded in many quarters. In addition to the foregoing there are many distinct columbines which are deserving of note. For instance, the shades of blue which one has in the Asian A. Kitaibeli, and the European A. grata, A. Einseliana, and A. Bertolini, are charming indeed, while A. baicalensis, a fine blue and white, the bright red and gold A. truncata, and the showy Japanese A. Buergeriana, which resembles A. flabellata in form, but varies from white to red-purple in colouring, are both interesting and showy in blossom.

The value of the whole group of aquilegias, either for the borders or for cutting, or in the wider domain of the rock and wild gardens, is certainly considerable. Especially would I commend to the reader a study of the various species, and the culture of the finer strains of hybrid forms, knowing full well that the extended culture of the columbines means an added wealth to the garden. P. S. Hayward.

THE PREPARATION OF VEGETABLES FOR EXHIBITION.

The production of vegetables for purposes of exhibition entails a very high and excellent standard of cultivation, but to secure the best results the exhibitor should remember to attain the greatest degree of excellence and utility for the table.

During recent years the consideration given by judges in determining the relative qualities of staged vegetables has undergone marked changes, and the enormous size and bulk of some vegetables which at one time was the foremost consideration, has now given place, in a great measure, to the quality and general utility of the vegetable shown. As a guide to those who wish to enter the lists of prize winners, the following hints on the production and preparation of different vegetables for exhibition purposes may not prove out of place, and the beginner must remember that under modern conditions quality, cleanliness, beauty, and good and uniform size are the most important points.

Celery.

Celery ranks as one of the finest vegetables for all culinary purposes, and in any exhibition of garden produce it should occupy a premier position. Seeds are sown about the end of February in a gentle heat, and as soon as the young seedlings can bear handling they are pricked off into boxes, about four inches apart. A good rich soil, to which has been added a fair proportion of leaf-mould and a suitable quantity of stable manure, will prove an admirable medium. About the middle of May trenches are prepared, and the young seedlings planted therein, careful attention being given for the first few weeks to watering. It must be remembered that excessive applications of liquid manure will tend to produce a rank and coarse growth, while if the plants are given too little water, especially in their earlier stages of growth, they are extremely liable to bolting, though this is just as likely to happen if watering is carried to excess. The celery stalks, when placed upon the tables for exhibition, will be most successful in gaining prizes if they are thick, crisp, and firm in texture, and well blanched; absolute cleanliness is essential, and no specks of dirt or abrasions should be observed, while, when the stalks are cut, there should be no signs of flowering shoots.

Cucumbers.

These require to be sown about eight or nine weeks prior to the time of exhibiting. When sufficiently large, the plants may be potted in rough leaf-mould and planted out after a fortnight has elapsed, in a suitable house. A warm, humid atmosphere must be maintained, and, as regards soil requirements, a good fibrous loam, mixed with a little soot and lime rubble, will be found most suitable. All superfluous growths must be pinched out, and only the straightest and most evenly formed fruit retained; liquid manure may be given at judicious intervals. When staged, cucumbers should be straight, and even in size, the flesh firm, tender, and fresh, the outer skin being of a deep green colour. A long neck or nose will prove a great drawback, and it is necessary that a flower should be attached to the latter.

Cauliflowers.

Cauliflowers occupy a very high position in all exhibitions of vegetable produce. The first week in March is the most opportune time at which to commence sowings, and if a slight heat can be obtained at this stage so much the better. The next operation will be to prick off the seedlings into cold frames in rich soil, while about the middle of May they may be planted out in ground which has been deeply trenched and heavily manured; great care must be exercised to prevent the plants receiving any check, as this generally results in "blindness." The evil effects of strong winds must be counteracted by earthing up, and immediately the heads begin to show some shade must be provided, as by undue exposure to the sun's rays the delicate white heads will quickly become discoloured. A good medium-sized head, compact, and perfectly spotless, and of a pure unsoiled white colour, will prove most successful.

Cabbages.

The many varieties of cabbages never fail to make their appearance on the tables at exhibitions, and to produce successful plants for this purpose a very rich and well-drained soil is essential, and heavy dressings of stable manure or some approved fertiliser equally so. Seed may be sown at the beginning of August, and the plants pricked out into cold frames at the end of October. In the following spring the plants are carefully lifted and planted in ground which has been deeply trenched and heavily manured, the drills being not less than three feet apart; the application of a good mulching of farmyard or stable manure, or some approved chemical fertiliser will prove beneficial, and after cultivation will consist of drawing the earth up round the stems when the plants have attained a height of from six to nine inches. Firm, medium-sized hearts will prove most successful, and the outer leaves should appear quite fresh, tender, and succulent.

Carrots.

For exhibition purposes carrots are sown at the beginning of April, the drills being fifteen inches apart; a deep sandy loam that has been well manured for a previous crop, and turned over one spit deep in spring, will be most suitable, and the seed bed should possess a very fine tilth. Continual hoeing between the drills when the seedlings are established will conserve the moisture in the soil, and promote a free and sturdy growth, and, when sufficiently large, the seedlings must be thinned out to about six inches or eight inches apart, while, to prevent drought, the ground must be kept constantly stirred with the hoe; the alternative being to give a good mulching of lawn grass or manure. Roots of even and uniform size, perfectly straight, clean, and free from all blemishes or abrasions, are most desirous.

Broad Beans.

A deep loam of a sandy nature which has been deeply trenched during the previous winter will prove most suitable for this vegetable, and should preferably be rich in decaying vegetable or animal matter. Sowings are made in February for early shows, and in April for later shows in September or October, the drills being about thirty inches asunder, and from six to eight inches between each one. When the plants are about nine inches in height the soil should be drawn up round the stem, and during periods of drought the hoe should be in constant service, while when the pods are set liquid manure may be given with very beneficial results. Fair-sized pods of a fresh green appearance, filled with tender succulent seeds, will prove most successful in gaining awards.

ROCKERIES FOR SMALL GARDENS.

The owner or occupier of a small garden who takes pleasure in his flowers is generally anxious to make the most that is possible of the limited space, and how to do this is a problem the solution of which affords much room for thought. Much depends upon the tastes of the owner, but it is wonderful how soon a liking for certain plants will develop provided that a beginning is made with them, and admiration for a few is experienced. Thus it is well to consider what systems of gardening can be adopted to utilise the limited space to the best advantage.

Where cut flowers are not required in quantity, few phases of gardening will afford so many opportunities for thorough utilisation of a small space to the greatest advantage as the cultivation of rock plants. How to achieve this is the aim of the notes which follow.

A SIMPLE ROCK GARDEN AT THE HOLT, HARROW WEALD,

The residence of A. Kingsmill, Esq.

By means of rockeries the space of a small garden may be increased, as the elevation of the rockery affords room for trailing plants to hang over the stones, and thus they take up less room than on the level; while many of the alpines are so neat in their growth that a great variety can be embraced in an area which would only afford a very limited space indeed for any other plants. Thus, apart from the fact that these alpines are mainly of exquisite beauty, such flowers are admirably suited for the small garden, and it is a sorry one indeed if some of these alpines cannot be cultivated within its narrow bounds. Given a comparatively free air, sufficient light, and freedom from the drip of trees, a vast number of rock plants can be cultivated successfully, provided that the soil is made suitable and the rockwork properly formed.

No elaborate rockery is required for the small garden, and alpines can be as well, or better grown on a simple structure than on one of expensive construction. Stones of almost any kind—although a porous one is best—may be used, and even slag and old bricks stuck together with cement and washed over with the same material to hide the joinings will serve our purpose. It is more essential that these stones should be properly laid, and no method is so well adapted for the small garden as what is known as the "terrace" or "pocket" system, by which the rockwork is formed of a mound of some soil, or rough material well mixed with soil, and converted into a series of terraces by means of stones, these, again, being subdivided by stones set across so as to form compartments, so to speak, for the accommodation of each plant. Even the latter may be omitted, and a series of terraces alone, flat, or almost so, on the surface, will do admirably. But the stones should be firmly fixed in the soil, so that a foot can be set on them without involving their displacement, and so that the winter's frost will not move them.

The elevation of the rockery is of little importance if it is arranged on the terrace or pocket system, but it should not be too great for the small garden, and a simple mound or series of such some three feet high will afford room for two terraces with a flat portion on the top for the alpines which look best there. Even a simple rock bed, formed of a mound of earth supported by stones of about nine or twelve inches in height round the margin, over which trailing alpines can be grown, and with a few boulders inserted here and there in the bed, will do excellently for many good and choice plants. Where there is space enough a series of low rockeries, with paths between, will be suitable for the small garden, but the breadth of the paths must be proportionate, or they will spoil its appearance.

The soil for the bulk of the mound need not be of special quality, and the writer has cultivated these plants successfully on rockeries, with its greater part composed of small stones well filled between with common soil of a medium nature of lightness, and covered a foot or so with better earth for the purpose, composed roughly of loam and leaf-soil in about equal parts, with the addition of some sharp sand and grit, so as to make it porous and light. A layer of drainage of rough stones at the base of the rockery is useful where the soil is not naturally porous, or where no other drainage is provided. But the earth must be made firm, and all crevices filled up, so that the roots, which frequently penetrate to a considerable depth, may find soil, and not air, when they push further down. As has been said, the terraces should be flat or nearly so, the idea being that the rain or water artificially applied should penetrate to the earth and not run off, as is too frequently the case with rockeries built without due consideration. It is too frequently forgotten that many alpines like plenty of moisture at their roots, but prefer their foliage fairly dry at most seasons.

Regarding the plants suitable for small gardens there is a superabundant choice. The truth is that the difficulties of growing alpine flowers are greatly exaggerated, and there is little mystery attached to the cultivation of quite a multitude of them. They must, however, be planted firmly, and it is a great advantage to many that they should be well jammed in between stones, with other stones laid firmly round their crowns. The stones can be embedded in the terraces, and the plants placed between.

Only a running survey can be made of the leading plants which can thus be successfully cultivated on the small garden rockery. Aubrietias are, of course, indispensable, and are superb in their season when trailing over the stones. They do fail, however, in some parts of our large cities, especially in wet districts, but, as a rule, they are thoroughly satisfactory, and can be preserved in the worst of places by protecting them with a sheet of glass elevated a few inches above them in winter. For the small garden the arabis is not so good, but a plant or two of the double form of Arabis alpina, or the small single one called A. albida nana compacta, with, say, Arabis Sturi, will be worth having. The little spring phloxes of the subulata or setacea class should not be forgotten, and here the sheet of glass will be useful in wet parts of the country. P. Nelsoni, P. subulata Fairy, P. s. The Bride, and others will occur as some of the best among a number which make a selection impossible, as all are beautiful. P. reptans may be added, and one or two of the forms of P. canadensis. Androsaces are not for the beginner, although they can be grown well in the small garden in sunny places, and with plenty of grit. Saxifrages are a host in themselves, and a representative collection of the different sections will give much delight. So, too, will the sedums, or stonecrops, which, with the sempervivums, or houseleeks, are indispensable for hot and dry places. Achilleas supply excellent material, as do the smaller helianthemums; while in all the dwarf campanulas we have an endless variety of beauty.

Acænas, dwarf anemones, coronillas, hardy cyclamens, the many alpine dianthuses, or pinks, alyssums, dwarf hardy geraniums, perennial iberises, potentillas, primulas, thymuses, veronicas (shrubby and herbaceous) violas, waldsteinias, soldanellas, geums, and a manifold variety of other flowers—common and rare—may be cultivated with success on the rockery in the small garden, so that it may become a very Elysium to its owner and his friends.

The residence of Col. the Hon. C. F. Crichton.

SEED SOWING ON CLAY SOILS.

The difficulties to be contended with in the management of clay land, compared with those to be met with in the treatment of soils of a free working description, have, I venture to say, to be experienced to be appreciated. These difficulties present themselves in each detail of the soil's management, though in no other in a more pronounced manner than is the case at the time of seed sowing, and it is relative to this subject that I purpose to make some remarks.

Unless land of this character is skilfully treated, there is usually, even in favourable seasons, trouble experienced in securing it in good condition for the reception of small seeds, especially for those sown early in the year. In all practical cases for crops to be sown at that season it is advisable to trench the ground in the autumn, or early in the winter, before it becomes very wet, and in doing this the bottom spit, after being broken up, unless it has been, by years of good cultivation, made equal in quality to the top, should be left in the bottom, and the surface be left in a level, though moderately rough state. Seasonable opportunities invariably occur early in spring in which to crop land that has been left exposed to the elements in this condition during winter. In cases where land remains over winter in an undug state the digging should be attended to as early in the year as weather permits of its being properly done, and no attempt should be made to crop it until its surface has been ameliorated by the weather's action, for it is much better, in order to secure perfect tillage, to be reasonably late in sowing, than to sow under a bad state of cultivation.

The mode of digging known as ridging cannot be recommended for soils of this kind, for though by this process the surface can be exposed to the fullest possible extent to the beneficial influences of frosts and air, these benefits are counterbalanced by the evils that arise from the furrows placed between the ridges becoming wet and consolidated from the effects of rain and snow.

It sometimes happens after the soil has been finely worked and planted with seeds that heavy rain batters its surface and causes it to become crusted, and so hard as to render it impossible, unless some artificial means are adopted to assist them, for the young plants to push through it. In instances of this kind it is good practice to catch a favourable opportunity, before the soil becomes too dry and hard, to carefully break its crust by gently tapping it with the teeth of a suitable garden rake. We have saved crops of carrots for example by this means. Years gone by, however, when our garden soil was more difficult to work than it now is, we used to specially prepare soil with which to cover small seeds. The onion crops, for instance, were sown in this way. A commencement was made by drawing a drill at the side of a plot, in which seeds were distributed, covered with prepared soil, and with a rake made even on the surface, and this process was continued until the work was completed. By

The Kelway Garden is a Garden Beautiful

Kelway Hardy Herbaceous Plants give an air of distinction to any garden, with their fine upstanding stems and bold, richly coloured blooms. Grouped in the

KELWAY ARTISTIC BORDER

they provide a feast of successive colour for the greater part of the year. All Kelway plants are from strong country-grown stocks, which flourish under almost all conditions of soil and climate.

The Kelway Booklet, "Gardens of Delight," sent post free for 6d. (returnable to subsequent customers); it contains full particulars of the Kelway Garden

SPECIAL REDUCTIONS IN PRICE OF RHODODENDRONS, etc.

We hold the largest Stock of **RHODODENDRONS** in Great Britain, all extra fine, bushy stuff, grown 1,000ft. above sea-level; being recently transplanted are in a splendid condition for removal. Special reduction will be made to clear land of the following:—

RHODODENDRONS, which can be supplied by the hundreds of thousands, in sizes from 1ft., 1½-2ft., 2-2½ft., 2½-3ft., and 3 to 4ft., by the doz., 100, or 1,000 to suit purchasers. **PONTICUMS, HYBRID SEEDLINGS, BLANDUM, CAUCASIAN PICTUM, CUNNS** (white and blush), **JACKSONII,** choice named varieties; extra fine, clean stuff.

AZALEA PONTICUM, 1 to 4 ft., extra fine.

CUPRESSUS, in all varieties, from 2 to 6 ft.

HOLLY COM., from 1, 2, 5, 6, 7, 8, and 9 ft. high; extra fine. **HOLLY HODGENSI, MADERIENSIS,** and **SHEPHERDI,** in all sizes.

LAURELS in variety, from 2, 3, 4, 5, 6 ft. high.

YEWS, ENG., from 1, 2, 3, 4, 6, 7, and 8 ft. high; extra fine stuff.

ORNAMENTAL TREES, FOREST TREES, PLANTS FOR HEDGES, GAME COVERTS, ETC., in large quantities.

We extend a Courteous Invitation to Inspect our Nurseries, 300 acres in extent.

Inimitable Collection of

WAVED SWEET PEAS.

This splendid selection of varieties includes all the finest varieties of their respective colours (except novelties), and is recommended with every confidence. The approximate number of seeds in a packet is put in brackets after the name.

	Per pkt.—s.	d.
Clara Curtis (25), pale primrose, waved	0	3
Countess Spencer (50), fine pink, waved	0	3
Etta Dyke (25), large fine white, waved	0	3
Evelyn Hemus (25), buff, with reddish edge, waved	0	6
Flora Norton Spencer (25), grand bright pale blue, waved	0	6
Helen Lewis (50), fine orange pink, waved	0	3
John Ingman (25), rich rosy carmine, waved	0	3
Menie Christie (25), rich rosy purple, waved	0	3
Mrs. Routzahn (25), apricot suffused pink, waved	0	6
Mrs. H. Sykes (25), large fine blush pink, waved	0	6
St. George (25), rich orange scarlet, waved	0	3
The Marquis (25), large rosy mauve, waved	0	6

Collection of the above Twelve Splendid Varieties—Special Price, 3s. 6d.

JAMES CYPHER and SONS, EXOTIC NURSERIES, CHELTENHAM.

these means we at no time failed to secure good crops.

Probably one of the most common errors made in sowing early crops upon cold clayey soils is that of sowing too early. Seeds sown when the soil is in a bad state of tillage, or too cold to promote their ready germination, cannot well produce first rate crops. As previously intimated, it is far better to sow later, and secure a favourable seed bed. In suitable cases seeds sown under glass, and the young plants subsequently transplanted out under favourable circumstances, give excellent results.

T. COOMBER.

The Hendre Gardens.

SUMMER SALADS.

In all well-arranged households the salad gives a tone to the daily menu, and a dainty, piquant assortment of leaves, stems, and roots, each having distinct characters, is at our disposal for giving variety to it. Summer salads, in a sense, are required, and should be in evidence, from Easter until frost puts an end to their crispness. Of course, in all gardens good lettuces form the most important of the plants grown, and very frequently the only leafy one; this is a mistake, and to rectify it, and give variety and flavour, the delicately curled endives, when grown, are highly appreciated summer salads. Properly bleached, when fully grown they cannot be compared with the wilted specimens that too often emerge from the mushroom house during the winter months. Good salads are made or marred by the dressing, but as this is outside the provider's curriculum, we must confine ourselves to catering for a regular supply of the various things most desired.

Of course, in private gardens, what the owner requires most of must be most largely provided; at the same time it is well to remember that some of the most appetising and piquant salads are often condemned because cultural methods have been insufficiently attended to. We have lettuce, endive, mustard, cress, tomatoes, cucumbers, radishes, and onions, and during later summer beetroot and celery. There are many other things also that receive attention in Continental countries, where the art of salad making is better understood.

If we desire to commence in April, the lettuces for meeting the demand at this date will have been sown during the previous autumn, and for frame culture the smaller early hearting varieties are to be preferred. There are Tom Thumb, Commodore Nutt, Golden Ball, Golden Queen, Early Paris Market, and Little Gem. Any of those named, sown during October, and once pricked off into other frames, boxes, or pans, grown very cool to keep them healthy and sturdy, and finally transplanted to a very gentle hotbed about the middle of February, will form close tender hearts by April. A very excellent cabbage lettuce for providing salad from the open border at this date is Stanstead Park, and, in the cos variety, that most excellent lettuce for quality, Bath Black-seeded. We have many excellent summer lettuces, both cabbage and cos varieties, and what constitutes a good summer lettuce is crispness and a tendency to remain in good condition over as long a period as possible after the heart is fully formed. March sowing, in many counties, is safe, and an open position is better than one shaded. All the Year Round, Milly Forcing, Heartwell, Victoria, Ideal, Satisfaction, or a good Drumhead type, will suit all requirements for summer cabbage lettuce; cos varieties are Hardy Winter White, Paris White Cos, Prince of Wales or Ideal, Eclipse, Express or Dwarf Perfection, White Heart, Paris Grey, Peerless or Jumbo Cos. All those named are really good lettuces, and two or three of each type, at the most, will meet all requirements. Successional small sowings are of greater utility than larger sowings from which several plantings could be made.

Practically the same cultural details serve in the case of endives, only the moss-curled or finer green-curled varieties are required for summer use. Complete bleaching of the heart when the plants have reached a useable size is the chief point. To accomplish it during the warmer summer months is a very simple matter, but to ensure the full flavour, and retain the natural crispness if the weather is dry, water must be given to the roots, and the blanching done where the plants are grown. Very thin sowing of both lettuce and endive in drills where they are to mature gives the best results in dry districts, merely thinning the plants in the rows according to the varieties grown.

Whether radishes are what it is intended they should be is a point that rests entirely with the cultivator. My favourite types are French Breakfast and Carmine Forcing, both rather small radishes, but of full flavour, with adequate substance when proper cultural methods are followed. There are very many forms of radishes, but even when well grown some of them are watery and flavourless, and, moreover, bring discredit upon the grower. Therefore, for the private table the best selections will do the grower the most credit. Cultural details are so simple that it almost amounts to presumption to lay down rules, but it may briefly be said that continuous sowings at regular intervals in rich light soil, with plenty of water, and some shade during the hottest sun, will give good returns. Carmine Forcing matures under a month from the date of sowing, and French Breakfast takes only a few days more. If there are empty frames during the summer they will provide the best places for growing radishes in; failing these, small beds large enough for a week's supply will suit best. If long varieties are wanted there are nice rose-coloured and brighter scarlet forms of the popular Wood's Frame.

Mustard and cress will grow almost anywhere, but here again detail in method for keeping a regular supply will tell. If the regulation quantity of each for each sowing is soaked for twelve hours or so, both kinds will come along at the same time. Frame, bell glass, or handlight culture is best, fairly thick sowing, a confined atmosphere, and darkness to produce silvery, tender stems, and just sufficient light when growth is made to give colour to the cotyledons, are practically all that is required. The onions most appreciated for giving variety to salads are the Silver-skinned, and the White Lisbon is also a favourite sort. As these are only required in a quite young state several sowings are necessary, and boxes are the most convenient receptacles for them; for salads the tender green tops are more needed than a pronounced basal portion.

Tomatoes are always appreciated as summer salads, either in combination with other things or merely served alone. The ideal tomato is a fleshy one, and a good Comet or Satisfaction type will provide it. Some of our newer tomatoes are beautifully shaped, sell well, and are very free setters, but they contain enormous numbers of seeds, which is against them for private use. A yellow variety I have always grown, and like very much, is Sunbeam. For a cooling July salad in which the cucumber has a part, the Prickly Ridge varieties are too much ignored; the shapely hothouse fruits have their place as superior beings to adorn the table whole, they do not, however, possess that mild, yet full, flavour so much appreciated in young Ridge fruits. As appearance goes a long way, the only claim for the Ridge varieties over others is their more hardy nature. An April sowing for planting in a sheltered nook in May is all that is required.

In late summer celery and beet salads are much in evidence in some establishments; the last-named is also much used for garnishing and including in leafy mixtures. For maturing quickly the Globe varieties are the best, and of late years they have improved in colour. Cheltenham Greentop also reaches a serviceable size early, and is a fine red colour, and very tender fleshed. Being susceptible to frost they may not be sown until the end of March; even then protection may be needed if the weather favours early germination. Some people like celery early, others prefer it at a more natural season. White Plume or White Gem are good early maturing sorts. I have always found it most convenient to grow early celery in beds, the frame ground often forming the site. A rich manure bed above ground to retain moisture is necessary, six inches deep, with two or three inches of soil on the top. For blanching quickly paper is the best material to use. March sowings of the varieties named, with proper culture, are ready for use in July.

A herb much used for soups and salads is tarragon. I have always found it a profitable one to grow near a town. My most satisfactory results were obtained by systematically forming a new bed annually from the young shoots during April, merely detaching them with a few root hairs, and dibbling them an inch apart in good soil. Mint is sometimes sparingly used in summer salads, and for good colour and succulence beds must be annually formed as described for tarragon.

CHARLES FOSTER.

Guildford.

POPULAR SWEET PEAS.

The publication of the result of the Election of sweet Peas (page 124) will serve as a most useful guide to the small grower of these popular flowers. From this list he can select few or many, and can easily obtain the colour description of any variety he may not be cognisant of from any vendor's catalogue. When we find as many as 117 varieties in one list, 100 in another, 98 and 86 in others, it must be difficult indeed for the beginner to make a selection of, say, one or two dozen varieties, which is a good collection for many cultivators, even those not regarded as "small" growers.

If we take the first twenty-four names in the list on page 124 we find a good selection; none of the varieties are really new, but all are quite desirable, and plainly prove that even the newest of varieties do not meet with general favour. From many sources one can hear the great outcry against the length of lists, which becomes more bewildering yearly, and will, I am certain, do harm in the future. Many amateur growers are so disgusted with the disappointments obtained after adding many new sorts as listed in catalogues, that they are afraid now to add to a selection of well-known tried varieties.

E. MOLYNEUX.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

ANGULOAS.—The different members of this genera are now producing their growths, which will also be accompanied by the flower buds. Some are not so free flowering as others, and the shy blooming kinds are those that usually flower latest in the season. I often think the too liberal treatment afforded at the later period accounts, to some extent, for the plants failing to flower. The first to commence growing is Anguloa Clowesi, and it is rarely indeed that we find any difficulty in successfully flowering this species. The plants having rested in the conditions similar to that afforded to the dendrobiums during the winter, where the atmosphere is retained in a reasonably dry state, and with a cool intermediate temperature. Under these conditions they have enjoyed a perfect rest, and the pseudo-bulbs have had the benefit of all available light. Very little root moisture has been afforded, and in due course the flowers appear at the base of the developing growth.

LATE-FLOWERING ANGULOAS.—Now with the later flowering kinds I do not consider circumstances so favourable, unless special precautions are taken to afford them the same conditions as the early-flowering kinds received. Under ordinary conditions the blinds are brought into use by the middle of March, and the increase of moisture provided in the atmosphere has a tendency to encourage rapid growth, which is generally obtained at the expense of flowers. If we give these later-flowering kinds dry airy conditions, with only sufficient root moisture to keep the pseudo-bulbs in a plump state up to the time that the flower buds are seen, and then transfer to warmer conditions, where more liberal treatment is given, they will do better.

REPOTTING.—This is best attended to almost immediately after the plants have passed out of flower, as it is then the new roots are produced, and when potted at this stage the roots soon become re-established in the new compost. It is undesirable that the plants should be annually repotted, and where a good lasting material is used the plants should not be again disturbed unless they require more root space or the compost has decayed. A thin layer of chopped sphagnum moss should be put on the surface of the compost, because the plants require such a prolonged resting season that the moss invariably dies, and where the surface is covered thus it is easily removed, and replaced with living moss annually in the spring. I find that a potting compost of about equal proportions of turfy loam, fibrous peat, and osmunda fibre, with some chopped sphagnum moss, silver sand, and plenty of broken crocks intermixed is suitable. This should be made moderately firm. The pots should be clean, and drained to about one-third their depth. During the growing season the plants may be placed in the stove or warmest house, and every encouragement must be given to encourage rapid growth.—H J. Chapman, Oakwood Gardens.

STOVE PLANTS.

STOVE CLIMBERS.—As most climbers will be now pushing into growth the present will be a very good time to pot those that require it, and those that do not need repotting will be all the better for a general overhauling, taking care that the drainage is in good order, and afterwards giving a top-dressing of whatever material is suitable to their requirements.

BOUGAINVILLEAS AND ALLAMANDAS are of much more rampant growth than the dipladenias, and certainly they do not require as much heat, therefore, if there is choice of two houses in which to grow them put these in the coolest. Pot culture hardly does justice to either of them unless they are just grown as specimen plants, so where space is available they should be planted out in a narrow border, and given a mixture of loam and peat or loam and leaf-soil, with some sand added. They require a considerable amount of water at the roots during the growing season, and when flowering liquid manure should be freely used, and they will continue to bloom over a considerable period. I consider these by far the most useful of our stove climbers.

STEPHANOTIS.—This probably is the most common of stove climbers, and generally admired for its scent, otherwise I think it somewhat overrated, as the flowers certainly are not of much use for decorating, unless there is much making up to be done. If pruned as advised in an earlier calendar it should now be growing away freely; pay careful attention to training, otherwise it will soon get out of hand.

GLORIOSA SUPERBA.—Tubers of this beautiful plant should now be potted up, 12inch pots being a very suitable size in which to grow them. If sufficient bulbs are to hand part of them should be kept dry for a time, so as to form a second batch, as their flowers are so very handy during the late summer and autumn for vases.

TEMPERATURE.—The temperature of the stoves may now be allowed to run up during the day with sun heat, keeping down the fires as much as possible, nothing being so detrimental to the well-being of newly-potted plants as an excess of fire heat. At the same time, care must be taken to prevent a sudden fall, which may happen at this time of the year, owing to a change of wind, or sudden cold showers.—T. Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

LATE VINERIES.—Directions were given in a previous calendar for preparing to close vineries that contain such late grapes as Appley Towers, Lady Hutt, and Lady Downes. In order for these grapes to have favourable weather in which to ripen perfectly, and thus be in the best condition to keep for a lengthened time, the houses should now be closed. Provided the best use is made of the sun's warmth, the vines syringed on fine days in the morning and afternoon, and a moist atmosphere maintained, no artificial warmth will be necessary until the buds begin to burst. The buds upon young rods, especially those of Lady Downes, invariably "break" badly, and with these extra care should be taken by bending down the upper part of each rod in order to regulate the flow of sap and induce the buds to break regularly. As the fruit and wood of the Black Hamburgh attains maturity in a comparatively short space of time, late houses of this grape should not be closed until the buds commence to burst.

EARLY PEACH HOUSE.—The disbudding of shoots should be judiciously followed, until finally there remains only sufficient of the most suitable of them to properly furnish the trees with wood to supply next year's crops of fruit, and assist the development of the present crop. Commence, as soon as they are of sufficient length, to lay in the shoots by securing each with a tie placed near its base, and keep the leaves clean, and free from red spider by thoroughly syringing them with tepid soft water in the morning and early afternoon of fine days. Except upon growths that are thickly set with fruit earnest thinning of the crop should not take place until fruits are about the size of field beans, after which it should be gradually done by removing the smallest and most badly placed fruits, completing the operation when the stones of the fruits begin to harden. One fruit to each square foot, or slightly more in the case of very robust trees, or varieties with small fruits, is enough for a crop. Test the borders at suitable intervals, and when necessary give efficient supplies of tepid water, and afford diluted farmyard liquids, or light top-dressings of suitable artificial compounds when stimulants are needful.

TOMATOES.—The lengthening days are in every way favourable to winter-fruiting plants, and assist the latter part of their crops to ripen, which should be regularly gathered as the fruit becomes fit. Encourage root action by affording light top-dressing of fresh compost, and give weak liquid manures at each alternate watering, but avoid keeping the soil too wet. A night temperature of 60 degrees, with a corresponding rise by day from sun heat, will be suitable. Successional plants should be planted out or placed in their fruiting pots as soon as they set their first trusses. Sound loam, to which fine mortar rubble and wood ashes are liberally added, together with a dash of bonemeal, answers well as compost. When potted place the plants in a light house, and train them on a trellis placed near the glass. Regularly remove lateral growths, pollinate the blooms every day, and should white fly be troublesome vaporise the house at necessary intervals.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

CUCUMBERS.—If the seedlings have made good progress they will be ready for planting out on the prepared hotbed, which should be made four to six days previous to planting, to allow the bed to settle down and the compost to get thoroughly warmed. A suitable compost at this season is three parts turfy loam, one part flaky leaf-soil, and a little mortar rubble to keep the whole sweet and porous. Place the same evenly over the hotbed material, and at a distance of three feet apart arrange mounds, eight inches deep, to receive the plants. Plant, and stake to the bottom wire, at which position the growth should be stopped; train thinly, and do not overcrop. Maintain a moist atmosphere, but water the plants very carefully till well established. A temperature at night of 65 degrees, rising to 85 degrees by day in sunny weather, will suit them well.

AUTUMN-SOWN ONIONS are now ready to receive their final planting, providing the ground is in a working condition. Lightly fork the surface over, and add a good dressing of burnt rubbish during a fine morning, and lose no time in planting during the afternoon, for the season, so far, is very treacherous and trying, on heavy soils particularly. The plot should have been previously trenched and manured, as this crop amply repays the extra time and material spent on it, as the onions come in when kept onions are scarce. Plant in rows drawn at 1ft., observing the same distance from plant to plant. All spare plants should be taken from the seed bed, and planted thickly and firmly on a narrow border for early use, as they will bulb more quickly so treated.

CABBAGE.—The weather, so far, has been very trying for this indispensable vegetable. Every assistance must be afforded it by frequent stirrings of the soil, with a broadcast sowing of soot and wood ashes occasionally. Never allow the soil to rest until a free growth has commenced, when a small sowing of nitrate of soda, with an equal part of soil, will be very beneficial if applied very carefully between the rows.

POTATOES.—Where these are stored in clamps or pits they must now be overhauled, removing those intended for seed into a light airy position, or much vitality will be lost through forced blanched growths. Every encouragement should be given them to form strong and short sprouts preparatory to the April planting. If a change of seed is contemplated lose no time in securing it.

THE FRAME GROUND.—Cauliflower, lettuce, endive, globe artichoke, etc., that are wintering in cold frames should have every attention afforded them, in the way of airing, watering, and removal of decaying matter, thus preparing them for their quarters in the open ground.

MUSHROOM HOUSE.—Place rhubarb, seakale, dandelion, chicory, and endive regularly in the mushroom house, so that no break occurs in the supply.—Geo. Ellwood, Swanmore Park Gardens.

EVERGREEN DENDROBIUMS.

To deal with the subject of evergreen dendrobiums in a short article is by no means an easy task. There are from ten to fifteen species forming the evergreen or semi-deciduous group of dendrobiums, but I have decided to confine my remarks especially to two or three of these.

It is for the information of amateurs that these notes are penned, and I would like in the first instance to point out that the whole of this class of dendrobiums are out of favour or fashion for the time being among prominent orchid specialists, and thus are procurable, in practically all cases, for a very moderate outlay. The plants are best secured in an imported state, and as importations reach this country during the spring, it is quite possible that they may be selling at the time these notes appear in print. The temperature required for practically the whole of this class is as follows: From November to February, night temperature, 55 degrees; day, 60 degrees; from February to April, 60 to 65 degrees by night; day temperature, 70 to 80 degrees, with sun; May to August, night temperature, 65 to 70 degrees; day, 75 to 95 degrees, with sun; September and October, night temperature, 60 to 65 degrees; day, 70 to 80 degrees, with sun.

The taller growing kinds, such as D. chrysanthum, D. fimbriatum, D. pulchellum (Dalhouseanum), D. densiflorum, D. thyrsiflorum, D. chrysotoxum, D. suavissimum are best accommodated by being grown in well-drained pots. The pots should only be sufficiently large to contain the plants comfortably. There is no class of orchids that resent a great bulk of potting compost about their roots so much as do these dendrobiums. Select a good lasting material, such as osmunda fibre, and brown fibrous peat, mixed with chopped sphagnum moss. Sufficient coarse sand and finely broken crocks should be added to render the compost open and porous. This is essential, as the plants require an abundance of water at the roots during the growing season, so that all possibility of stagnation is guarded against. Repotting should be attended to when the plants commence to grow, after flowering in the spring and early summer.

Such kinds as D. Farmeri, D. aggregatum, D. atro-violaceum, D. bigibbum, D. Brymerianum, D. Dearei, D. phalænopsis, D. spectabile, and others of the dwarfer growing kinds, are best suited by being planted in shallow pans or baskets; the potting compost required being practically the same as that mentioned above. As the growing and flowering seasons of several of the kinds enumerated above is at totally different seasons of the year, discretion must be used by the cultivator, and the particular conditions provided according to the growth, flowering, and root developments.

In my opinion, the most suitable kinds for cultivation by amateurs, and where space is limited, are D. densiflorum, D. fimbriatum, D. thyrsiflorum, D. Brymerianum, D. chrysotoxum, and D. suavissimum. During the active season of growth, May to October, these plants require a hot, humid atmosphere, with an abundance of strong light, only sufficient shade being required to prevent the scorching of the foliage. The hot, humid conditions can be secured by a discreet use of the roof ventilators, and the proper consideration of the help derived from the sun's rays during the hot months of the late summer. After growth is completed the plants take a prolonged season of rest from November to March, and only sufficient root moisture is then necessary to prevent the shrivelling of the foliage and pseudo-bulbs. As soon as the flower buds show signs of development in the early spring, an occasional syringing overhead, when the outside conditions are favourable, will greatly assist them. As soon as the flower racemes can be clearly discerned, the plants should be removed from their resting quarters, and placed under growing conditions which will facilitate the development and expansion of the flowers. As soon as the flowers have expanded, the plants may be removed to a cooler and drier atmosphere where they last in perfection much longer than when left in a warmer house.

I find D. thyrsiflorum and D. densiflorum two of our most useful summer flowering orchids for use as flowering plants in the house. There is nothing more effective than a finely flowered specimen of D. thyrsiflorum, and the flowers last in perfection for two or three weeks in a cool drawing-room.

The insect pests most troublesome are thrips—both black and yellow thrips attacking the foliage of the dendrobiums and causing permanent disfigurement. Greenfly is also troublesome, but fumigation at regular intervals, and spraying with some safe insecticide keeps these pests in check.

H. J. Chapman.

PORTULACAS.

The reason why these beautiful little annuals, which for brilliancy and delicacy are scarcely surpassed by any other, are so comparatively little grown is perhaps to be sought in the conditions of our climate, which, even in the South of England, sometimes provide insufficient sunshine for the highest development. They are sometimes known as sun plants, and travellers say that they have seen them extremely fine in gardens in the hottest and driest parts of India and Egypt Those who have hot, dry beds or borders, or banks facing the sun, would do well to try them if they have not already done so. The finest displays I have ever seen have been in a bed on a lawn sloping to the south, and getting the sun practically the whole day, and on a narrow border under the front windows of a house facing south, where they had the added radiation of heat from the wall. Although they will grow on thin dry soils they pay for a little special attention in preparing beforehand some depth of well-cultivated, if not rich, soil, when they will cover the ground with a beautiful floral carpet, the rich colouring of the blooms twinkling in the sun.

Seed can be sown in the open ground on a warm border from the end of April to the middle of May, according to the season, avoiding cold damp weather, if possible, as in that case the seed may rot in the ground. Better results are, however, obtained by sowing the seed very thinly in pans of light soil in a frame early in April, and pricking them out into boxes or other pans as soon as they are large enough to handle, care being taken to give them plenty of air and keep them near the glass. As soon as they are well established and growing freely they should be potted up in small sixties, in light rich soil, and grown on steadily until all danger of frost is over. They are not plants for dotting about on borders, but for planting in bold masses in the sunniest positions in the garden. There are both single and double kinds of all colours, from crimson and white to pure yellow.

Alger Petts.

NORTHAMPTON MUNICIPAL
HORTICULTURAL SOCIETY.

GRAND EXHIBITION OF
FLOWERS, FRUITS,
AND VEGETABLES,
August 3rd and 4th, 1910.
at
ABINGTON PARK, NORTHAMPTON.

Prizes to the value of £300.

Schedules on application to
JAS. B. PALMER, Secretary,
36, Cyril Street, Northampton.

THE YORKSHIRE SWEET PEA SOCIETY.—The above society will hold their EXHIBITION on the 20th and 21st July, 1910, in the ASSEMBLY ROOMS, BEVERLEY. Cups and valuable prizes will be awarded. For Schedules apply H. G. SUMPNER, 1, Grovehill Road, Beverley.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

There was a splendid show on February 22, consisting largely of orchids, rock and alpine plants, with forced shrubs. So great was the crowd during the afternoon that locomotion was most difficult, and this, too, at the time that the lecture room was equally full.

FLORAL COMMITTEE.

Messrs. Sutton and Sons, Reading, arranged a large display of primulas in five-inch pots. The colours were blocked in masses, the whole making a bright exhibit. Needless to say, the plants were in the pink of condition, each being quite a specimen in its way. The most conspicuous were Crimson King, Giant White, especially good in truss, Giant Crimson, and Salmon Pink, while the variety Coral Pink was most pleasing in colour. The same firm also presented groups of bedding hyacinths, arranged according to their colour scheme, thus we had semi-circular groups of mauve shades, pink, and pale blue, red and cream, and so on, the combinations being most pleasing and effective. Tulip Fairy Queen was arranged between the groups, and acted as a foil to the hyacinths.

From Messrs. Wm. Paul and Son, Waltham Cross, came a fine group of camellias, chiefly as specimens in pots, while the foreground was occupied with cut flowers in boxes. The plants were particularly well flowered, and evidently had not suffered through travelling. Fine plants of Alba plena, Madame A. Verschaffelt, Mercury, Mars, Chandleri, and Tricolour were noted, while in the boxes were seen Mathotiana, Fimbriata, and Minerva as the most prominent varieties. Hardy flowers were well staged by Messrs. Barr and Sons, Covent Garden, the leading features being hellebores in variety, irises, Cyclamen coum, and Polyanthus narcissi, well flowered in bowls, the whole being arranged with appropriate plants and foliage.

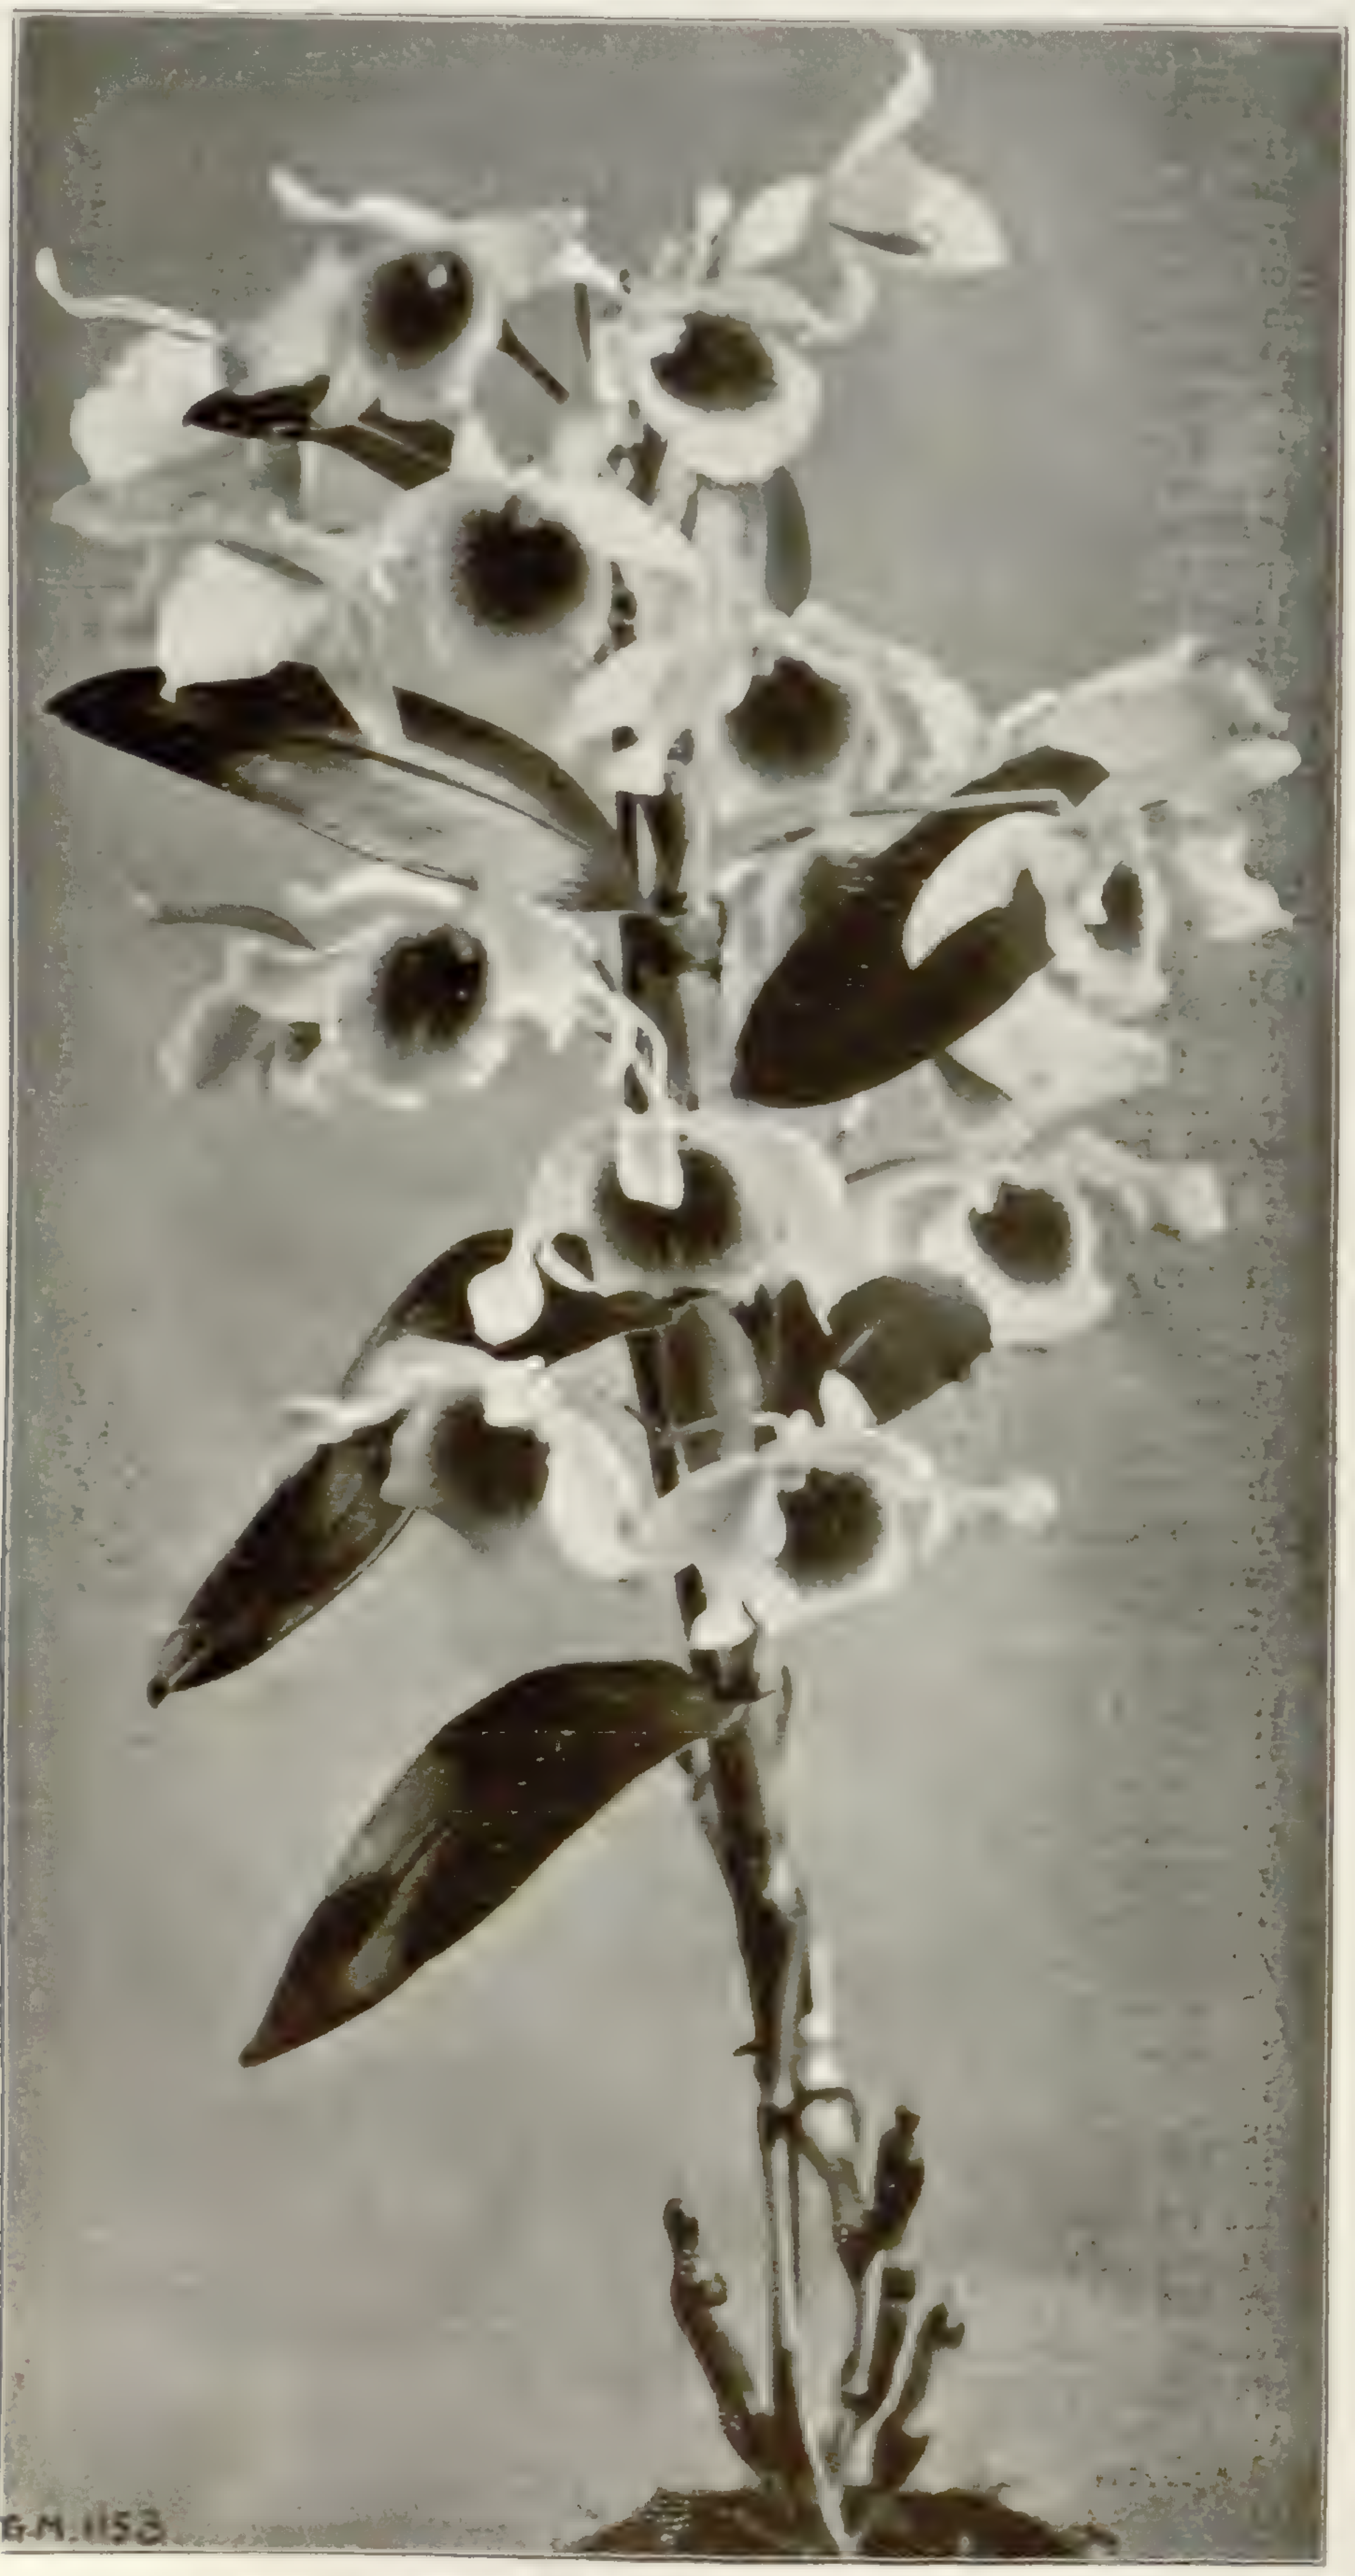
Messrs. H. Cannell and Sons, Swanley, presented a nice table of cut zonal pelargoniums, the colours being simply wonderful for the season, the most conspicuous being London, Dublin, New York, and the Duke of Connaught, but all were excellent.

The Misses Hopkins, Mere Gardens, Shepperton-on-Thames, had a small exhibit of spring flowers, such as hellebores, primroses, and saxifragas, arranged in a natural style.

From Mr. J. Strange (gardener, Mr. W. Dyson), Sulhampstead, came an exhibit of twelve cyclamen in various colours, which were reputed as scented; in any case, the plants were well grown.

A fine exhibit of ferns was that from Messrs. J. Hill and Son, Barrowfield Nurseries, Lower Edmonton. It occupied the top end of the hall, and was noticeable for the fine specimens it contained. Dicksonia antarctica, Nephrolepis todeaoides, Platycerium grande, Nephrolepis exaltata superba, were most conspicuous, while a collection of decorative ferns were used to good effect.

Hardy flowers came from Messrs. G. Jackman and Son, Woking. The natural arrangement being built up with hellebores, Cyclamen coum, primulas, some nice clumps of ericas, and saxifragas.



DENDROBIUM MRS. FENTON HORTON.

A beautiful hybrid, shown by **Sir J. Colman, Bart., at R.H.S. Meeting on Tuesday last, when it received an Award of Merit.**

Groups of forced shrubs and trees occupied one side of the hall, and made a fine feature. Messrs. James Veitch and Sons, Lim., Chelsea, arranged an effective group, in which the wistarias were most telling. Large plants of Forsythia suspensa, lilacs in variety, with a fine clump of Prunus pseudo-cerasus Watereri were very fine; while plants of Choisya ternata were conspicuous, the bamboos employed with the ferns and other foliage plants all added to the effect.

Messrs. R. and G. Cuthbert, Southgate, had a fine group of Azalea mollis, grouped in colours, and numbers of Acer palmata seedlings were employed to produce a bronzy effect, the arrangement throughout being well carried out. Tall dot standard Prunus triloba, lilacs, etc., with the tall cocos used as a background all added to the effect.

A similar group came from Mr. L. R. Russell, Richmond, who had a well-arranged exhibit of Azalea mollis in variety, lilacs in splendid form, Azalea amoena Hexe, and Forsythia suspensa.

Messrs. R. Gill and Sons, Penryn, Cornwall, had a table of rhododendrons, which had been cut in the open air without the aid of any protection. The trusses were well developed, and the best were R. barbatum, R. H. Shilston, R. Harrisi, and a number of R. arboreum seedlings, together with some fine bunches of Cyclamen coum, and Violets Princess of Wales.

Messrs. J. Cheal and Sons, Crawley, were represented with a most artistic rock arrangement, on which were placed Rhododendron praecox, Azalea Lady [illegible], a Japanese variety with semi-double lilac flowers, while tulips, hellebores, irises and saxifragas were judiciously employed.

From the Guildford Hardy Plant Company, Guildford, came a natural display of rock and alpine plants.

Mr. H. Burnett, St. Margaret's, Guernsey, staged a beautiful display of carnations, which were remarkable for size and brilliant colouring. The most striking were W. J. Hunter, The Mikado, Mrs. H. Burnett, R. F. Felton, Britannia, and some very promising seedlings.

A very pleasing exhibit of ferns came from Messrs. H. B. May and Sons, Upper Edmonton, most of which were specimen plants. The most prominent were Dicksonia antarctica, D. squarrosa, Nephrolepis todeaoides, N. superbissima, and Pteris Summersi; while the smaller plants were chiefly of a decorative character, the whole forming a very fine table.

Mr. W. Seward, The Beeches, Hanwell, staged a splendid table of cyclamen in five-inch pots. The plants were remarkably well grown, and the colours embraced all the popular varieties, a most creditable example of cultural skill.

Another fine exhibit of carnations in vases came from Messrs. W. Cutbush and Sons, Highgate. The same firm also had a nice exhibit of hardy plants, arranged in natural style. Here were seen Arabis rosea, Anemone blanda, Tulipa Kauffmani, and some good forced shrubs, made a most attractive background.

Mr. G. Reuthe, Hardy Plant Nursery, Keston, made an interesting exhibit of hardy plants. The rhododendrons, with their handsome foliage, were very fine. Other features were Iris Bakeriana, crocuses in variety, anemones, and good coloured hepaticas

A good table of freesias came from Mr. H. S. Barton, Hewsholt, Liphook, Hants (gardener, Mr. Streeter), who also utilised yellow tulips, and white Italian hyacinths with decorative effect.

Messrs. G. Mount and Sons, Lim., Canterbury, sent a pretty exhibit of cut roses. They were staged in Messrs. Mount's well-known style. The high colour and beautiful foliage being much admired, the chief varieties being Joseph Lowe, Richmond, Mrs. W. J. Grant, and Liberty; also as a centrepiece, a seedling unnamed, rich deep apricot in colour, a long pointed bud, and evidently a good grower, reputed to be a cross between Papa Gontier and Madame Hoste.

Messrs. James Veitch and Sons had a whole table filled with cyclamen, arranged in blocks of separate colours, the most prominent being Salmon, Giant White, Brilliant, Excelsior, and the butterfly forms; while on the opposite table were to be seen Boronias heterophylla and megastigma, Coleus thyrsoideus and Primula Kewensis, with some well-flowered plants of Azalea indica. Quite a new feature was instituted by Messrs. J. Carter and Co., High Holborn, who produced a natural waterfall, with a pool, around which were arranged with much taste primulas, hepaticas, hardy ferns, scillas, and a variety of other plants, the whole forming a most attractive exhibit.

From Messrs. S. Low and Co., Bush Hill Park, N., came a charming exhibit of carnations, arranged in vases and bowls. The most striking were Royal Purple, Mikado, White Perfection, Rival, Marmion, and Britannia. The rest of the exhibit was comprised of azaleas in variety, cyclamen, ericas, and daphnes.

Messrs. Heath and Co., Cheltenham, arranged a rock and alpine exhibit, on which were arranged a number of suitable plants, while from the Craven Nurseries, Clapham, Yorks, came a similar exhibit, in which the saxifragas were the chief features; the variety S. Burseriana Gloria was most conspicuous.

Messrs. T. S. Ware, Lim., Feltham, made a nice display of rock and alpine plants. A clump of Iris fimbriata, with a large number of hellebore hybrids, were quite a feature, as were also the saxifragas and Pulmo-

☛ **IN THE HIGH COURTS OF JUSTICE**

Edinburgh, an Action brought by CHAS. P. KINNELL & CO., Ltd., against A. Ballantine & Sons, Boness, N.B., resulted in a judgment in favour of Plaintiffs, interdicting and prohibiting the Defendants from using the words "HORSE SHOE" as descriptive of, or in connection with boilers NOT BEING OF THE PLAINTIFFS' MANUFACTURE, sold or offered for sale by the Defendants without clearly distinguishing such boilers from the boilers of the Plaintiffs.

WE WARN BUYERS AND THE TRADE THAT PROCEEDINGS WILL AT ONCE BE TAKEN AGAINST ANYONE INFRINGING OUR RIGHT.

NO BOILERS ARE

"HORSE SHOE" BOILERS

UNLESS THEY HAVE THE NAME CHAS. P. KINNELL & CO., LTD., CAST UPON THE FRONT, and buyers will protect themselves and our rights by at once intimating to us if any attempt is made to pass off as a "HORSE SHOE" boiler, any boiler not being of our manufacture.

IMITATION IS THE SINCEREST FORM OF FLATTERY, but unscrupulous traders for a little extra profit may try to pass off another boiler, which has not all OUR IMPROVEMENTS, as being "just as good."

GET A "HORSE SHOE" BOILER AND ENSURE THE BEST RESULTS.

It has taken years of experience to perfect it, and its NAME "HORSE SHOE" is the "Hall Mark" of EXCELLENCE.

Information as to any attempted infringement of our rights will be gratefully received by

naria rubra, which was represented by a large clump.

FRUIT AND VEGETABLE COMMITTEE.

This body had very little to do on this occasion. A number of seedling apples were submitted, but there was nothing left for the Press or general public to inspect, as no awards were made, it must be assumed that they were not considered worthy of recognition.

A very interesting exhibit of leeks came from the R.H.S. Gardens at Wisley. The whole collection gave evidence of cultural skill; perhaps the best were Giant Italian Winter Leek, Ayton Castle, Musselburgh, Barr's No. 2, and Barr's Selected Prizetaker.

Mr. W. Poupart, Twickenham, staged a fine exhibit of bottled fruits, which was composed of a large variety of plums, gooseberries, currants, raspberries, loganberries, peaches, and similar subjects. The whole were in perfect condition, and admirably staged.

Messrs. Sutton and Sons, Reading, had a fine exhibit of their broccoli Superb Early White, arranged in baskets. The heads were of medium size, good in colour, and what is of more importance still, had received no protection whatever.

ORCHID COMMITTEE.

The finest feature of the meeting was a superb bank of orchids from Sir J. Colman, Bart., Gatton Park, Surrey (gardener, Mr. J. Collier). Dendrobiums were, perhaps, the chief feature, and they were utilised freely throughout the entire group. From a purely cultural point of view, they were simply wonderful; while with the skill displayed in the grouping the whole formed one of these valuable exhibits seen from time to time at the hall. The huge central portion was formed with long racemes of calanthes in variety, with large plants of Odontoglossum Edwardsi, while the beautiful Spathoglottis Colmani were interspersed freely between them, the whole rising out of a bed of ferns and moss. Of the dendrobiums noted were D. Ainsworthi Hazelton var., D. Wiganianum aureum, D. Melanophelmum, D. nobile alba in quantity, D. Chessingtonensis, and the beautiful D. Lady Colman. Well-flowered pans of Cœlogyne cristata Lemoinei, some beautiful examples of miltonias, Sophro-lælia Marriottiana, with rich flowers; and Cymbidium Gattonense, Odontoglossum Wilckeanum, Odontioda Bradshawiæ were conspicuous. In fact, the whole group was a great source of admiration. From Messrs. Charlesworth and Co., Haywards Heath, came an exhibit of fine quality. Odontioda Keighleyensis was very rich in colour, O. Charlesworthi was in fine condition, O. Bradshawiæ was also noted, as were also fine examples of Miltonia Bleuana var. Lælia cinnabarina, and L. c. Hypatia, very rich in colour; some very good cattleyas were also seen in this group.

Messrs. Sander and Sons, St. Albans, also arranged an exhibit in their best style. The pretty little Dendrobiums velutinum with Odontoglossum Black Prince, and Odontioda cupreum. Dendrobium Phalænopsis Schroderianum formed a pleasing group, exhibiting many shades. Odontoglossums in variety, cattleyas, and the quaint Pleurothallis Roezli were all good.

From Messrs. Stuart Low and Co., Bush Hill Park, came a display of dendrobiums in variety; Cattleya Trianæ Monarch was very fine, as were also examples of L.-c. Lucasiana, Odontoglossum nebulosum, Cattleya Schroderæ, and a variety of cypripediums.

Messrs. Mansell and Hatcher, Lim., Rawdon, Yorks., staged some good dendrobiums and cypripediums in variety, a nice piece of Brasso-cattleya Mendelli Digbyana was pure white, while Cypripedium Leeanum Purity was very distinct.

Mr. E. V. Low, Haywards Heath, exhibited cattleyas in variety, Odontoglossum crispum Raymond Crawshay, with a few cypripediums, in which the var. Surprise was most notable. Mr. H. T. Pitt, Stamford Hill, sent Cymbidium Lowigrinum Rosslyn var., citron yellow, with the lip beautifully marked with purple. From Mons. Mertens, Mont St. Amand, Ghent, came a table of choice and well-grown odontoglossums, superb in colouring; also a few cattleyas.

Messrs. James and A. A. McBean, Cooksbridge, staged Cymbidium insigne, odontoglossums in variety, well grown, also cypripediums and Cattleya Schroderæ.

Mr. James Cypher, Cheltenham, had a group particularly rich in cypripediums, which included C. Thomsoni, C. Actæus, C. chrysotranum, and C. Master-exul, a beautiful variety of Lycaste Skinneri, and some good dendrobiums.

CERTIFICATES AND AWARDS.

First-Class Certificates. — To Odontoglossum splendens, from Messrs. Sander and Sons, St. Albans.

Award of Merit.—To Odontoglossum eximium E. C. Rogerson, from Mr. E. Rogerson; Dendrobium, Mrs. Fenton Horton, from Sir J. Colman, Bart.; Odontoglossum Black Prince, from Messrs. Sander and Sons; Cattleya Schroderæ, The Prince, from Mr. H. S. Goodson, Putney; Lisa lacera multifida, from Messrs. Charlesworth and Co., Haywards Heath; Odontoglossum Ceres, from Messrs. Charlesworth and Co.; Carnation Mrs. Tatton, from Mr. H. Burnett, Guernsey.

MEDALS.

Gold.—Sir J. Colman, Bart., for group of orchids; Messrs. Jas. Veitch and Sons, Lim., Chelsea, for forced trees, etc.

Silver-Gilt Flora.—Messrs. R. and G. Cuthbert, Southgate, for azaleas, etc.; Messrs. J. Hill and Son, Edmonton, for ferns; Mr. W. Seward, Hanwell, for cyclamen; Miss Gundry, Foots Cray, for water colour drawings.

Silver-Gilt Banksian.—Messrs. W. Cutbush and Sons, Highgate, for alpines, etc.; Messrs H. B. May and Sons, Upper Edmonton, for ferns.

Silver Flora.—Messrs. Charlesworth and Co., for orchids; Messrs. Sander and Son, St. Albans, for orchids; Messrs. Stuart Low and Co., Bush Hill Park, for orchids; Mr. H. Burnett, Guernsey, for carnations; Messrs. J. Gill and Son, Falmouth, for rhododendrons; Messrs. Stuart Low and Co., Bush Hill Park, for cyclamen, etc.; Mr. W. Paul, Waltham Cross, for camellias; Mr. L. R. Russell, Richmond, for flowering shrubs; Messrs. Sutton and Sons, Reading, for primulas and hyacinths.

Silver Banksian.—Messrs. Carter and Co., High Holborn, for alpines; Messrs. Barr and Sons, Covent Garden, for bulbous plants; Messrs. J. Cheal and Sons, Crawley, for alpines; Messrs. G. Mount and Sons, Canterbury, for roses; Mr. G. Reuthe, Keston, for alpines; Messrs. Cypher and Sons, for orchids; Mr. E. V. Low, Haywards Heath, for orchids; Messrs. Mansell and Hatcher, Rawdon, for orchids; Messrs. J. and A. A. McBean, Cooksbridge, for orchids; Mr. W. Poupart, Twickenham, for bottled fruits.

Cultural Commendation.—The R.H.S. Gardens, Wisley, for collection of leeks; to Messrs. Sutton and Sons, Reading, for broccoli.

Beckenham Horticultural Society.

On Friday, the 18th inst., Mr. W. Rowson, of Falkland Park Gardens, South Norwood, lectured to a very full room on "Manures, Organic and Mineral," Mr. Murrells presiding. The lecturer first drew attention to farmyard manures, their composition and treatment in making. Where only consisting of horse manure, as is the case in many places, garden refuse, and even garden soil, should be mixed with it, and well compressed to lessen the possibility of its becoming "fire forged." If cow and pig manure form a portion, they being of a cooler, moister nature, would temper the horse manure. Of phosphatic manures, superphosphate of lime was best used for farm purposes, and bonemeal for the garden proper. Sulphate of potash had given good results for onions. Kainit was advised for asparagus beds. Something was said of nitrate of soda, sulphate of ammonia, Peruvian guano, their origin and how obtained. A good discussion followed, and at the close a hearty vote of thanks was accorded Mr. Rowson.

Mr. J. Green, a member of the committee, who is leaving the neighbourhood to take up duties near Salisbury, was presented with a certificate, embodying the best wishes of his co-workers here.

Bournemouth Gardeners' Association.

FEBRUARY 15.

On the above date Mr. Herbert W. Ely, of the Victoria League, gave a very interesting lecture on "Tasmania, and its Fruit Industry." There was a large attendance of members and their friends, as this lecture was open to the public also. Mr. R. V. Sherring, F.L.S., occupied the chair and introduced the lecturer, who gave some very useful and interesting information about a country which, he said, had a climate very similar to that of England, only not quite so variable, and, furthermore, the nights, even in the hottest part of the year, were always cool, never unpleasantly close, as is sometimes the case in this country. Tasmania, a little less in size than Ireland, had a Government that gave every assistance to horticulture, sending experts out to give advice both to persons who are established in their business and to others who are intending settlers. Mr. Ely gave the average temperatures as follows: Spring, 54 degrees; summer, 62 degrees; autumn, 55 degrees; and winter, 45 degrees; with a rainfall for the whole year of from 30 to 35 inches. The population was 187,000, and the annual commerce of the country about £9,000,000 sterling. In many parts of the country the scenery was most charming, and one could quite understand it was so from the many views thrown on the screen.
